

# Natural Feeble Interactions via Fuzzy Branes

Florian NORTIER

CEA Paris-Saclay, IPhT, Orme des Merisiers, Gif-sur-Yvette, France

November 15, 2021

Different motivations to have **suppressed interaction couplings** in BSM physics:

- hierarchy of Yukawa couplings in flavor physics,
- origin of neutrino masses,
- dark matter particles (WIMP's, FIMP's, ...),
- axions,
- gravity,
- ...

If small coupling **technically natural** ('t Hooft naturalness): Still interesting to have a **fundamental origin** for a small parameter (Dirac naturalness).

**Talk:** New way to generate suppressed couplings via an **extra dimension of space & branes** in the framework of **UV nonlocal QFT**.

- 1 Why UV Nonlocality?
  - Quantum Spacetime  $\Rightarrow$  UV Nonlocality
  - String-Inspired Toy Model of Fuzzy Particles
  
- 2 Split Fermions in an Extra Dimension of Space
  - Extra Dimensions of Space & Branes
  - Split Fermions in a Domain Wall (AS Model)
  - Split Fermions via Fuzzy Branes

## 1 Why UV Nonlocality?

- Quantum Spacetime  $\Rightarrow$  UV Nonlocality
- String-Inspired Toy Model of Fuzzy Particles

## 2 Split Fermions in an Extra Dimension of Space

- Extra Dimensions of Space & Branes
- Split Fermions in a Domain Wall (AS Model)
- Split Fermions via Fuzzy Branes

# Quantum Spacetime $\Rightarrow$ UV Nonlocality

- UV nonlocality  $\Rightarrow$  Better UV behavior than local QFT's (R. Feynman).
- Quantum gravity (string theory, loop quantum gravity (LQG), ...) & Quantum spacetime (LQG, noncommutative geometry, ...)  $\Rightarrow$  Minimal length scale in Nature  $\Rightarrow$  UV nonlocality.
- Strong indications that some UV nonlocal QFT of pure gravity are super-renormalizable or even finite on Minkowski spacetime (L. Modesto).
- In this talk: Prototypes of nonlocal QFT's inspired by string field theory (SFT).  $\Rightarrow$  No notion of microcausality! But macrocausality seems OK...

# String-Inspired Toy Model of Fuzzy Particles

L. Buoninfante, G. Lambiase, A. Mazumdar, Nucl. Phys. B 944 (2019) 114646

Real scalar  $\phi$  on a **4D Euclidean spacetime**  $\mathbb{R}^4$  of signature  $(++++)$ :

$$\mathcal{L} = -\frac{1}{2} \phi(x) (\square - m^2) \phi(x) + \frac{\lambda}{4!} [e^{f(\square)} \phi(x)]^4(x), \quad \square = \partial_\mu \partial_\mu.$$

Delocalized scalar field via a **smearing infinite derivative operator**:

$$\tilde{\phi}(x) = e^{f(\square)} \phi(x), \quad f(\square) = \frac{\square - m^2}{\Lambda^2}, \quad \text{nonlocal scale: } \Lambda = 1/\ell.$$

Nonlocality manifest by introducing the **smearing heat kernel**  $K(x - x')$ :

$$\tilde{\phi}(x) = \int d^4 x' K(x - x') \phi(x'), \quad K(x - x') = e^{f(\square)} \delta(x - x') \propto \exp \left[ - \left( \frac{|x - x'|}{2\ell} \right)^2 \right].$$

$\Rightarrow$  **SFT-like form factor**. Move nonlocality: *interaction*  $\rightarrow$  *kinetic* terms:

$$\mathcal{L} = -\frac{1}{2} \tilde{\phi}(x) e^{-2f(\square)} (\square - m^2) \tilde{\phi}(x) + \frac{\lambda}{4!} \tilde{\phi}^4(x) \quad \Rightarrow \quad \Pi(p^2) = \frac{-ie^{-2f(p^2)}}{p^2 + m^2}.$$

