Comparison to Semiclassics

Summary

- In full correspondence with the theme of the workshop, we want to compute matrix elements.

# Statement of the Problem

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- In full correspondence with the theme of the workshop, we want to compute matrix elements.
- We take the example of the Lieb-Liniger model.

# Statement of the Problem

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- In full correspondence with the theme of the workshop, we want to compute matrix elements.
- We take the example of the Lieb-Liniger model.
- For brevity, it's an algebraic R-matrix, with real Bethe roots only.

# Statement of the Problem

Problem

The Functional  
Approach

Saddle Point

Comparison to  
Semiclassics

Summary

- We wish to compute  $\frac{\langle \theta^{\text{out}} | \psi(0) | \theta^{\text{in}} \rangle}{\sqrt{\langle \theta^{\text{out}} | \theta^{\text{out}} \rangle \langle \theta^{\text{in}} | \theta^{\text{in}} \rangle}}$

# Statement of the Problem

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- We wish to compute  $\frac{\langle \boldsymbol{\theta}^{\text{out}} | \psi(0) | \boldsymbol{\theta}^{\text{in}} \rangle}{\sqrt{\langle \boldsymbol{\theta}^{\text{out}} | \boldsymbol{\theta}^{\text{out}} \rangle \langle \boldsymbol{\theta}^{\text{in}} | \boldsymbol{\theta}^{\text{in}} \rangle}}$
- but  $\langle \boldsymbol{\theta}^{\text{out}} | \psi(0) | \boldsymbol{\theta}^{\text{in}} \rangle = \sum_{q_2} \langle \boldsymbol{\theta}^{\text{out}} | \boldsymbol{\theta}^{\text{in}} \setminus \{ \theta_{q_2}^{\text{in}} \} \rangle \prod_{j \neq q_2} \frac{\theta_{q_2}^{\text{in}} - \theta_j^{\text{in}} + \imath c}{\theta_{q_2}^{\text{in}} - \theta_j^{\text{in}}}$  .

# Statement of the Problem

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- We wish to compute  $\frac{\langle \boldsymbol{\theta}^{\text{out}} | \psi(0) | \boldsymbol{\theta}^{\text{in}} \rangle}{\sqrt{\langle \boldsymbol{\theta}^{\text{out}} | \boldsymbol{\theta}^{\text{out}} \rangle \langle \boldsymbol{\theta}^{\text{in}} | \boldsymbol{\theta}^{\text{in}} \rangle}}$
- but  $\langle \boldsymbol{\theta}^{\text{out}} | \psi(0) | \boldsymbol{\theta}^{\text{in}} \rangle = \sum_{q_2} \langle \boldsymbol{\theta}^{\text{out}} | \boldsymbol{\theta}^{\text{in}} \setminus \{ \theta_{q_2}^{\text{in}} \} \rangle \prod_{j \neq q_2} \frac{\theta_{q_2}^{\text{in}} - \theta_j^{\text{in}} + \imath c}{\theta_{q_2}^{\text{in}} - \theta_j^{\text{in}}}$ .
- Each overlap may be written as a determinant related to the Slavnov determinant,

# Statement of the Problem

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- We wish to compute  $\frac{\langle \boldsymbol{\theta}^{\text{out}} | \psi(0) | \boldsymbol{\theta}^{\text{in}} \rangle}{\sqrt{\langle \boldsymbol{\theta}^{\text{out}} | \boldsymbol{\theta}^{\text{out}} \rangle \langle \boldsymbol{\theta}^{\text{in}} | \boldsymbol{\theta}^{\text{in}} \rangle}}$
- but  $\langle \boldsymbol{\theta}^{\text{out}} | \psi(0) | \boldsymbol{\theta}^{\text{in}} \rangle = \sum_{q_2} \langle \boldsymbol{\theta}^{\text{out}} | \boldsymbol{\theta}^{\text{in}} \setminus \{ \theta_{q_2}^{\text{in}} \} \rangle \prod_{j \neq q_2} \frac{\theta_{q_2}^{\text{in}} - \theta_j^{\text{in}} + \imath c}{\theta_{q_2}^{\text{in}} - \theta_j^{\text{in}}}$ .

