Enriching the Maths/Physics Dialogue

- Alg./diff. Geometry/topology - Rep. Theo : the right language for physics
 - Gravity \sim Ricci 2-form of Tangent bundles;
 - Elementary Particles \sim irred reps of the Lorentz group and sections of bundles with Lie structure group; Interactions \sim Tensor products of sections . . .
 - **String theory: brain-child of gauge-gravity geometrization tradition**
- **A new exciting era** for synergy with (pure & computational) geometry, group theory, combinatorics, number theory: *Sage*, *M2*, *GAP*, *LMFDB*, *GrDB* are becoming indispensable tools for physicists
- **Interdisciplinary enterprise**: cross-fertilisation of particle/string theory, phenomenology, pure mathematics, computer algorithms, data-bases, . . .

Vacuum Degeneracy

Perhaps the biggest theoretical challenge to string theory:

selection criterion??? metric on the landscape???

- Douglas (2003): Statistics of String vacua
- Kachru-Kalosh-Linde-Trivedi (2003): type II/CY estimates of 10^{500}
- Taylor-YN Wang (2015-7): F-theory estimates 10^{3000} to 10^{10^5}
- Basic Reason:

Algebraic Geometry \rightsquigarrow Combinatorial Geometry \rightsquigarrow Exponential Growth in dim

The most famous Calabi-Yau dataset

Searching the Standard Model

SM places some constraints but still not enough:

- Braun-YHH-Ovrut; Bouchard-Cvetic-Donagi (2005): exact MSSM particles
- Gmeiner-Blumenhagen-Honecker-Lüst-Weigand (2005): 1 in 10^9 in D-brane MSSM modles
- Candelas-de la Ossa-YHH-Szendroi (2007): **Triadophilia** \Rightarrow “des res”?
- Anderson-Gray-Lukas-Palti (2012-3): Het line bundle MSSM: 200 in 10^{10}

Recent estimates

- Constatin-YHH-Lukas; Deen-YHH-SJ Lee-Lukas (2018-9) MSSM from heterotic line bundles: 10^{23} from CICYs; 10^{723} from KS
- Cvetic-Halverson-Lin-Liu-Tian (2019): 10^{15} F-theory MSSMs

The Geometric Origin of our Universe

- Each geometry X gives a 4-D universe
 - The geometry of X determines the physics of the 4-D world
 - particles and interactions \sim cohomology theory; masses \sim metric; Yukawa \sim Triple intersections/integral of forms over X

Ubi materia, ibi geometria

– Johannes Kepler (1571-1630)

- Our Universe: $\left\{ \begin{array}{l} (1) \text{ probabilistic/anthropic?} \\ (2) \text{ Sui generis/selection rule?} \\ (3) \text{ one of multi-verse ?} \end{array} \right.$
cf. *Exo-planet/Habitable Zone search*

Recasting Geometry

- A typical calculation:

$$X = \begin{pmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix} \longrightarrow \text{What Bourbaki teaches us} \longrightarrow h^{2,1}(X) = 22$$

- Key to computational Algebraic Geometry: [Gröbner basis](#), double-exponential complexity (unlike Gaussian elimination which is generalizes)
- [\[YHH 1706.02714\]](#) Deep-Learning the Landscape, *PLB* 774, 2017; (cf. Feature in *Science*, Aug, vol 365 issue 6452, 2019): think of it as an image processing problem

$$\longrightarrow \text{What Machine-Learning teaches us} \longrightarrow 22$$

A Wild Question: “deep-learn the landscape?”

- Typical Problem in String Theory/Algebraic Geometry:

- Experimentally, it seems so for many situations in geometry and beyond.

- Initially tried a shallow MLP on CICY dataset
- improved over the years: Bull-YHH-Mishra-Jejjala, Krippendorf-Syvaeri, Erban-Finotello, Lukas, Constantin, Schneider, Larfors, ... > 99.96% accuracy

2017: String Theory enters the Machine-Learning Era

YHH (1706.02714);

q.v. Krefl-Seong (1706.03346); Ruehle (1706.07024);

Carifio-Halverson-Krioukov-Nelson (1707.00655)

Of course, we are 30 years behind experimentalists!

CERN: 1990, first ML + HEP seminar series \sim same time as first CY data!

Sophia: Hanson Robotics
HongKong

- Beginning of **String_Data**
- How can ML and modern data-science help with the vacuum degeneracy problem??
- Meanwhile ... Sophia becomes a “human” citizen (in Saudi Arabia)

Clearly useful for maths and physics

- **Conjecture Formulation** e.g.,
 - '19 YHH-Kim: separating hyperplane - simple/non-simple groups; open
 - '19 Brodie-Constantin-Lukas: exact formulae for cohomology surf.; proved.
 - '20 YHH-Lee-Oliver: L-coefficients and integer part./torsion on elliptic; proved.
 - '20 Craven-Jejjala-Par: Jones polynomial best-fit function; open
 - '22 DeepMind Collaboration bounds on volume conjecture for knots
 - ...
- **Speed up & Improve Accuracies** e.g.,
 - computing/estimating (topological invariants, charges, etc) MUCH FASTER
 - '19 Ashmore-YHH-Ovrut: speed up Donaldson algorithm@CY metric 10-100
 - '20 Douglas et al., Anderson et al. accuracy improvement on Donaldson 10-100 times
 - ...

