

SuperNEMO

Neutrinoless Double Beta Decay Experiment
Demonstrator Commissioning Status Update

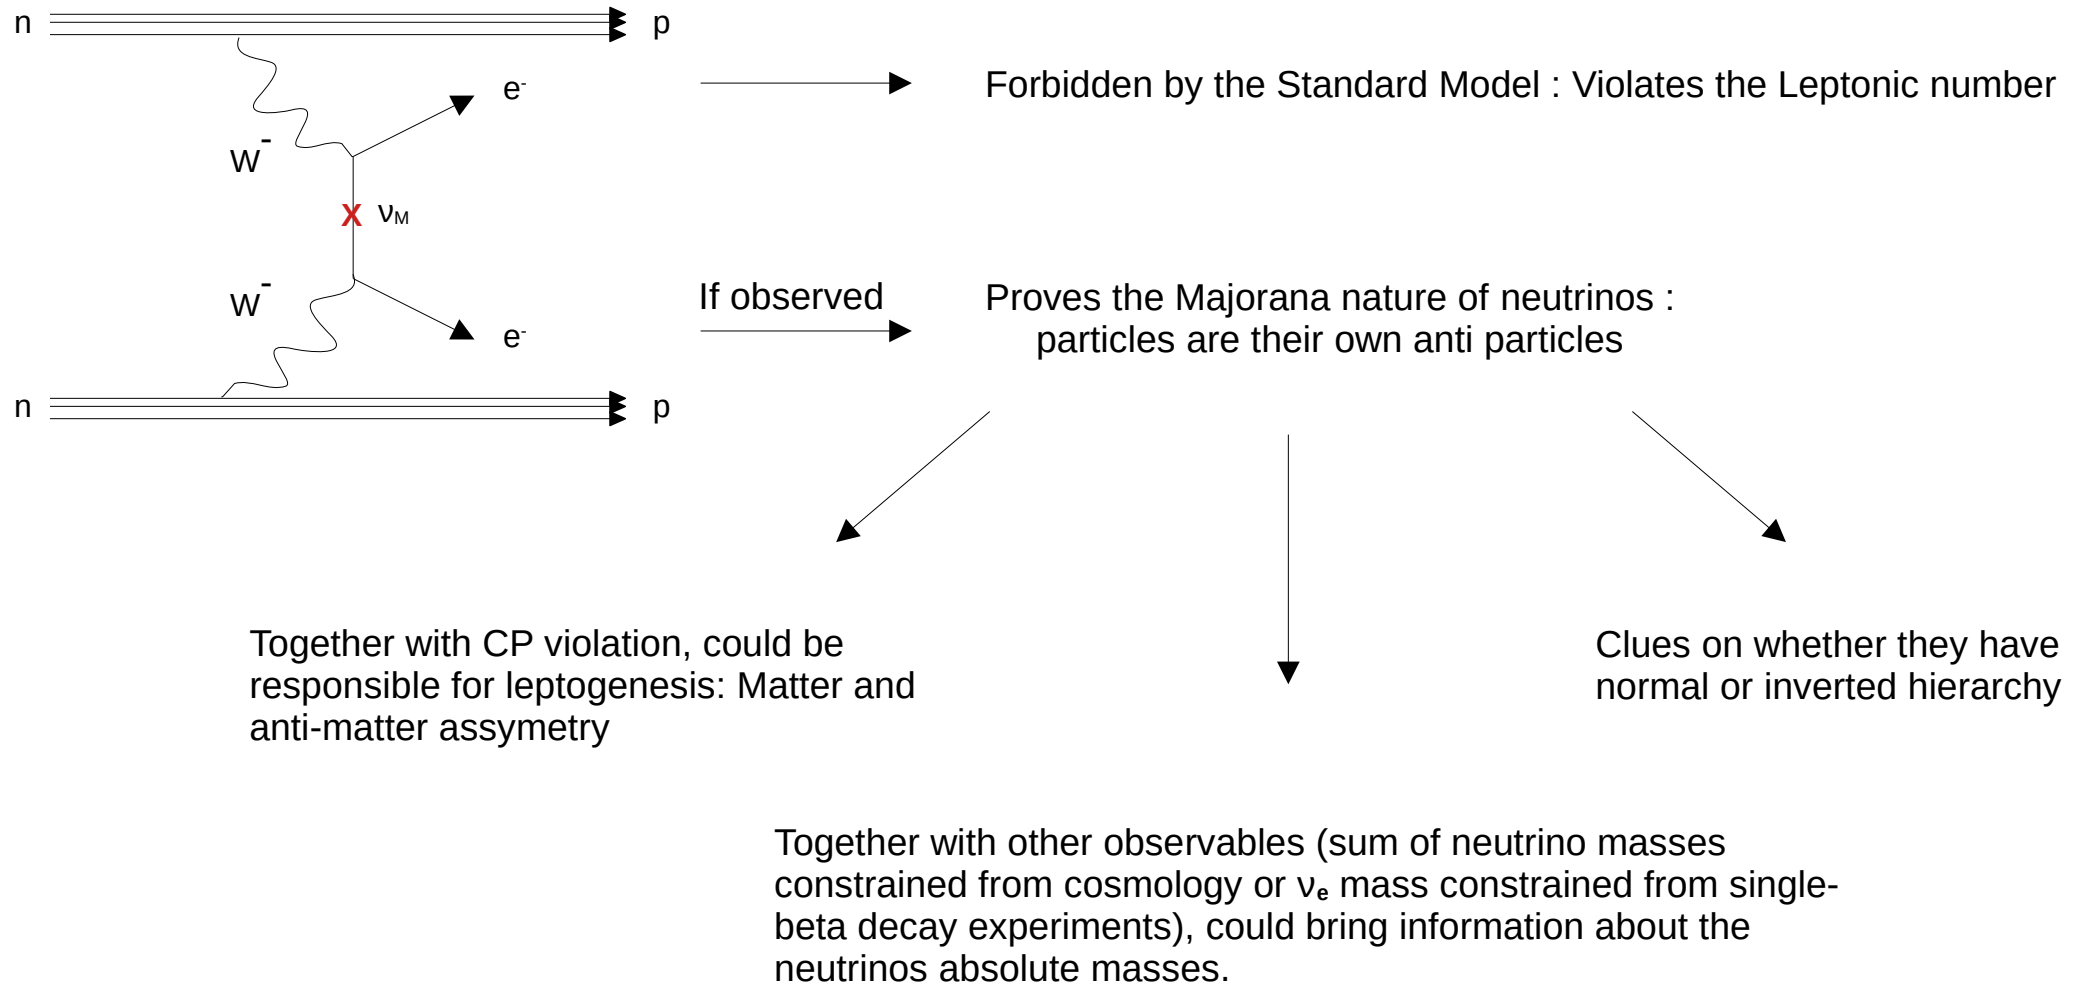

Malak HOBALLAH

On behalf of the SuperNEMO Collaboration

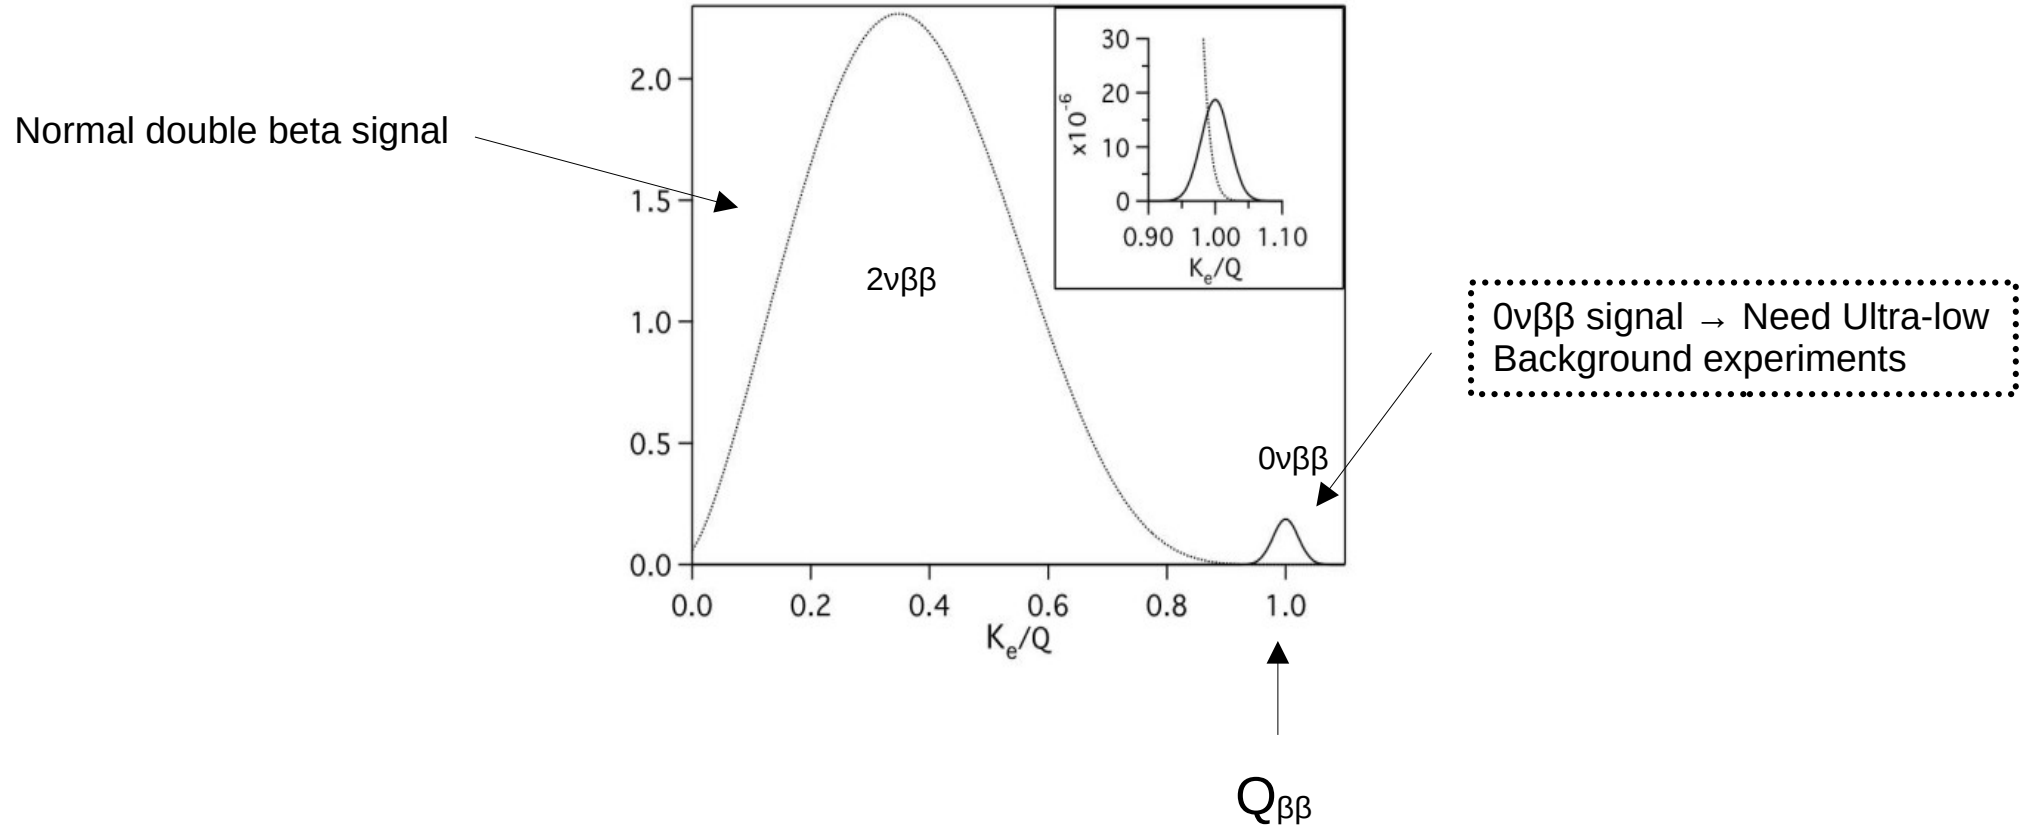

Dec 2, 2021

Neutrinoless Double Beta Decay: A Hypothetical Radioactive Process

Neutrinoless Double Beta Decay: A Hypothetical Radioactive Process Signal

SuperNEMO: Tracker-Calorimeter Detector

SuperNEMO: The Physics

Demonstrator :

- Expected sensitivity: 17.5 kg.y exposure of ^{82}Se
- Measure background contamination

$$T_{1/2}^{0\nu} > 4 * 10^{24} \text{ y}$$

$$\langle m_{\nu} \rangle < (260 - 500) \text{ meV (90\% CL)}$$

More physics :

$0\nu\beta\beta$ Search :

- Different double beta decay mechanisms (Light Majorana neutrino, right handed currents, ...) using the full kinematics (single electron energy and angular distribution)

$2\nu\beta\beta$ Study:

- Quenching of axial-vector coupling constant (g_A)
- Higher State Dominance (HSD) and Single State Dominance (SSD)
- Exotic Decays (Majoron ($n = 2, 3, 7$), Lorentz violation and Bosonic neutrino)

