Neutrino energy spectrum

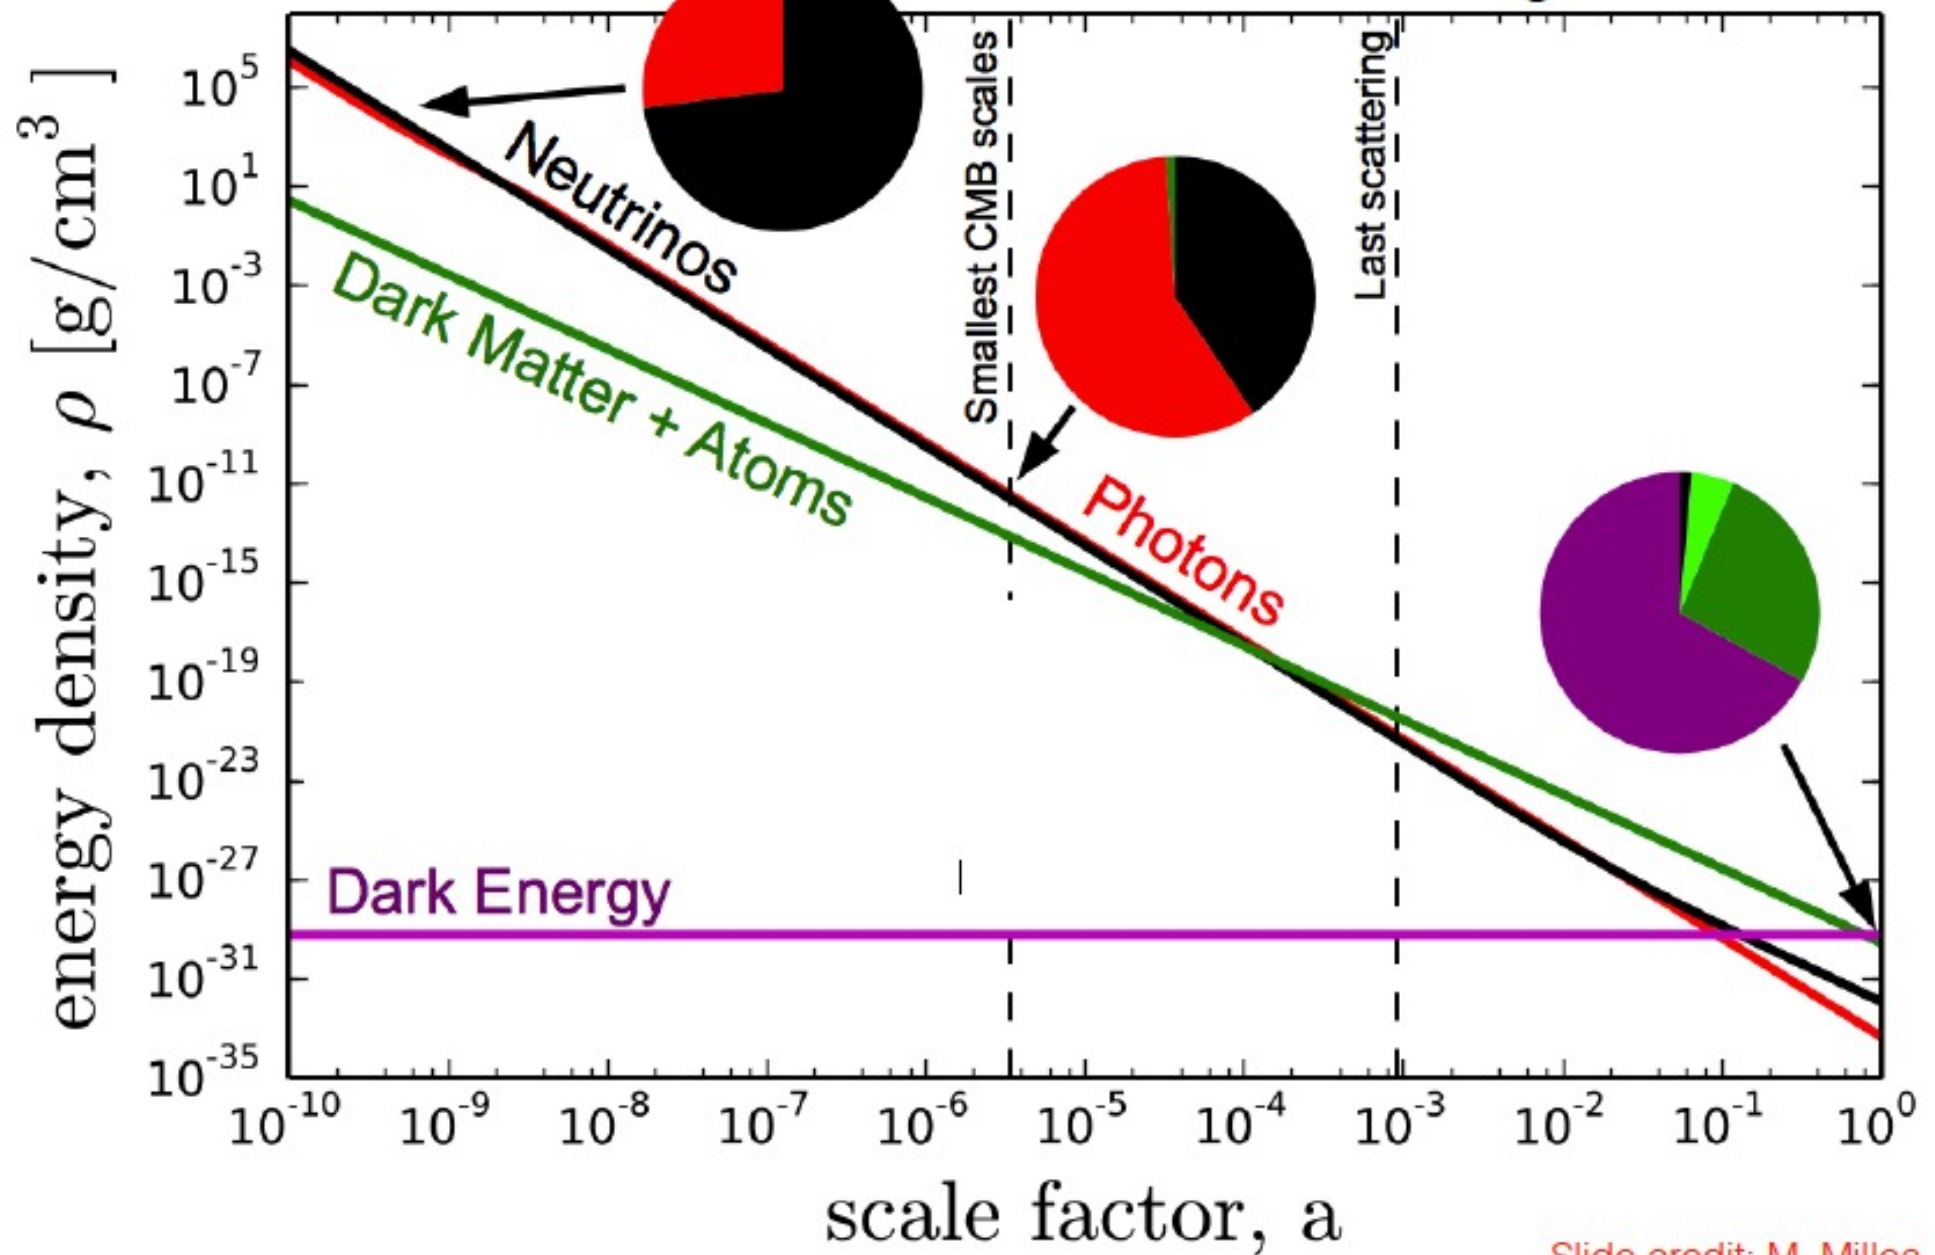

Cosmology with neutrinos

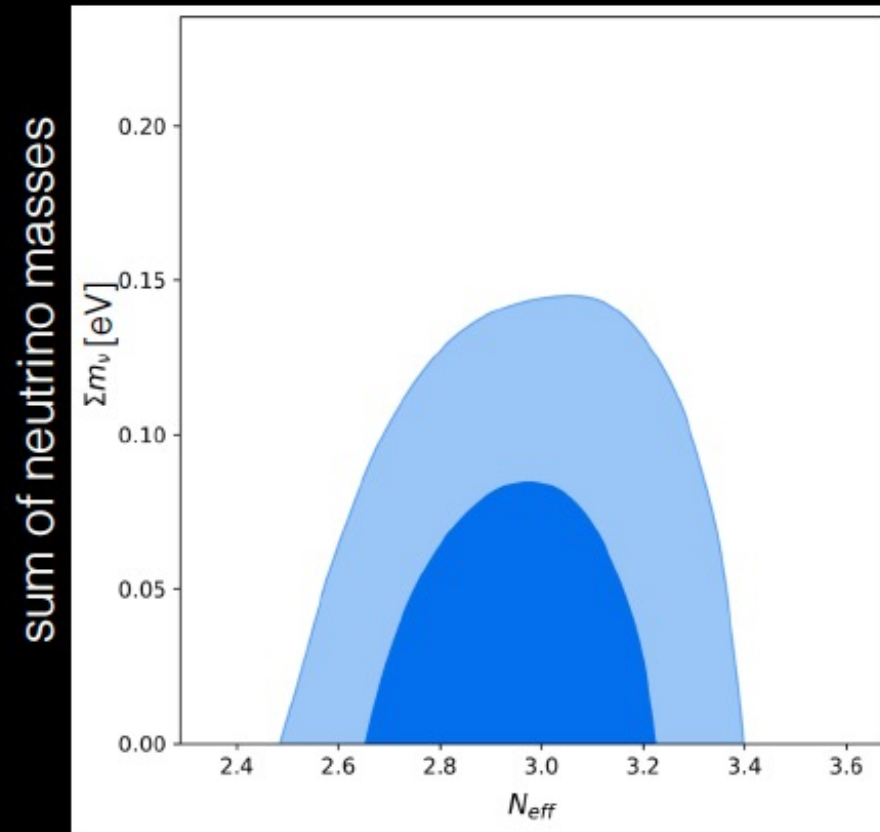

- Second most abundant particle in the universe
- Freeze out during primordial nucleosynthesis about 3min after Big Bang
- Former candidate for hot dark matter

Weak interactions were fast | e-/e+ annihilation | Evolution of all significant components in the standard cosmological model

Total neutrino mass and number of flavours

Current Status: CMB+BAO

highest energy “radiation” from the Universe: neutrinos and cosmic rays

Credit : F. Halzen
Nu 2020

Universe is opaque above ~ 100 TeV energy

The opaque Universe

PeV photons interact with microwave photons
($411/\text{cm}^3$) before reaching our telescopes

