

Discrete R-symmetry, Various Energy Scales and Gravitational Waves

lundi 30 mai 2022 15:20 (20 minutes)

We present a supersymmetric model where energy scales of a discrete R-symmetry breaking (Z₆R) and cosmic inflation are commonly attributed to the confinement scale of a hidden Sp(2) strong dynamics. Apart from these, SUSY-breaking scale, the Higgsino mass and the right-handed neutrino masses are all shown to stem from Z₆R breaking scale inferred from CMB observables. We will show that the model is characterized by the SUSY-breaking so mass $m \sim 100\text{-}1000\text{TeV}$ and the reheating temperature $T \sim 10^9\text{GeV}$. en we discuss how these predictions of the model can be tested with the help of the spectrum of the gravitational wave induced by the short-lived cosmic string present during the reheating era.

Orateur: CHOI, gongjun (CERN)

Classification de Session: Parallel session 2