The SuperNEMO Demonstrator Source

6.23 kg of ^{82}Se as $\beta\beta$ source

$$Q_{\beta\beta} = 2.998 \text{ MeV}$$

$$T_{1/2}^{2\nu} = 9.4 \times 10^{19} \text{ y}$$

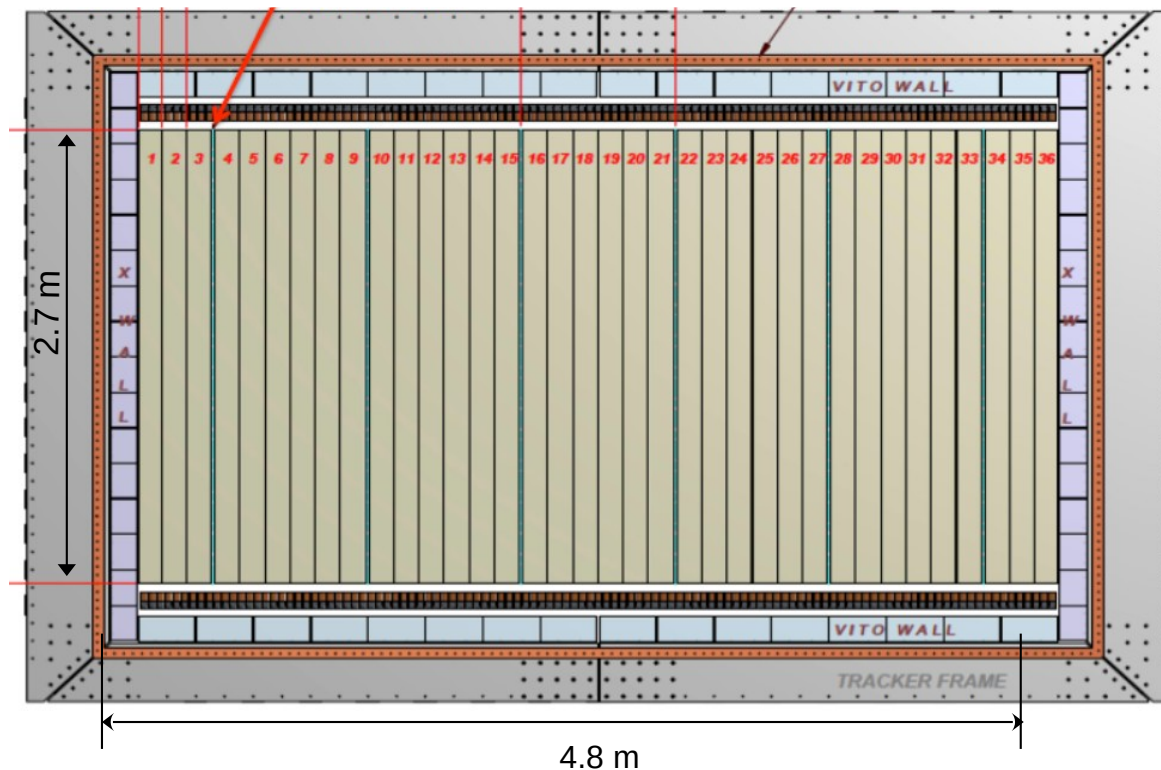

(NEMO-3)

Radio-Purity of ^{82}Se foils	Specifications ($\mu\text{Bq/kg}$)	Measured values for best source using BiPo-3 detector ($\mu\text{Bq/kg}$)
^{208}Tl	< 2	$\sim 20 \pm 10$
^{214}Bi	< 10	< 290 at 90% CL

Required for 500 kg.y exposure (100 kg, 5 years)

For source of demonstrator of 17.5 kg.y exposure

Selenium Source Foils Geometry

The SuperNEMO Tracker

2034 drift cells operating in Geiger mode

3D reconstruction of charged particle tracks
(μ^\pm , e^\pm , α)

¼ tracker under construction

Over pressure of 10 mbar is achieved inside tracker chamber

	Specifications	Measurements can be extrapolated to a tracker gas flux of 2 m ³ /h
Radon emanation (mBq/m ³)	0.15	0.16 ± 0.05

Already commissioned and data to be analyzed

The SuperNEMO Calorimeter

440 8" PMTs
&
232 5" PMTs

712 Optical
Modules

8" PMTs

Energy resolution 8%
FWHM at 1 MeV
(14% - 17% for NEMO-3)

Time resolution < 400 ps for
electrons @ 1 MeV

Experiment	^{40}K (Bq)	^{226}Ra (Bq)	^{232}Th (Bq)
SuperNEMO Demonstrator	540	197	124
NEMO-3	832	302	49.4
Relative activity (A(SN)-A(NEMO-3))/A(NEMO-3)	-35%	-35%	+151%

Operational and taking data since 2018!

