

Study of Light scalar mesons from heavy quark decays

Cai-Dian Lü (呂才典)
IHEP, Beijing

Wei Wang, CDLu, arXiv:0910.0613 [hep-ph]

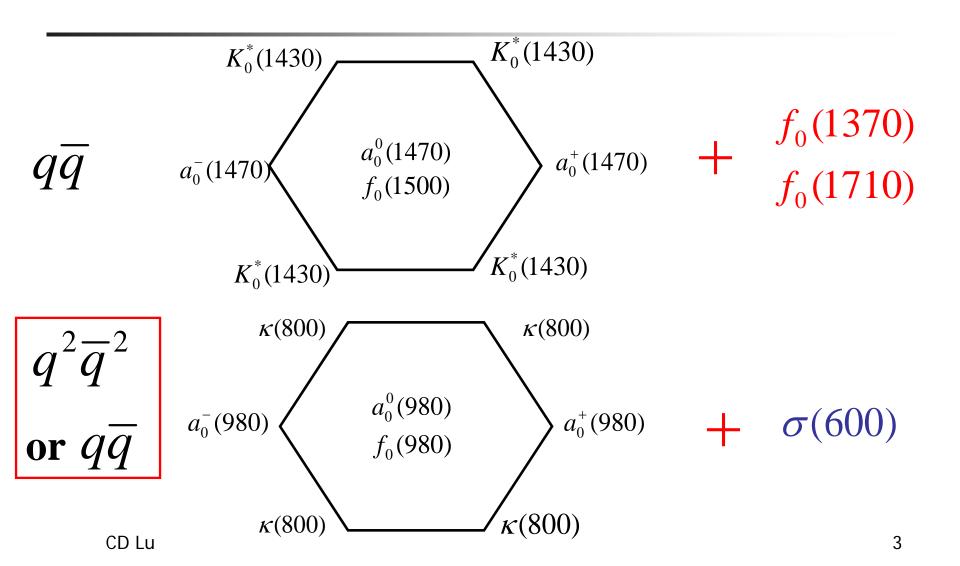

Outline

- Scalar meson study status
- Four quark states or two-quark states: semileptonic decays
- Non-leptonic decays

Summary

Scalar Mesons (JP=0+)

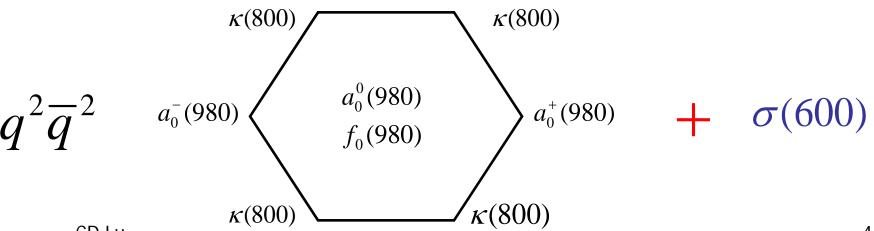

Scalar Mesons around 1GeV (JP=0+)

