

# Prompt gamma camera developments at CNAO

Carlo Fiorini

Politecnico di Milano and INFN Milano, Italy

*carlo.fiorini@polimi.it*

# The RADLAB team

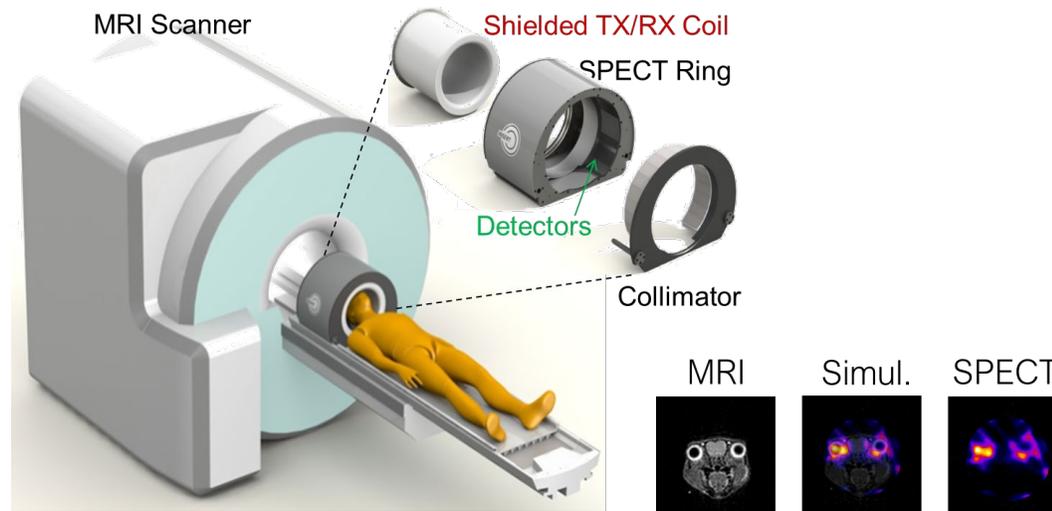

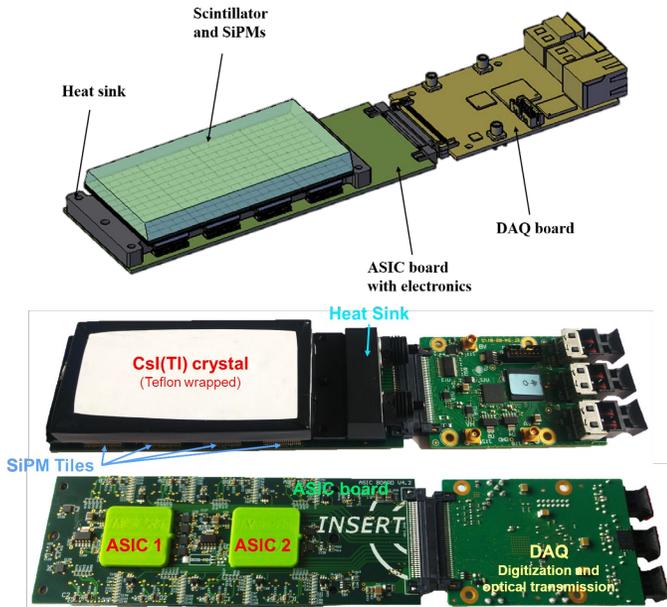

POLITECNICO  
MILANO 1863

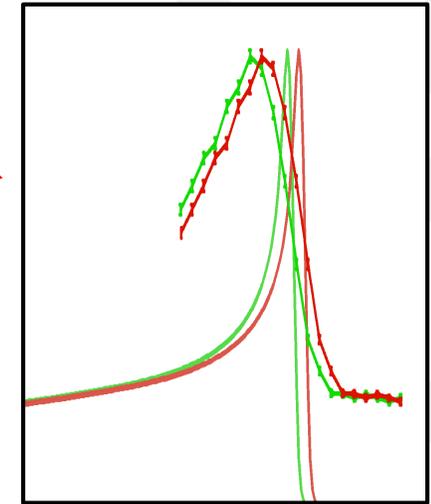

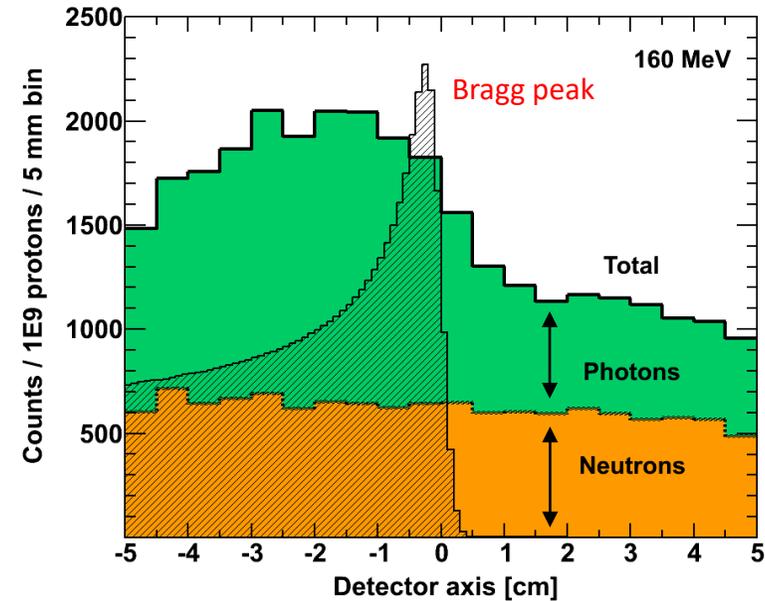

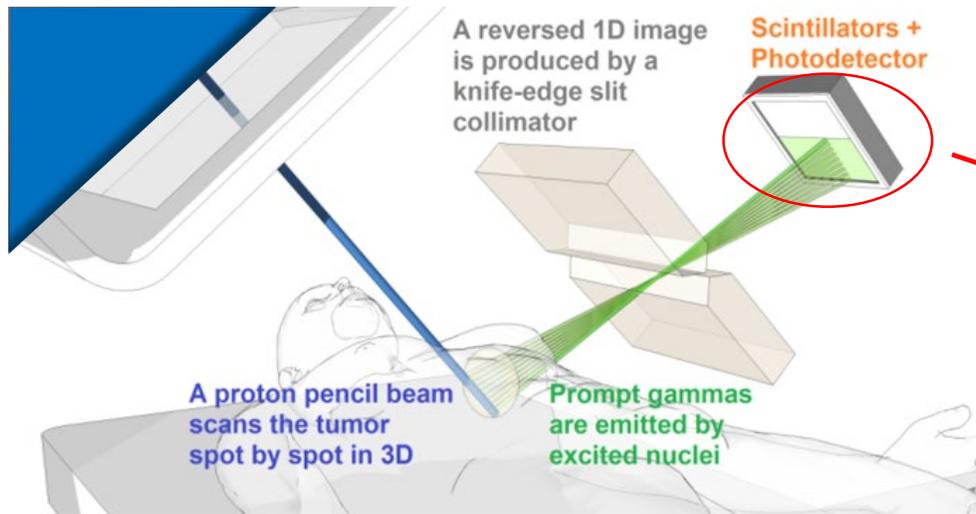

- 2 staff, 10 Ph.D. students and post-docs, 20 M.Sc. thesis students
- CAD workstations, detectors and electronics assembly and test instrumentation, Wire bonding and Flip Chip, 3D printers, vacuum and climatic chambers, photon sources,...

**Focus: development of radiation detectors and readout electronics, full detection modules and instrumentation for physics, medical imaging and industry**

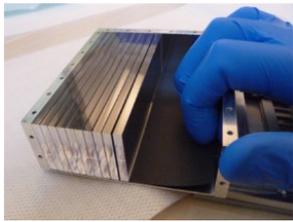

# Range verification through Prompt Gammas Imaging (PGI)

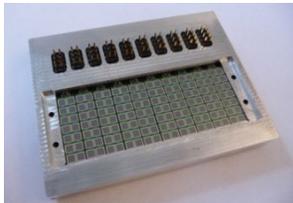

Principle of **prompt-gamma** measurement through a 1D imaging camera. The measured profile of gamma rays shows correlation with the fall-off of the Bragg peak. Contribution from secondary radiation, as neutrons, do not show relevant correlation and contribute mainly to background noise.