enter: neutrinos

Neutrinos? Perfect Messenger

- electrically neutral
- essentially massless
- essentially unabsorbed
- tracks nuclear processes
- reveal the sources of cosmic rays

- ... but difficult to detect

Credit : F. Halzen
Nu 2020

Spectrum of cosmic rays

Non-thermal Spectrum

Can be explained by → shock wave acceleration

Direct discovery of CR sources not yet successful

Much higher energies than at LHC can be reached

Shock wave acceleration

Ball picks up energy from moving walls at each rebound

Ball → electrons, protons

Wall1: e.g. Supernova remnant

Wall2: surrounding material

Elastic reflection: magnetic fields

Supernova-Remnants: shock waves with interstellar medium

Up to 10^{16} eV

Neutrinos properties

Neutrino Oscillations

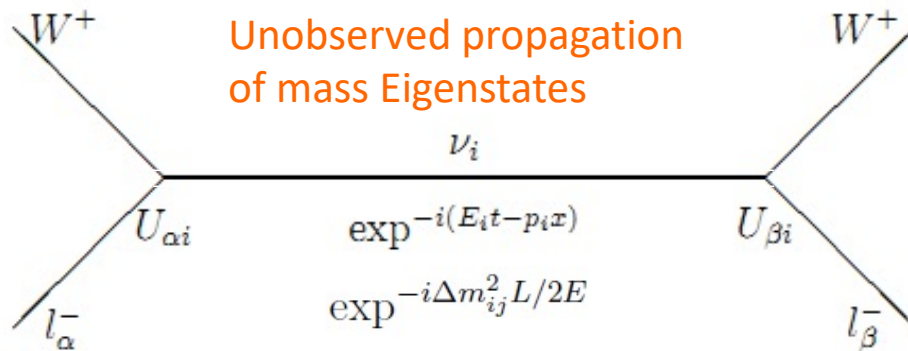

- Weak Eigenstates are superposition of mass Eigenstates

$$\nu_\alpha = \sum_i U_{\alpha i} \nu_i$$

Neutrino production
via CC interaction

Neutrino detection
via CC interaction

Equivalence to double
slit experience

Neutrino flavour defined via charged leptons

Coherent sum

$$P(\alpha \rightarrow \beta) = \left| \sum_i U_{\beta i} \exp^{-i(E_i t - \vec{p}_i \vec{x})} U_{\alpha i}^* \right|^2.$$

Classic: incoherent sum

$$P(\alpha \rightarrow \beta) = \sum_i |U_{\alpha i}|^2 |U_{\beta i}|^2$$

Table of elementary particle

Neutrino Masses

- Much smaller than other fermion masses
- Do neutrinos follow the mass/family rule?