An Inherent Hierarchy?

- ML the structure of mathematics: [YHH 2101.06317](#)
- In decreasing precision/increasing difficulty:

numerical
string theory \rightarrow algebraic geometry over $\mathbb{C} \sim$ arithmetic geometry
algebra
string theory \rightarrow combinatorics
analytic number theory

A toast to Prof. Ignatios
Antoniadis

- Reflexive Polyhedra \rightsquigarrow CY: anticanonical hypersurface in toric variety from Δ
- Dim 2: **16** up to $SL(2; \mathbb{Z})$ (Italian School 1890s)
- Dim 3: **4139** up to $SL(3; \mathbb{Z})$ (KS, 1999)
- Dim 4: **473800776** up to $SL(4; \mathbb{Z})$ (KS, 2000)
- Dim > 4 : **Open ??**

Altman-Carifio-Halverson-Nelson (2018): estimated 10^{10^4} triangulations

Altman-Gray-YHH-Jejjala-Nelson (2014): brute-force: $\sim 10^6$ up to $h^{1,1} = 6$

The Proper Way $\mathcal{O}(e^{e^d})$

- Recall Hodge decomposition $H^{p,q}(X) \simeq H^q(X, \wedge^p T^*X) \rightsquigarrow$

$$H^{1,1}(X) = H^1(X, T_X^*), \quad H^{2,1}(X) \simeq H^{1,2} = H^2(X, T_X^*) \simeq H^1(X, T_X)$$

- Euler Sequence** for subvariety $X \subset A$ is short exact:

$$0 \rightarrow T_X \rightarrow T_M|_X \rightarrow N_X \rightarrow 0$$

- Induces **long exact sequence in cohomology**:

$$\begin{array}{ccccccc} 0 & \rightarrow & \overset{0}{\cancel{H^0(X, T_X)}} & \rightarrow & H^0(X, T_A|_X) & \rightarrow & H^0(X, N_X) \rightarrow \\ & & \boxed{H^1(X, T_X)} & \xrightarrow{d} & H^1(X, T_A|_X) & \rightarrow & H^1(X, N_X) \rightarrow \\ & & H^2(X, T_X) & \rightarrow & \dots & & \end{array}$$

- Need to compute $\text{Rk}(d)$, cohomology and $H^i(X, T_A|_X)$ (Cf. Hübsch)

The Neural Network Approach

- Bijection from  to $\{1, 2, \dots, 9, 0\}$?
- Take large sample, take a few hundred thousand (e.g. NIST database)

6 → 6, 8 → 8, 2 → 2, 4 → 4, 8 → 8, 7 → 7, 8 → 8,
0 → 0, 4 → 4, 2 → 2, 5 → 5, 6 → 6, 3 → 3, 2 → 2,
9 → 9, 0 → 0, 3 → 3, 8 → 8, 8 → 8, 1 → 1, 0 → 0,

- Data = Training Data \sqcup Validation Data
Test trained NN on validations data to see accuracy performance

Universal Approximation Theorems

Large Depth Thm: (Cybenko-Hornik) For every continuous function $f : \mathbb{R}^d \rightarrow \mathbb{R}^D$, every compact subset $K \subset \mathbb{R}^d$, and every $\epsilon > 0$, there exists a continuous function $f_\epsilon : \mathbb{R}^d \rightarrow \mathbb{R}^D$ such that $f_\epsilon = W_2(\sigma(W_1))$, where σ is a fixed continuous function, $W_{1,2}$ affine transformations and composition appropriately defined, so that $\sup_{x \in K} |f(x) - f_\epsilon(x)| < \epsilon$.

Large Width Thm: (Kidger-Lyons) Consider a feed-forward NN with n input neurons, m output neuron and an arbitrary number of hidden layers each with $n + m + 2$ neurons, such that every hidden neuron has activation function φ and every output neuron has activation function the identity. Then, given any vector-valued function f from a compact subset $K \subset \mathbb{R}^m$, and any $\epsilon > 0$, one can find an F , a NN of the above type, so that $|F(x) - f(x)| < \epsilon$ for all $x \in K$.

ReLU Thm: (Hanin) For any Lebesgue-integral function $f : \mathbb{R}^n \rightarrow \mathbb{R}$ and any $\epsilon > 0$, there exists a fully connected ReLU NN F with width of all layers less than $n + 4$ such that $\int_{\mathbb{R}^n} |f(x) - F(x)| dx < \epsilon$.