A potential tool to **real-time range verification** during irradiation against deviations with respect to the treatment planning, such as patient mis-positioning, organ motion or anatomic changes between fractions.

# Previous experience using PGI with protons irradiation

500 cm<sup>3</sup> LYSO slabs

SiPMs readout

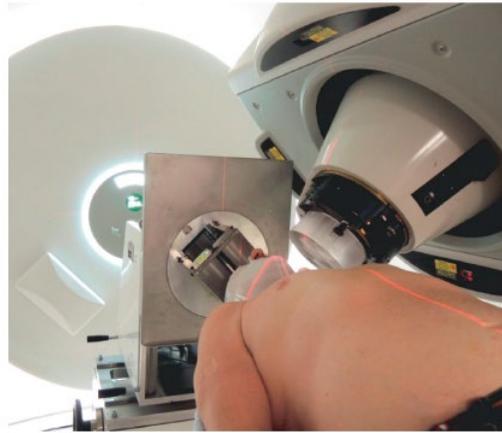

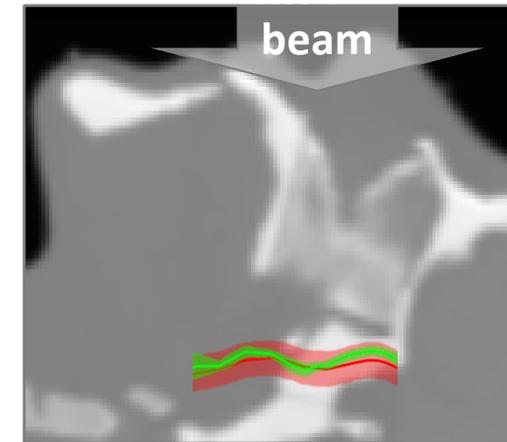

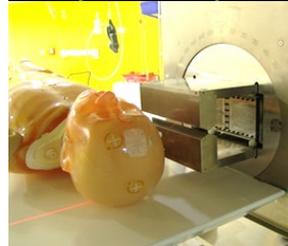

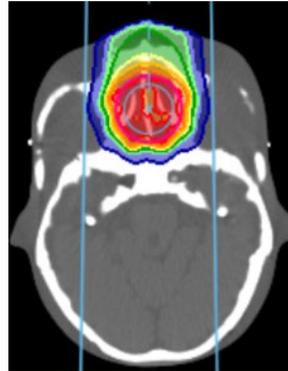

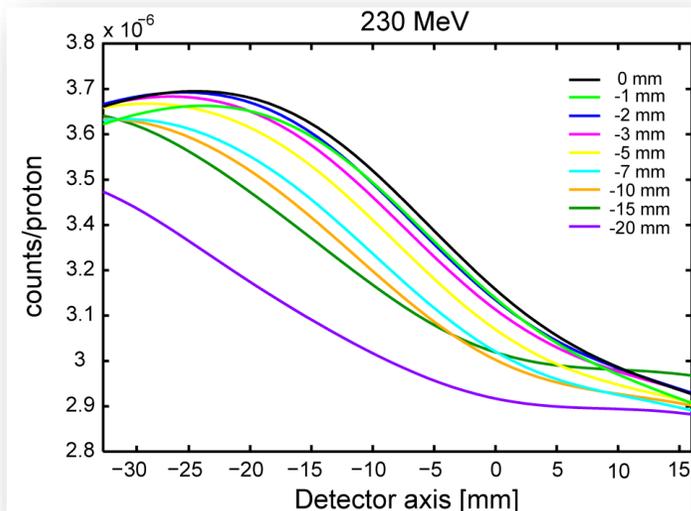

Fig. 1. PGI slit camera trolley (upper row) and its application during patient treatment (lower row).