Neutrino masses

- Different mass combinations are measured
- Cosmology : $\sum m_i$
- Oscillations : $m_i^2 - m_j^2$
- beta decay $m_{\nu_e} = \sqrt{\sum_i |U_{ei}|^2 m_{\nu_i}^2}$
- Double beta decay $\langle m_{\beta\beta} \rangle = \left| \sum_i |U_{ei}|^2 m_{\nu_i} e^{i\alpha_i} \right|$

Neutrino mixing and oscillations

Pontecorvo – Maki – Nakagawa - Sakata (PMNS) matrix

$$\text{weak eigenstates} \begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu1} & U_{\mu2} & U_{\mu3} \\ U_{\tau1} & U_{\tau2} & U_{\tau3} \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix} \text{mass eigenstates}$$

3 mixing angles + 1 phase

$$(c_{ij} \equiv \cos \theta_{ij}, \quad s_{ij} \equiv \sin \theta_{ij})$$

$$U = \begin{pmatrix} c_{12} & s_{12} & & \\ -s_{12} & c_{12} & & \\ & & c_{13} & s_{13} \cdot e^{i\delta} \\ & & -s_{13} \cdot e^{i\delta} & c_{13} \end{pmatrix} \begin{pmatrix} 1 & & & \\ & c_{23} & s_{23} & \\ & -s_{23} & c_{23} & \\ & & & 1 \end{pmatrix} \begin{pmatrix} 1 & & & \\ & e^{i\alpha} & & \\ & & e^{i\beta} & \\ & & & 1 \end{pmatrix}$$

The “atmospheric” oscillation parameters

- Situation after “:Neutrino 2020”

Neutrino oscillations in matter

Propagation of electron (anti-)neutrinos in the Earth affected by matter potential (Mikheyev-Smirnov-Wolfenstein effect)

Forward scattering on electrons

⇒ change of effective mass for the electron neutrinos

⇒ change of oscillation pattern

⇒ Sensitive to Neutrino Mass hierarchy

Resonance Effect in Matter

- ν_e see additional potential due to W-exchange in $\nu + e \rightarrow \nu + e$ scattering
- Illustration for constant electron density n_e
- At resonant energy θ_{13} maximal
 changes sign with n_e via $\nu / \bar{\nu}$
 changes sign with $\Delta m^2 \rightarrow$ **mass hierarchy** !

$$\begin{aligned} \sin 2\theta_{13}^m &= \sin(2\theta_{13})/R & ; & & (\Delta m_{31}^2)^m &= \Delta m_{32}^2/2[1 + A + R] \\ \theta_{23}^m &= \theta_{23} & ; & & (\Delta m_{32}^2)^m &= \Delta m_{32}^2 R \\ \theta_{12}^m &= \pi/2 & ; & & (\Delta m_{21}^2)^m &= \Delta m_{32}^2/2[1 + A - R] \end{aligned}$$

$$\begin{aligned} R &= \sqrt{(A - \cos 2\theta_{13})^2 + (\sin 2\theta_{13})^2} \\ A &= 2\sqrt{2}G_F n_e E / \Delta m_{32}^2. \end{aligned}$$

Possible mass pattern

- Naming/Color convention
 - Index 1, 2, 3 : increasing contribution of electron state
 - Electron Muon Tau
- Matter effect in sun fixes $m_2 > m_1$
- No matter effects to measure $\Delta m_{31}^2 \rightarrow$ sign unconstrained
- 2 schemes survive

Dirac versus Majorana

- **Neutrinoless double beta decay**
- Only known method to test Majorana nature of neutrinos
- Internal neutrino must flip helicity, suppressed with $(m/Q)^2$
- Neutrino – Antineutrino oscillations suppressed with $(m/E)^2 \sim 10^{-12}$ hopeless
- Side effect of Majorana mass term : Dirac field splits into two Majorana fields \rightarrow automatically introduces **sterile ν 's** (eV – LSND, keV – warm dark matter, 10^{15} eV – Seesaw)

Double beta decay experiments

Current Limits and Future Goals

- Present best limits:

- ^{136}Xe (KamLAND-Zen): $T_{1/2} > 10^{26}$ yrs
- ^{76}Ge (GERDA): $T_{1/2} > 10^{26}$ yrs
- ^{130}Te (CUORE): $T_{1/2} > 3 \times 10^{25}$ yrs

- Future goal:

~2 OoM improvement in $T_{1/2}$

- Covers IO
- Up to 50% of NO
- Factor of ~few in Λ
- An aggressive experimental goal

$$\frac{1}{T_{1/2}} = G_{01} g_A^4 \left(M^{0\nu} + \frac{g_\nu^{\text{NN}} m_\pi^2}{g_A^2} M_{\text{cont}}^{0\nu} \right)^2 \frac{m_{\beta\beta}^2}{m_e^2}$$