σ exist or not for many years

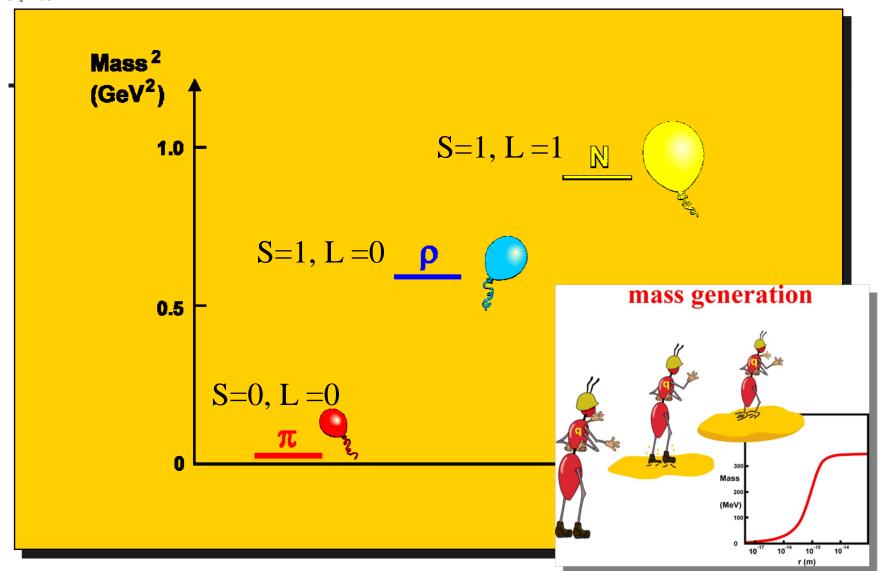

Mass too light to be $q\overline{q}$

Because 0^{++} states are S=1, L=1, should be heavier than 1^{-} (ρ , ϕ K*)

Hadron masses ²

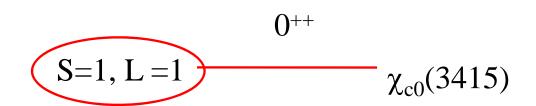

Comparison with $\overline{c}c$ family

$$S=1, L=1 - \frac{0^{++}}{\chi_{c0}(3415)}$$

$$S=1, L=0$$
 ______ $J/\psi(3097)$
 $S=0, L=0$ ______ $\eta_c(2980)$

Comparison with $\overline{c}c$ family

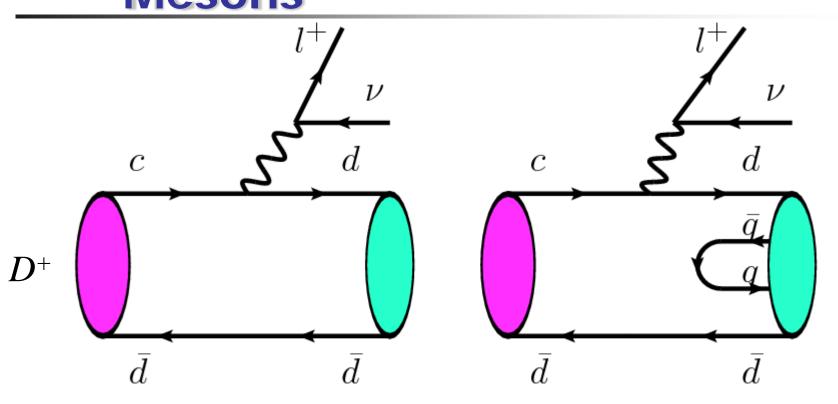

$$S=1,\,L=0 \qquad \qquad \frac{1^{--}}{0^{-+}} \qquad J/\psi(3097)$$

$$S=0,\,L=0 \qquad \qquad \eta_c(2980)$$

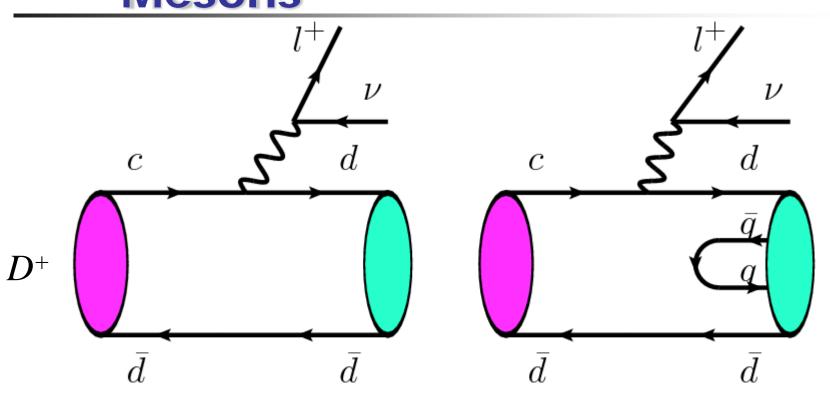

The neutral scalar mesons 0++ has the same quantum number with vacuum

- They can mix with vacuum, glueball, even molecular states
- So a lot of explanations on the market tetra quark states
- Most study focus on the decay property of the scalar mesons
- The production of scalar mesons from heavy quark decays are more interesting