- Each overlap may be written as a determinant related to the Slavnov determinant,
- namely the Matsuo-Kostov determinant:

$$\langle \tilde{\boldsymbol{\theta}} | \boldsymbol{\theta} \rangle = e^{\frac{\imath L}{2} \sum_j \theta_j - \tilde{\theta}_j} \det(\mathbb{1} - K), \quad K_{ij} = \frac{E_i}{u_i - u_j + \imath c}$$

$$E_i \equiv e^{-\imath L u_i} \frac{\prod_k (u_i - u_k + \imath c)}{\prod_{k \neq i} (u_i - u_k)}, \quad \mathbf{u} \equiv \boldsymbol{\theta} \cup \tilde{\boldsymbol{\theta}}$$

Comparison to Semiclassics

Summary

- $$K_{ij} = e^{-\imath Lu_i} \frac{Q_{\mathbf{u}}(u_i + \imath c)}{Q'_{\mathbf{u}}(u_i)} \frac{1}{u_i - u_j + \imath c}$$
- $$\vec{\psi} \rightarrow \psi(x) = \sum \frac{\psi_j}{x - u_j}, \quad K\vec{\psi} \rightarrow \mathcal{K}\psi = \sum \frac{(K\vec{\psi})_j}{x - u_j}$$

# The Operator $K$

Problem

The Functional Approach

-The Operator  $K$

-Trace

Saddle Point

Comparison to Semiclassics

Summary

- $$K_{ij} = e^{-\imath Lu_i} \frac{Q_{\mathbf{u}}(u_i + \imath c)}{Q'_{\mathbf{u}}(u_i)} \frac{1}{u_i - u_j + \imath c}$$
- $$\vec{\psi} \rightarrow \psi(x) = \sum \frac{\psi_j}{x - u_j}, \quad K \vec{\psi} \rightarrow \mathcal{K} \psi = \sum \frac{(K \vec{\psi})_j}{x - u_j}$$
- Then 
$$\sum_j \frac{\psi_j}{u_i - u_j + \imath c} = \psi(u_i + \imath c).$$

# The Operator $\mathcal{K}$

Problem

The Functional Approach

-The Operator  $\mathcal{K}$

-Trace

Saddle Point

Comparison to Semiclassics

Summary

- $$K_{ij} = e^{-\iota L u_i} \frac{Q_{\mathbf{u}}(u_i + \iota c)}{Q'_{\mathbf{u}}(u_i)} \frac{1}{u_i - u_j + \iota c}$$
- $$\vec{\psi} \rightarrow \psi(x) = \sum \frac{\psi_j}{x - u_j}, \quad K \vec{\psi} \rightarrow \mathcal{K} \psi = \sum \frac{(K \vec{\psi})_j}{x - u_j}$$
- Then 
$$\sum_j \frac{\psi_j}{u_i - u_j + \iota c} = \psi(u_i + \iota c).$$
- $$e^{-\iota L x} \frac{Q_{\mathbf{u}}(x + \iota c)}{Q_{\mathbf{u}}(x)} \psi(x + \iota c)$$
 is a candidate for  $\mathcal{K} \psi$ .

# The Operator K

Problem

The Functional Approach

-The Operator K

-Trace

Saddle Point

Comparison to Semiclassics

Summary

- $K_{ij} = e^{-\imath Lu_i} \frac{Q_u(u_i + \imath c)}{Q'_u(u_i)} \frac{1}{u_i - u_j + \imath c}$
- $\vec{\psi} \rightarrow \psi(x) = \sum \frac{\psi_j}{x - u_j}, \quad K\vec{\psi} \rightarrow \mathcal{K}\psi = \sum \frac{(K\vec{\psi})_j}{x - u_j}$
- Then  $\sum_j \frac{\psi_j}{u_i - u_j + \imath c} = \psi(u_i + \imath c)$ .
- $e^{-\imath Lx} \frac{Q_u(x + \imath c)}{Q_u(x)} \psi(x + \imath c)$  is a candidate for  $\mathcal{K}\psi$ .
- More precisely:

$$(\mathcal{K}\psi)(y) = \oint_u \frac{e^{-\imath Lx} Q_u(x + \imath c)}{y - x Q_u(x)} \psi(x + \imath c)$$

# The Operator $\mathcal{K}$

Problem

The Functional Approach

-The Operator  $\mathcal{K}$

-Trace

Saddle Point

Comparison to Semiclassics

Summary

$$(\mathcal{K}\psi)(y) = \oint_u \frac{e^{-\imath Lx} Q_u(x + \imath c)}{y - x} \frac{Q_u(x + \imath c)}{Q_u(x)} \psi(x + \imath c)$$