$\Rightarrow$  **No ghost at tree level!**

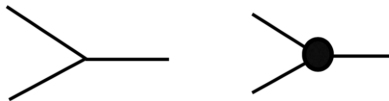

Figure: Local versus nonlocal vertex

## 1 Why UV Nonlocality?

- Quantum Spacetime  $\Rightarrow$  UV Nonlocality
- String-Inspired Toy Model of Fuzzy Particles

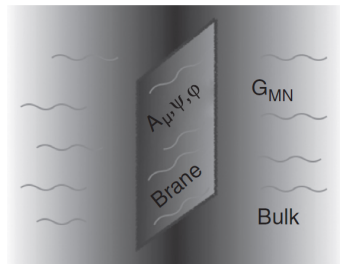

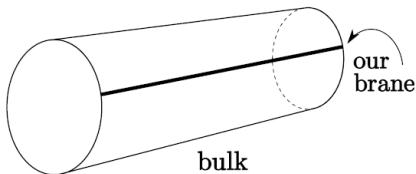

## 2 Split Fermions in an Extra Dimension of Space

- Extra Dimensions of Space & Branes
- Split Fermions in a Domain Wall (AS Model)
- Split Fermions via Fuzzy Branes

# Extra Dimensions of Space & Branes (1/2) – Bottom-Up Approach

Local EFT's with extra dimensions of space &  $\delta$ -like branes.

- $\delta$ -like brane = Hypersurface where fields and/or interactions can be localized.
- Bulk = Whole spacetime outside the branes.

5D action with multibranes:

$$S_{5D} = \int d^4x \, dy \left[ \mathcal{L}_{bulk} + \sum_{i=1}^N \delta(y - y_i) \mathcal{L}_{brane}^{(i)} \right].$$

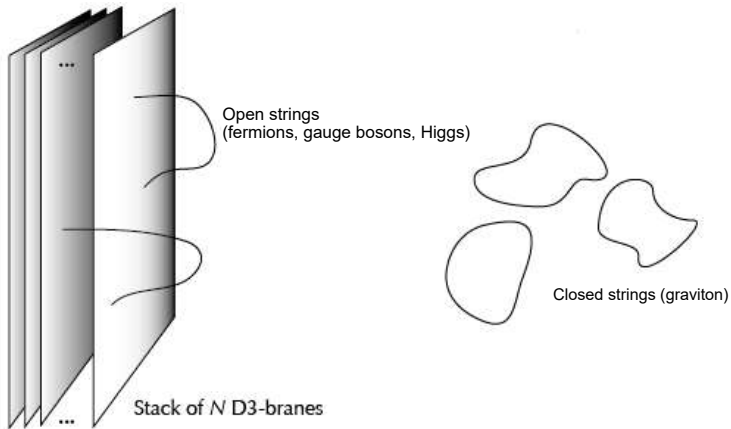

Kaluza-Klein (KK) dimensional reduction (5D  $\rightarrow$  4D).

$\Rightarrow$  4D KK-modes  $\phi_n$  & bulk wave functions  $f_n$ :

$$\Phi(x, y) = \sum_n^{\infty} f_n(y) \phi_n(x).$$

String theory (heterotic strings & superstrings):

- 6 extra dimensions of space, D-branes, O-planes, ...
- UV nonlocality.