Planning uncertainty > 5 mm  
(margin of 3.5% + 2 mm)

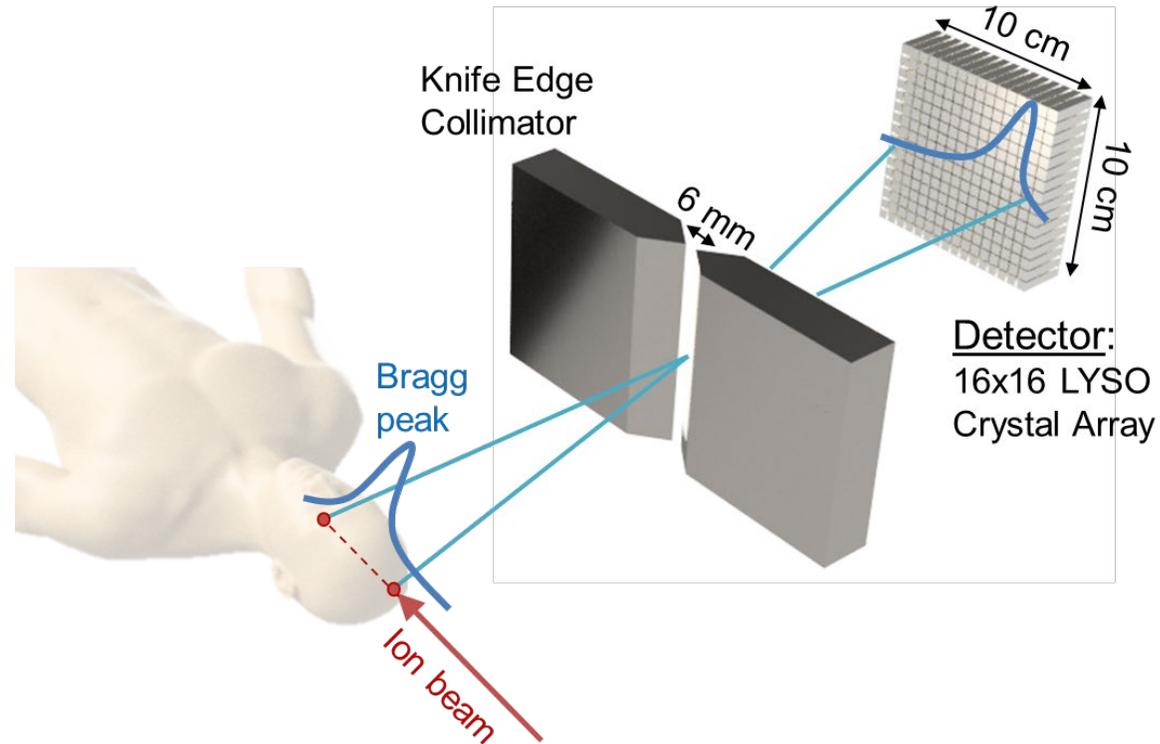

Measurement uncertainty (1.5 $\sigma$ )  
 $\approx$  2.0 mm

Shift measurements

# Study of PGI with carbon irradiation at CNAO

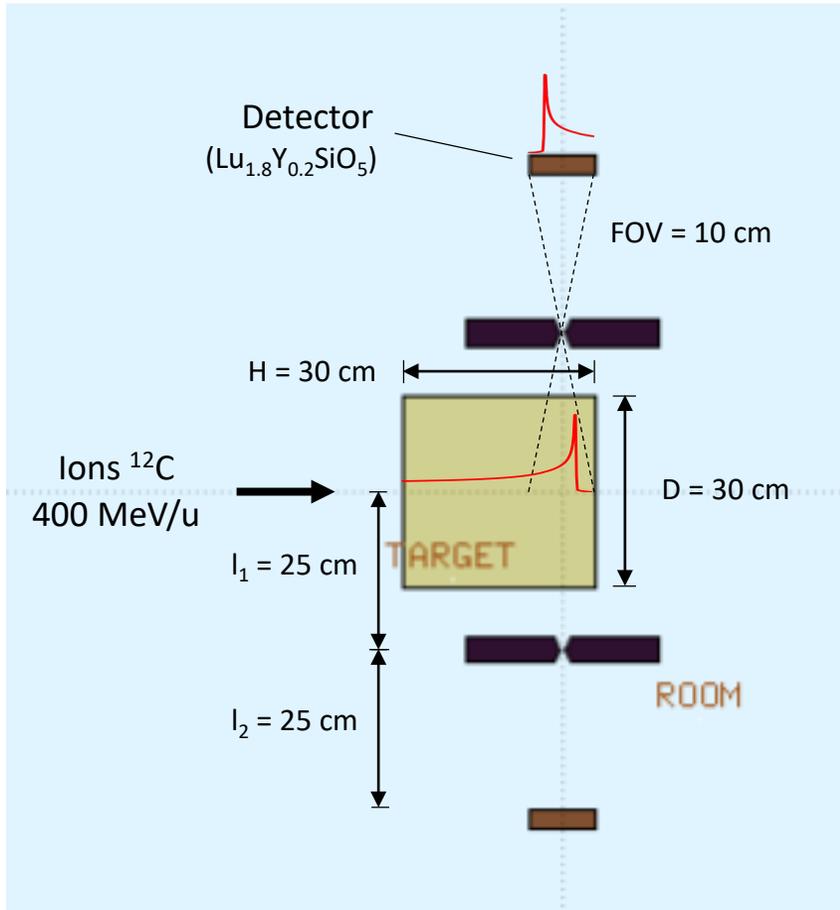