Not the dominant
background for 2ν
and 0ν search

SuperNEMO: Hardware Status

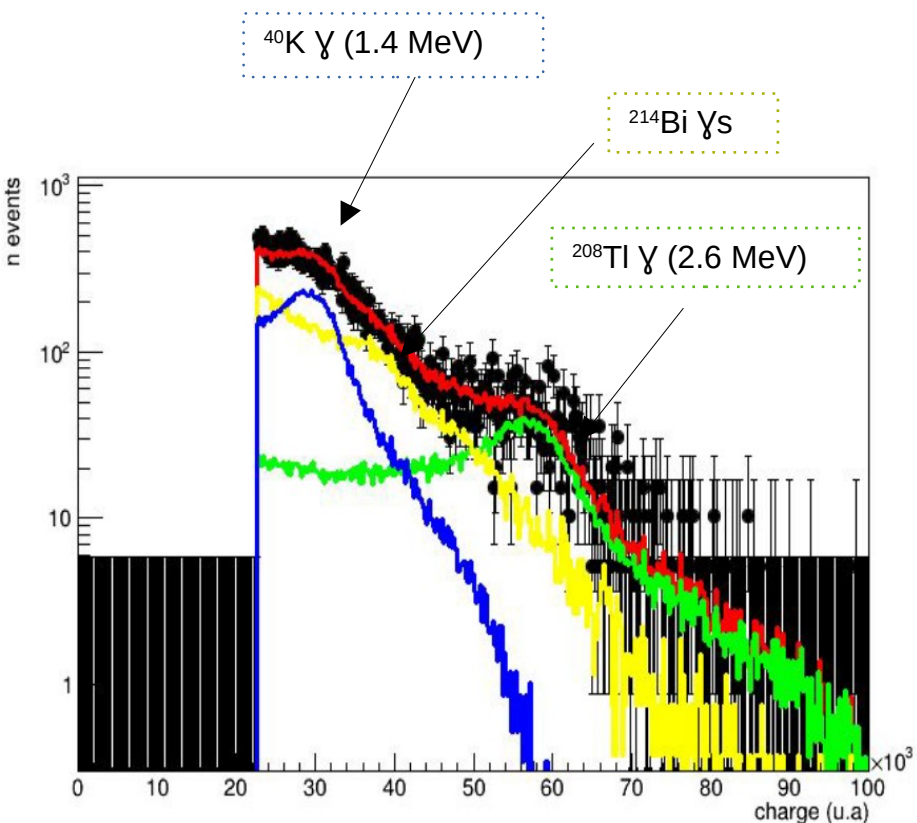

Magnetic field coils
25G

(Summer 2021)

Energy Calibration

Optical corrections were taken into account:

Non-Linear Effects with Energy:

- Birks Effect
- Cherenkov Effect

Geometrical Corrections:

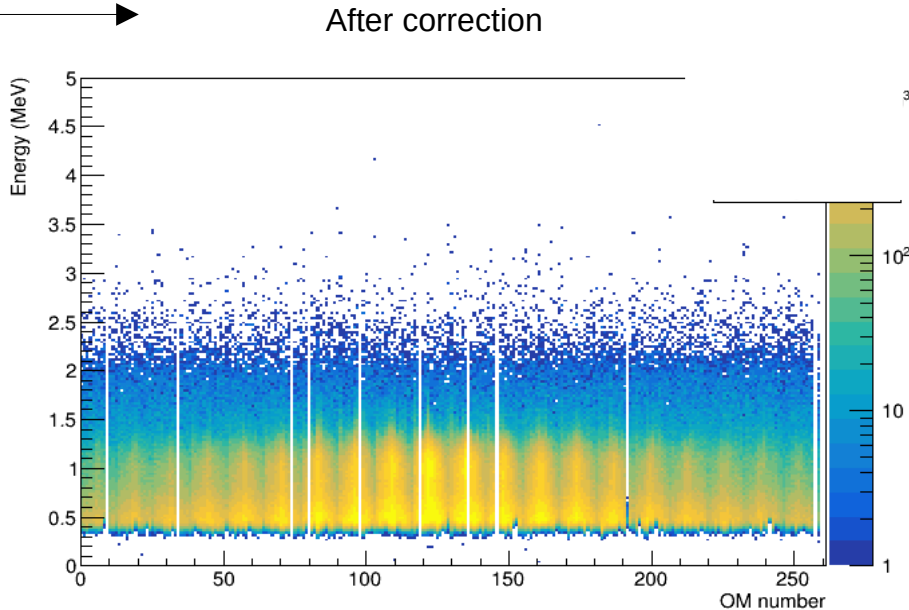

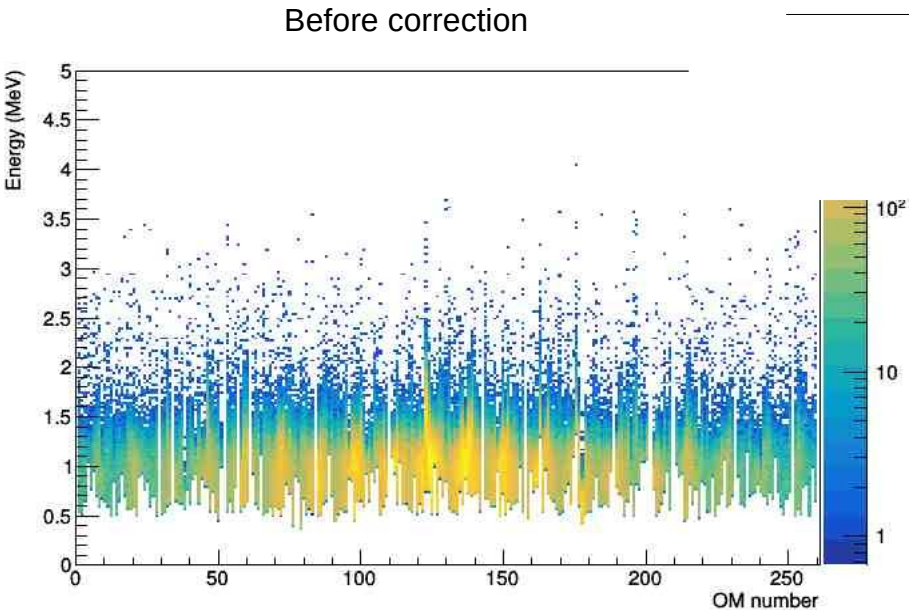

- Interaction point

→ Obtain amplitude gain that will be used to adjust HV for each PM

Energy Calibration, First Results

Old results that do not take into account optical corrections

Time Resolution and Time Calibration of OMs Using ^{60}Co Runs

Time resolution for γ s @ 1MeV for all OMs

For 8" OMs : $0.614 \pm 0.002 \text{ (stat)} + 0.064 \text{ (sys)} - 0.000 \text{ (sys)} [ns]$
 For 5" OMs : $0.814 \pm 0.006 \text{ (stat)} + 0.073 \text{ (sys)} - 0.000 \text{ (sys)} [ns]$