The Kostov-Matsuo operator is just  $1 + \mathcal{K}$  with:

$$\mathcal{K} = \mathcal{P}e^{\Phi} e^{\imath c \partial}$$

with

$$e^{\Phi(x)} = e^{-\imath Lx} \frac{Q_u(x + \imath c)}{Q_u(x)}, \quad (\mathcal{P}f)(x) = \oint \frac{f(y)}{x - y}$$

# Taking the Trace of the Resolvent

Problem

The Functional Approach

-The Operator  $K$

-Trace

Saddle Point

Comparison to Semiclassics

Summary

Take:

$$R_y(\lambda, u_j) \equiv [(1 - e^{-Ny} K)^{-1} e^{(j)}](\lambda).$$

# Taking the Trace of the Resolvent

Problem

The Functional Approach

-The Operator  $K$

-Trace

Saddle Point

Comparison to Semiclassics

Summary

Take:

$$R_y(\lambda, u_j) \equiv [(1 - e^{-Ny} K)^{-1} e^{(j)}](\lambda).$$

The trace is given by:

$$\begin{aligned} \text{tr}(\mathbb{1} - e^{-Ny} K)^{-1} &= \sum_j \text{Res}_{\lambda \rightarrow u_j} (R_y(\lambda, u_j)) = \\ &= \oint \oint \frac{R_y(\lambda, w)}{\lambda - w} \frac{dz}{2\pi i} \frac{dw}{2\pi i}, \end{aligned}$$

where the  $w$  integral surrounds the  $\lambda$  integral.

Comparison to Semiclassics

Summary

- To invert the matrix  $\mathbb{1} - e^{-Ny} K$ , solve:

$$R_y(z, w) = \oint \frac{e^{N(\Phi(z')-y)} R_y(z' + \imath c, w)}{z - z'} = \frac{1}{z - w}$$

with  ~~$w \in \mathbf{u}$~~  and  $e^{N\Phi(x)} = e^{-\imath Lx} \frac{Q_{\mathbf{u}}(x+\imath c)}{Q_{\mathbf{u}}(x)}$

- Previously we considered  $c \sim \frac{1}{N}$ . Another limit,  $c \sim N$ , is interesting. Now interested in  $c \sim 1$ .

# Fourier Transformed Integral Equation

Problem

The Functional Approach

Saddle Point

-Fourier Transform

-Ansatz

-Substitution

Comparison to Semiclassics

Summary

The integral equation can be solved in the large  $N$  by first applying a Fourier transform.

$$\frac{1}{z - w} =$$

$$R_y(z, w) = \oint \frac{e^{\Phi(z') - Ny} R_y(z' + \imath c, w)}{z - z'}$$

$$\oint e^{-N\imath Pz} R_y(z, w) = e^{NS(P, w)}$$

$$\oint e^{N(\Phi(z) - \imath Pz)} = e^{N\tilde{\varphi}(P)}$$

# Fourier Transformed Integral Equation

Problem

The Functional Approach

Saddle Point

-Fourier Transform

-Ansatz

-Substitution

Comparison to Semiclassics

Summary

The integral equation can be solved in the large  $N$  by first applying a Fourier transform.

$$\frac{1}{z - w} = R_y(z, w) - \oint \frac{e^{\Phi(z') - Ny} R_y(z' + \imath c, w)}{z - z'}$$

For  $P > 0$  this becomes ( $e^{N\Phi(z)} \rightarrow e^{\imath N\tilde{\varphi}(P)}$ ) :

$$e^{-\imath NPw} = e^{\imath NS(P, w)} - \int_0^\infty e^{\imath N[S(Q, w) + \imath cQ + \tilde{\varphi}(P - Q)]} dQ$$

# Ansatz for Solving the Integral Equation

Problem

The Functional Approach

Saddle Point

-Fourier Transform

-Ansatz

-Substitution

Comparison to Semiclassics

Summary

$$e^{-iNPw} = e^{iNS(P,w)} - \int_0^\infty e^{iN[S(Q,w) + icQ + \tilde{\varphi}(P-Q)]} dQ$$

Only one term on the right hand side dominates.