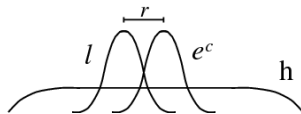

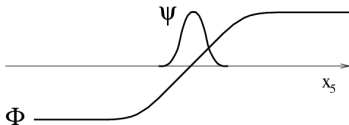

# Split Fermions in a Domain Wall (AS Model)

N. Arkani-Hamed, M. Schmaltz, Phys. Rev. D 61 (2000) 033005

## AS model:

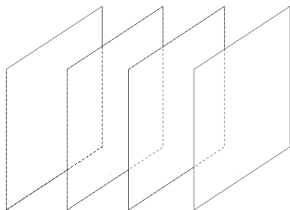

- Domain wall from a bulk scalar field  $\Phi$  in a flat extra dimension of space.
- Bulk Yukawa coupling  $\mathcal{O}(1)$  between  $\Phi$  & a bulk fermion field  $\Psi$ .  
⇒ 1 zero mode: 4D chiral fermion trapped in the domain wall with a Gaussian bulk wave function.
- 2 bulk fermions  $\Psi^{(1)}$  &  $\Psi^{(2)}$  with  $\neq$  bulk masses  $\mathcal{O}(1)$ .  
⇒ 4D chiral zero modes: left-handed  $\psi_L^{(1)}$  & right-handed  $\psi_R^{(2)}$ .  
⇒ Gaussian wave functions peaked at  $\neq$  positions along the extra dimension.
- Bulk Higgs field: 4D zero mode  $h$  with a flat bulk wave function.  
+ Bulk Yukawa couplings  $\mathcal{O}(1)$  to  $\Psi^{(1)}$  &  $\Psi^{(2)}$ .  
⇒ 4D Yukawa couplings between the zero modes  $h$ ,  $\psi_L^{(1)}$  &  $\psi_R^{(2)}$  naturally  $\ll 1$ .

# Split Fermions via Fuzzy Branes (1/3)

F. Nortier, Working paper, DOI: 10.5281/zenodo.4898023

**Goal:** Reproduce AS model of split fermions: **domain wall**  $\rightarrow$  **multiple fuzzy branes**.

**Model:**

- 5D **Euclidean spacetime**  $(+++++)$ .
- 1 flat **extra dimension** of space: **interval** of length  $\rho \Rightarrow M_{KK} = 1/\rho$  (KK-scale).
- 4D **Weyl fermions**  $\psi_L^{(1)}$  &  $\psi_R^{(2)}$  on 2 different  **$\delta$ -like branes** (away from the boundaries).
- 1 **bulk Higgs field**  $H$ .
- Only 2 nonlocal scales (to simplify):  $\Lambda_H = 1/\ell_H$  &  $\Lambda_\Psi = 1/\ell_\Psi$ .  
+ mild hierarchy:  $\Lambda_H \rightarrow \infty \gg \Lambda_\Psi \gg M_{KK}$ .  
 $\Rightarrow$  5D EFT: **local** bulk Higgs field ( $\ell_H \rightarrow 0$ ) + **delocalized** brane-fermions  $\psi_L^{(1)}$  &  $\psi_R^{(2)}$ .
- **Yukawa interaction** between  $H$ ,  $\psi_L^{(1)}$  &  $\psi_R^{(2)}$ .

# Split Fermions via Fuzzy Branes (2/3)

F. Nortier, Working paper, DOI: 10.5281/zenodo.4898023

Delocalized brane-fermion fields:

$$\begin{aligned}\Psi_{L/R}^{(1/2)}(x, y) &= e^{\square_5/\Lambda_\Psi^2} \psi_{L/R}^{(1/2)}(x) \delta(y - y_{1/2}), \quad \square_5 = \partial_\mu \partial_\mu + \partial_y^2, \\ &= e^{\square_4/\Lambda_\Psi^2} \psi_{L/R}^{(1/2)}(x) g(y - y_{1/2}), \quad \square_4 = \partial_\mu \partial_\mu.\end{aligned}$$

Transverse smearing function (Gaussian):

$$g(y - y_{1/2}) = \frac{1}{\sqrt{4\pi} \ell_\Psi} \exp \left[ - \left( \frac{y - y_{1/2}}{2\ell_\Psi} \right)^2 \right].$$