## Challenges:

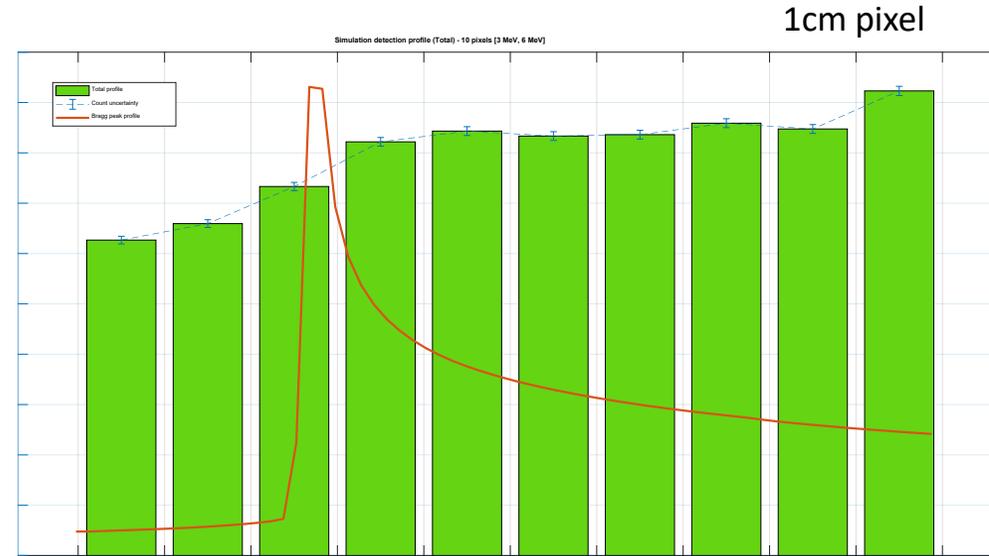

- Two orders of magnitude less carbon ions than protons used for irradiation (issue partially compensated by higher PG yield of carbon vs. proton)
- Secondary gammas reduces the range-end falloff
- Higher neutron background (vs. proton irradiation)