# Ansatz for Solving the Integral Equation

Problem

The Functional Approach

Saddle Point

-Fourier Transform

-Ansatz

-Substitution

Comparison to Semiclassics

Summary

$$e^{-iNPw} = e^{iNS(P,w)} - \int_0^\infty e^{iN[S(Q,w)+icQ+\tilde{\varphi}(P-Q)]} dQ$$

Only one term on the right hand side dominates.

$$e^{iNS(P,w)} = \begin{cases} -e^{-iN(\Phi(w)+(w+ic)P)} & P < -\frac{1}{c}\text{Im}(\Phi(w)) \\ e^{-iNPw} & -\frac{1}{c}\text{Im}(\Phi(w)) < P \end{cases}$$

# Substituting the Ansatz

Problem

---

The Functional Approach

Comparison to Semiclassics

Summary

$$e^{-iNPw} \stackrel{?}{=} - \int_0^{\infty} e^{iN[S(Q,w)+icQ+\tilde{\varphi}(P-Q)]} dQ$$

with  $e^{iNS(P,w)} = -e^{-iN(\Phi(w)+(w+ic)P)}$ .

Substitute:

$$e^{-iNPw} \stackrel{?}{=} e^{-iN\Phi(w)-iNPw} \int_0^{\infty} e^{iN[w(P-Q)+\tilde{\varphi}(P-Q)]} dQ$$

# Substituting the Ansatz

Problem

The Functional Approach

Saddle Point

-Fourier Transform

-Ansatz

-Substitution

Comparison to Semiclassics

Summary

$$e^{-iNPw} \stackrel{?}{=} - \int_0^{\infty} e^{iN[S(Q,w)+icQ+\tilde{\varphi}(P-Q)]} dQ$$

with  $e^{iNS(P,w)} = -e^{-iN(\Phi(w)+(w+ic)P)}$ .

Substitute:

$$e^{-iNPw} \stackrel{!}{=} e^{-iN\Phi(w)-iNPw} \underbrace{\int_0^{\infty} e^{iN[w(P-Q)+\tilde{\varphi}(P-Q)]} dQ}_{e^{iN\Phi(w)}}$$

# Substituting the Ansatz

Problem

The Functional Approach

Saddle Point

-Fourier Transform

-Ansatz

-Substitution

Comparison to Semiclassics

Summary

$$e^{-iNPw} \stackrel{?}{=} - \int_0^{\infty} e^{iN[S(Q,w)+icQ+\tilde{\varphi}(P-Q)]} dQ$$

with  $e^{iNS(P,w)} = -e^{-iN(\Phi(w)+(w+ic)P)}$ .

Substitute:

$$e^{-iNPw} \stackrel{!}{=} e^{-iN\Phi(w)-iNPw} \underbrace{\int_0^{\infty} e^{iN[w(P-Q)+\tilde{\varphi}(P-Q)]} dQ}_{e^{iN\Phi(w)}}$$

Which is valid due to a saddle point justification.

- We get:

$$\langle \text{out} | \psi(0) | \text{in} \rangle = C \oint e^{\frac{4\eta u_a}{\pi} u(z)} \frac{\sigma(u(z) - u_a)}{\sigma(u(z) + u_a)} dz$$

-Comparison

Summary

- Classical average over space-time (Flaschka, McLaughlin, Forest):

$$\langle \psi(x) \rangle = \oint e^{\frac{4\eta u_a}{\pi} u(z)} \frac{\sigma(u(z) - u_\infty)}{\sigma(u(z) + u_\infty)} \frac{dz}{\sqrt{\prod (z - \lambda_i)}}$$

- We get:

$$\langle \text{out} | \psi(0) | \text{in} \rangle = C \oint e^{\frac{4\eta u_a}{\pi} u(z)} \frac{\sigma(u(z) - u_a)}{\sigma(u(z) + u_a)} dz$$

- The measure of integration is different but the object integrated over is the same

Problem

The Functional  
Approach

Saddle Point

Comparison to  
Semiclassics

Summary

- We compute the matrix elements of the field operator of the Lieb-Liniger model in the intermediate  $c$  regime.

# Summary

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- We compute the matrix elements of the field operator of the Lieb-Liniger model in the intermediate  $c$  regime.
- We approach the semiclassical limit (but do not actually take it).

# Summary

Problem

The Functional Approach

Saddle Point

Comparison to Semiclassics

Summary

- We compute the matrix elements of the field operator of the Lieb-Liniger model in the intermediate  $c$  regime.
- We approach the semiclassical limit (but do not actually take it).
- The comparison is suggestive that the approach is correct.