5D action:

$$S_{5D} = \int d^4x \int_0^\rho dy \left[ \mathcal{L}_H - \sum_{i=1}^2 \delta(y - y_i) \psi_{L/R}^{(i)\dagger} (i\not{\partial}) \psi_{L/R}^{(i)} + Y \Psi_L^{(1)\dagger} H \Psi_R^{(2)} + \text{H.c.} \right].$$

KK decomposition of the 5D Higgs field with a VEV:

$$H(x, y) = \frac{v}{\sqrt{\rho}} + \sum_{n=0}^{+\infty} f_n(y) h_n(x), \quad f_0(y) = \sqrt{\frac{1}{\rho}}.$$

- Effective 4D Yukawa coupling with the zero mode Higgs boson:

$$y_0 = Y \int_0^\rho dy \, g(y - y_1) f_0(y) g(y - y_2) = \frac{Y}{\sqrt{8\pi\rho} \ell_\Psi} \exp\left(\frac{-r^2}{8\ell_\Psi^2}\right).$$

Natural 5D Yukawa coupling  $Y \sim \Lambda_\Psi^{3/2}$ , and interbrane distance  $r = |y_2 - y_1| \gg \ell_\Psi$ :

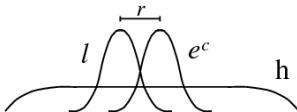

$$y_0 \sim \sqrt{\frac{\ell_\Psi}{8\pi\rho}} \exp\left(\frac{-r^2}{8\ell_\Psi^2}\right) \ll 1!$$

$\Rightarrow$  Nonlocal length scale  $\ell_\Psi$  plays the same role as the domain wall width in AS model.

- Local limit ( $\ell_\Psi \rightarrow 0$ ) of the 5D Yukawa term with  $y_1 \neq y_2$ :

$$Y \psi_L^{(1)\dagger} H \psi_R^{(2)} \rightarrow Y \psi_L^{(1)\dagger} H \psi_R^{(2)} \delta(y - y_1) \delta(y - y_2) = 0.$$

$\Rightarrow$  Fields on different  $\delta$ -like branes cannot interact in a local 5D EFT!

# Conclusion – Summary, Potential Problems & Outlook

## Summary on UV nonlocality:

- Motivated to include gravity in a UV complete quantum theory of Nature.
- Has a smearing effect on interaction vertices & pointlike sources.
- Extra dimensions + branes  $\Rightarrow$  Fuzzy branes.
  - $\Rightarrow$  Brane-fields can interact with naturally suppressed effective 4D couplings.

$\Rightarrow$  New model building issues for both energy & intensity frontiers!

## Potential problems:

- UV nonlocal QFT's usually defined on Euclidean spacetime (Wick rotation not defined: essential singularity at  $\infty$  on the complex plane):
  - $\Rightarrow$  Artificial analytic continuation (S-matrix: only real momenta of asymptotic states).
  - $\Rightarrow$  Lorentzian starting point? UV change of signature? (ex: LQG)
- Simplest nonlocal theories  $\Rightarrow$  Ghosts may reappear in dressed propagators...  
But: Recent formulation where this problem seems to be absent (L. Modesto).

## Outlook:

- Building a consistent nonlocal UV completion of the SM.
    - $\Rightarrow$  gauge hierarchy problem, asymptotic safety, stability of Higgs mass & potential, ...
  - What about interplay with quantum spacetime constructions?  
ex: stochastic spacetimes,  $\kappa$ -Minkowski spacetime, ...
  - Interplay with noncommutative QFT's?
    - $\Rightarrow$  Other UV nonlocal features (Lorentz symmetry breaking, UV/IR mixing, ...).
    - $\Rightarrow$  Constraining gauge groups: only  $U(N)$  in  $\theta$ -Poincaré noncommutative QFT's.
- New results on  $\kappa$ -Minkowski spacetime (J.-C. Wallet).  
 $\Rightarrow U(N)$  gauge theories consistent only in 5D  $\Rightarrow$  extra dimension of space!

Thank you for your attention!