→ To be done with e^-s

2- Time offset in each OM is unique per OM, it takes into account: cable length + total delays inside (electronics, scintillation time, ...)

Mean value of Δt distributions

NOTATION:

wait,module,side,col,row

wait,module,col,row

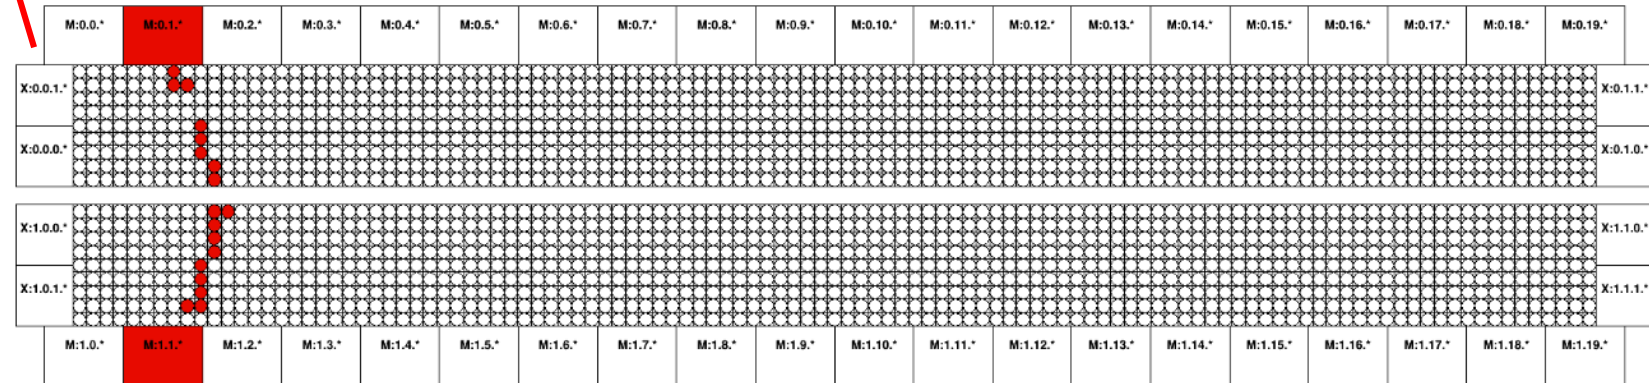

Color scale: Final offset values / OM [ns]

The time calibration performed **achieved ~ 0.2 [ns] precision on timing** after applying the calibration.
Enough to reject background using time of flight measurements.