Feynman diagrams of semileptonic decays of D to Scalar Mesons

Feynman diagrams of semileptonic decays of D to Scalar Mesons

 $D^+ \rightarrow f_0 \pi^+, D^+ \rightarrow \sigma \pi^+$ have been measured

2-quark picture of ordinary light Scalar Mesons

$$|\sigma\rangle = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle + |\bar{d}d\rangle) \equiv |\bar{n}n\rangle, \quad |f_0\rangle = |\bar{s}s\rangle, \quad (1)$$

$$|a_0^0\rangle = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle - |\bar{d}d\rangle), \quad |a_0^-\rangle = |\bar{u}d\rangle, \quad |a_0^+\rangle = |\bar{d}u\rangle$$

σ - f_0 mixing:

$$\begin{vmatrix} f_0 \\ \sigma \end{vmatrix} = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{vmatrix} \begin{vmatrix} \frac{1}{ss} \\ -nn \end{vmatrix}$$

with

$$25^{\circ} < \theta < 40^{\circ}, \quad 140^{\circ} < \theta < 165^{\circ}$$

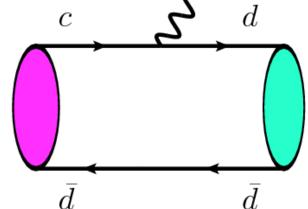

2-quark picture of ordinary light Scalar Mesons

$$|\sigma\rangle = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle + |\bar{d}d\rangle) \equiv |\bar{n}n\rangle, \quad |f_0\rangle = |\bar{s}s\rangle, \quad (|a_0\rangle) = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle - |\bar{d}d\rangle), \quad |a_0\rangle = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle - |\bar{d}u\rangle - |\bar{d}u\rangle + |\bar{d}u\rangle +$$

σ - f_0 mixing:

$$\begin{vmatrix} f_0 \\ \sigma \end{vmatrix} = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{vmatrix} \begin{vmatrix} \frac{1}{ss} \\ -nn \end{vmatrix}$$
with

$$25^{\circ} < \theta < 40^{\circ}, \quad 140^{\circ} < \theta < 165^{\circ}$$

2-quark picture of Scalar Mesons

only dd component contribute, in isospin symmetry, we have

$$\mathcal{A}(D^+ \to f_0 l^+ \nu) = -\sin\theta \hat{\mathcal{A}},$$

 $\mathcal{A}(D^+ \to \sigma l^+ \nu) = -\cos\theta \hat{\mathcal{A}}$

where

$$\hat{\mathcal{A}} \equiv \mathcal{A}(D^+ \to a_0^0 l^+ \nu)$$

Br ~ $|A|^2$, We can get sum rule as

$$\mathcal{B}(D^+ \to a_0^0 l^+ \nu) = \mathcal{B}(D^+ \to f_0 l^+ \nu) + \mathcal{B}(D^+ \to \sigma l^+ \nu)$$

Hadronic picture

- Isospin 0 and isospin 1 contribution should be 1:1, derived from the Clebsch-Gordan coefficients
- Isospin conserved by strong interaction, no matter perturbative or non-perturbative

--model independent

similarly, $B^+/D^+ \to \rho e^+ \nu_e = B^+/D^+ \to \omega e^+ \nu_e$ already verified by exp.

4-quark picture of ordinary light Scalar Mesons

$$|\sigma\rangle = \bar{u}u\bar{d}d, \quad |f_0\rangle = |\bar{n}n\bar{s}s\rangle, \quad \text{assignment}$$

Group theory assignment

(5)

$$|a_0^0\rangle = \frac{1}{\sqrt{2}}(\bar{u}u - \bar{d}d)\bar{s}s, \quad |a_0^+\rangle = |\bar{d}u\bar{s}s\rangle, \quad |a_0^-\rangle = |\bar{u}d\bar{s}s\rangle$$

σ - f_0 mixing:

$$\begin{vmatrix} f_0 \\ \sigma \end{vmatrix} = \begin{pmatrix} \cos \phi & \sin \phi \\ -\sin \phi & \cos \phi \end{vmatrix} \begin{vmatrix} --- \\ nnss \\ --- \\ uudd \end{vmatrix}$$

with

$$\phi = (174.6^{+3.4}_{-3.2})^{\circ}$$

$$n\overline{n} = \frac{u\overline{u} + d\overline{d}}{\sqrt{2}}$$

4-quark picture of ordinary light Scalar Mesons

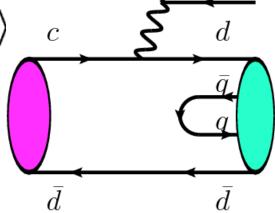

$$|\sigma\rangle = \bar{u}u\bar{d}d, \quad |f_0\rangle = |\bar{n}n\bar{s}s\rangle,$$

Group theory

$$|\sigma\rangle = \bar{u}u\bar{d}d, \quad |f_0\rangle = |\bar{n}n\bar{s}s\rangle,$$
 assignment $|a_0^0\rangle = \frac{1}{\sqrt{2}}(\bar{u}u - \bar{d}d)\bar{s}s, \quad |a_0^+\rangle = |\bar{d}u\bar{s}s\rangle$

σ - f_0 mixing:

$$\begin{vmatrix} f_0 \\ \sigma \end{vmatrix} = \begin{pmatrix} \cos \phi & \sin \phi \\ -\sin \phi & \cos \phi \end{vmatrix} \begin{vmatrix} --- \\ nnss \\ --- \\ uudd \end{vmatrix}$$

$$\phi = (174.6^{+3.4}_{-3.2})^{\circ}$$

$$n\overline{n} = \frac{u\overline{u} + dd}{\sqrt{2}}$$

4-quark picture of Scalar Mesons

$$\mathcal{A}(D^+ \to f_0 l^+ \nu) = -(\cos \phi + \sqrt{2} \sin \phi) \hat{\mathcal{A}}$$
$$\mathcal{A}(D^+ \to \sigma l^+ \nu) = (\sin \phi - \sqrt{2} \cos \phi) \hat{\mathcal{A}},$$

where

$$\hat{\mathcal{A}} \equiv \mathcal{A}(D^+ \to a_0^0 l^+ \nu)$$

We can get sum rule as

$$\mathcal{B}(D^+ \to a_0^0 l^+ \nu) = \frac{1}{3} [\mathcal{B}(D^+ \to f_0 l^+ \nu) + \mathcal{B}(D^+ \to \sigma l^+ \nu)]$$

Define a ratio R

$$R = \frac{\mathcal{B}(D^+ \to f_0 l^+ \nu) + \mathcal{B}(D^+ \to \sigma l^+ \nu)}{\mathcal{B}(D^+ \to a_0^0 l^+ \nu)}.$$

It is one for 2-quark picture, while 3 for 4-quark picture

Similarly, for B meson decays, we have

$$R = \frac{\mathcal{B}(B^{+} \to f_{0}l^{+}\nu) + \mathcal{B}(B^{+} \to \sigma l^{+}\nu)}{\mathcal{B}(B^{+} \to a_{0}^{0}l^{+}\nu)}$$
$$= \begin{cases} 1 & \text{two quark} \\ 3 & \text{tetra-quark} \end{cases}.$$

These channels have large enough BRs to be measurable

If the mixing angle is modest, all three $D^+ \to Sl^+\nu$ have similar branching ratios. The branching ratio of the semileptonic $D_s \to f_0$ decay is measured [9] as

$$\mathcal{B}(D_s \to f_0 l \bar{\nu}) \times \mathcal{B}(f_0 \to \pi^+ \pi^-)$$

= $(2.0 \pm 0.3 \pm 0.1) \times 10^{-3}$. (16)

Thus as an estimation, branching ratios for the cascade $D^+ \to Sl^+\nu$ decays are expected to have the order

$$\frac{V_{cd}^2}{V_{cs}^2} \times 2 \times 10^{-3} \sim 1 \times 10^{-4}.$$
 (17)