Tracker Commissioning, September 2021

Tracker commissioned in stages due to the arrival of the tracker HV crates → 7 areas commissioned separately

Example tracker +
calorimeter signal
visualization

Tracker Commissioning, Cathode Drift Time

Effect of neighbouring cell electric field

Conclusion

- The calorimeter is commissioned, working and taking data since 2018.
- The tracker is commissioned and taking data since September 2021 -> Data to be analyzed
- A time calibration of the calorimeter walls is done.
- Preliminary time resolution is extracted for γ s @ 1 MeV \rightarrow To be done with e^- s using ^{207}Bi calibration source .
- Energy Calibration of the Calorimeter walls is done, improvements are being worked on.

Quenching of g_A

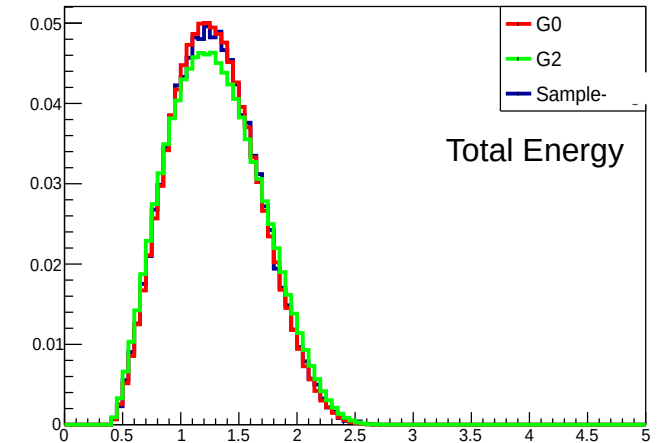

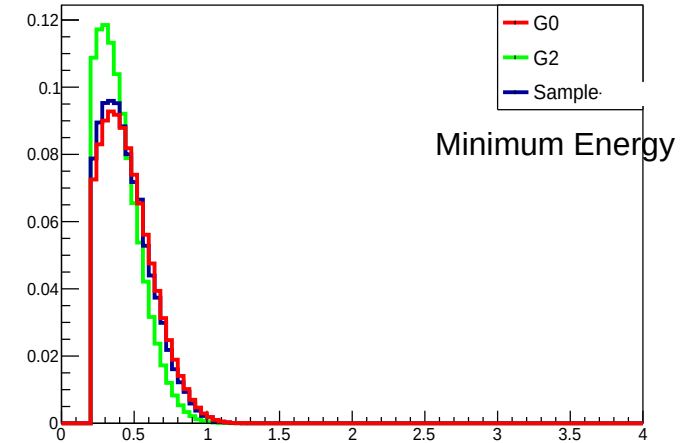

F.Šimkovic et al. Phys. Rev. C 97, 034315 (2018)

$$[T_{1/2}^{2\nu\beta\beta}]^{-1} \simeq (g_A^{eff})^4 [M_{GT-3}^{2\nu}]^2 \frac{1}{[\xi_{31}^{2\nu}]^2} (G_0^{2\nu} + \xi_{31}^{2\nu} G_2^{2\nu})$$

$2\nu\beta\beta$ processes with
different kinematics

Where $\xi_{31}^{2\nu} = \frac{M_{GT-3}^{2\nu}}{M_{GT-1}^{2\nu}}$

Determines the contribution
of G0 and G2

arXiv:1901.03871v1 [hep-ex] 12 Jan 2019

FIG. 3: Effective axial-vector coupling g_A^{eff} as a function of the matrix element $M_{GT-3}^{2\nu}$ for ^{136}Xe $2\nu\beta\beta$ decay. The yellow (light yellow) region $\xi_{31}^{2\nu} < 0.26$ (0.05) is excluded by the present KamLAND-Zen measurement at 90% (1σ) C.L. Nuclear shell model results are displayed by the blue circle (GCN interaction) and black square (MC). QRPA results are shown by the dashed orange (Argonne interaction) and dashed-dotted green (CD-Bonn) curves.