As for the B decays, the branching ratio of $B \to Sl\bar{\nu}$ can be estimated utilizing the $B \to \rho l\bar{\nu}$ and $D_s^+ \to \phi l^+\nu$ decays. If the mixing angle is moderate, the branching ratio can be estimated as

$$\mathcal{B}(B \to f_0 l \bar{\nu}) \sim \mathcal{B}(B \to \rho l \bar{\nu}) \frac{\mathcal{B}(D_s \to f_0 l \bar{\nu})}{\mathcal{B}(D_s \to \phi l \bar{\nu})}$$

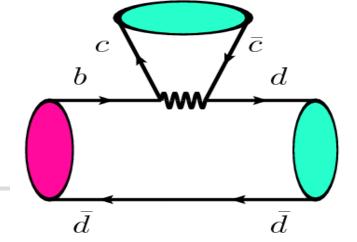

$$\sim 10^{-4} \times \frac{10^{-3}}{10^{-2}} = 10^{-5}. \tag{18}$$

Compared with the recently measured semileptonic $B \rightarrow \eta$ decay [11]

$$\mathcal{B}(B^- \to \eta l^- \bar{\nu}) = (3.1 \pm 0.6 \pm 0.8) \times 10^{-5}, (19)$$

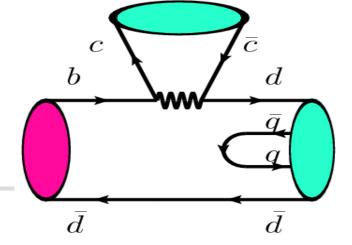

$B \rightarrow J/\psi (\eta_c) f_0$

- Semileptonic B decays $B^+ o f_0 l^+ v_l$ are clean, but the neutrino is identified as missing energy, thus the efficiency is limited
- The lepton pair can also be replaced by a charmonium state such as J/ψ, since J/ψ does not carry any light flavor either.
- $B \rightarrow J/\psi f_0$ decays may provide another ideal probe to detect the internal structure of the scalar mesons.

$B \rightarrow J/\psi (\eta_c) f_0$

- Semileptonic B decays $B^+ o f_0 l^+ \nu_l$ are clean, but the neutrino is identified as missing energy, thus the efficiency is limited
- The lepton pair can also be replaced by a charmonium state such as J/ψ, since J/ψ does not carry any light flavor either.
- $B \rightarrow J/\psi f_0$ decays may provide another ideal probe to detect the internal structure of the scalar mesons.

$B \rightarrow J/\psi(\eta_c) S$

$$R = \frac{\mathcal{B}(\bar{B}^0 \to f_0 J/\psi) + \mathcal{B}(\bar{B}^0 \to \sigma J/\psi)}{\mathcal{B}(\bar{B}^0 \to a_0^0 J/\psi)} = 1 \quad (20)$$

in the $\bar{q}q$ picture, and

$$R = \frac{\mathcal{B}(\bar{B}^0 \to f_0 J/\psi) + \mathcal{B}(\bar{B}^0 \to \sigma J/\psi)}{\mathcal{B}(\bar{B}^0 \to a_0^0 J/\psi)} = 3 \quad (21)$$

in the $\bar{q}q\bar{q}q$ picture. Although these are hadronic decays

The branching fraction is expected to have the order

$$\mathcal{B}(B \to f_0 J/\psi) \sim \mathcal{B}(\bar{B}^0 \to \rho^0 J/\psi) \frac{\mathcal{B}(D_s \to f_0 l \bar{\nu})}{\mathcal{B}(D_s \to \phi l \bar{\nu})}$$

 $\sim 10^{-5} \times \frac{10^{-3}}{10^{-2}} = 10^{-6}.$ (22)

On experimental side, the J/ψ is easily detected through a lepton pair l^+l^- and thus this mode may be more useful. If the J/ψ meson is replaced by η_c in eq.(20,21), one can get the similar sum rules.

Uncertainties mainly from SU(3) breaking

- Form factor difference no problem, since it makes the R for 4-quark picture even larger than 3
- Mostly by mass difference, only problem: $m_{\sigma} = (0.4 \sim 1.2)$ GeV, but any way phase space is easy to calculate
- Relatively large uncertainty in D decays. But in B decays, there is no problem, since m_σ negligible
- Governed by heavy quark effective theory, the SU(3) breaking is suppressed by 1/m_o

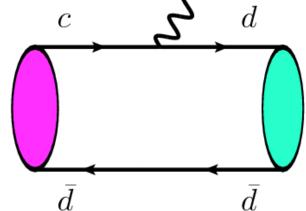

2-quark picture of ordinary light Scalar Mesons

$$|\sigma\rangle = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle + |\bar{d}d\rangle) \equiv |\bar{n}n\rangle, \quad |f_0\rangle = |\bar{s}s\rangle, \quad (|a_0\rangle) = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle - |\bar{d}d\rangle), \quad |a_0\rangle = \frac{1}{\sqrt{2}}(|\bar{u}u\rangle - |\bar{d}u\rangle - |\bar{d}u\rangle + |\bar{d}u\rangle - |\bar{d}u\rangle + |\bar{d}u\rangle - |\bar{d}u\rangle + |\bar{d}u\rangle - |\bar{d}u\rangle + |\bar{d}u\rangle +$$

σ - f_0 mixing:

$$\begin{vmatrix} f_0 \\ \sigma \end{vmatrix} = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{vmatrix} \begin{vmatrix} \frac{1}{ss} \\ -nn \end{vmatrix}$$
with

$$25^{\circ} < \theta < 40^{\circ}, \quad 140^{\circ} < \theta < 165^{\circ}$$

2-quark picture of Scalar Mesons

only dd component contribute, in SU(3) symmetry, we have

$$\mathcal{A}(D^+ \to f_0 l^+ \nu) = -\sin\theta \hat{\mathcal{A}},$$

 $\mathcal{A}(D^+ \to \sigma l^+ \nu) = -\cos\theta \hat{\mathcal{A}}$

where

$$\hat{\mathcal{A}} \equiv \mathcal{A}(D^+ \to a_0^0 l^+ \nu)$$

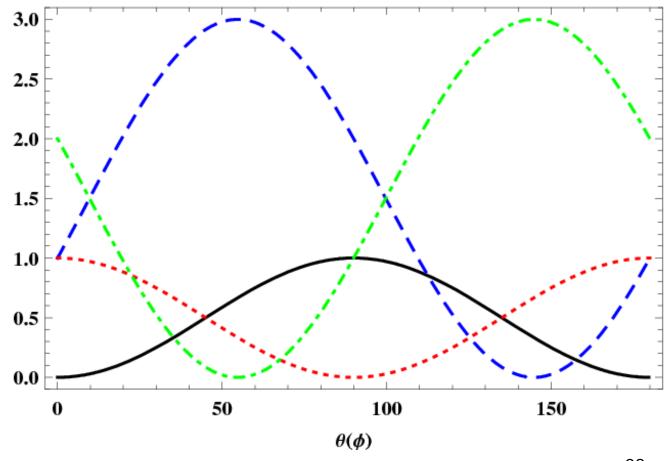

Br ~ $|A|^2$, We can get s sum rule as

$$\mathcal{B}(D^+ \to a_0^0 l^+ \nu) = \mathcal{B}(D^+ \to f_0 l^+ \nu) + \mathcal{B}(D^+ \to \sigma l^+ \nu)$$

$$R_{f_0} = \frac{\mathcal{B}(D/B \to f_0 l \nu)}{\mathcal{B}(D/B \to a_0^0 l \nu)} \left(R_{f_0} = \frac{\mathcal{B}(B \to f_0 J/\psi)}{\mathcal{B}(B \to a_0^0 J/\psi)} \right)$$

The measurem ent of ratio R can determine the mixing angle of fo and σ

Summary

- The semi-leptonic decays of D and/or B mesons to scalar mesons can provide a theoretically clean way to distinguish the 2quark and 4-quark picture of light scalar mesons
- So as the non-leptonic decays of B \rightarrow J/ $\psi(\eta_c)$ S
- **They can also be used to measure the** mixing angle between f_0 and σ

Thank you!