# Preliminary simulations

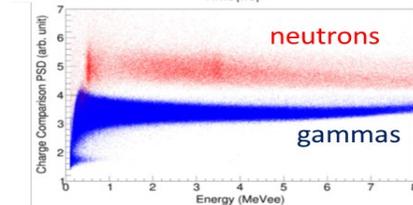

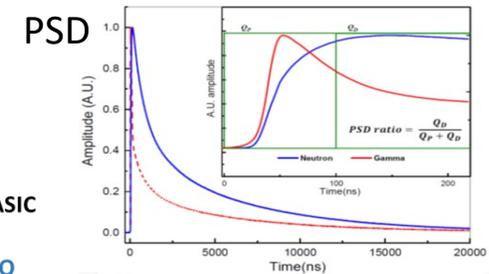

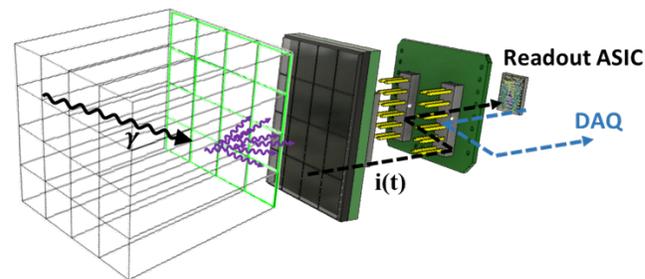

Activity in collaboration with POLIMI Energy Department (S.Agosteo, F.Casamichiela, ...)

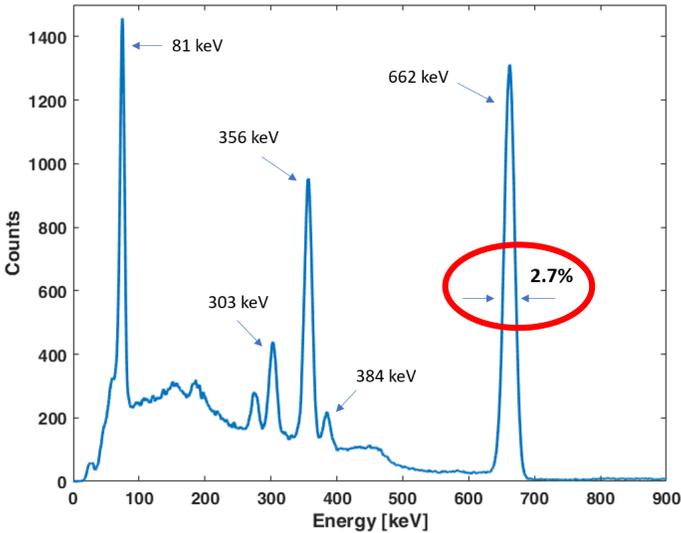

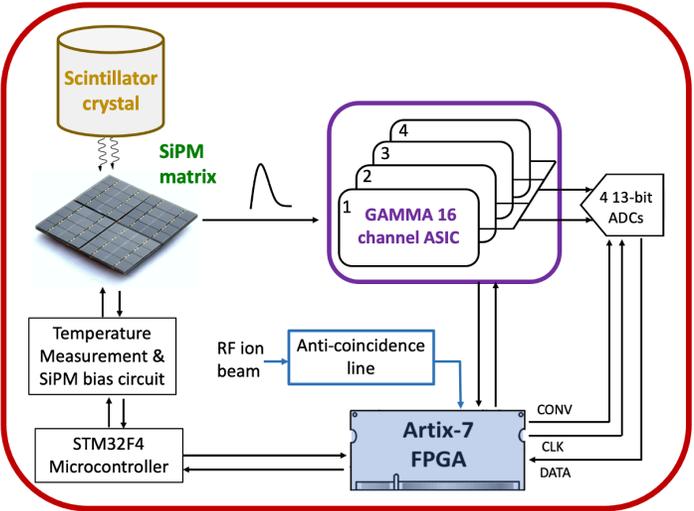

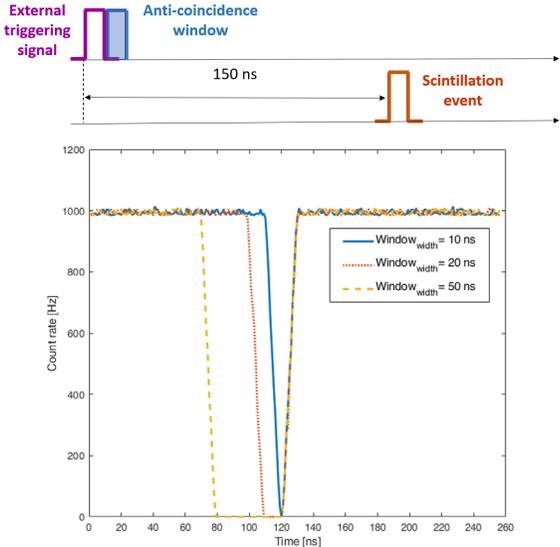

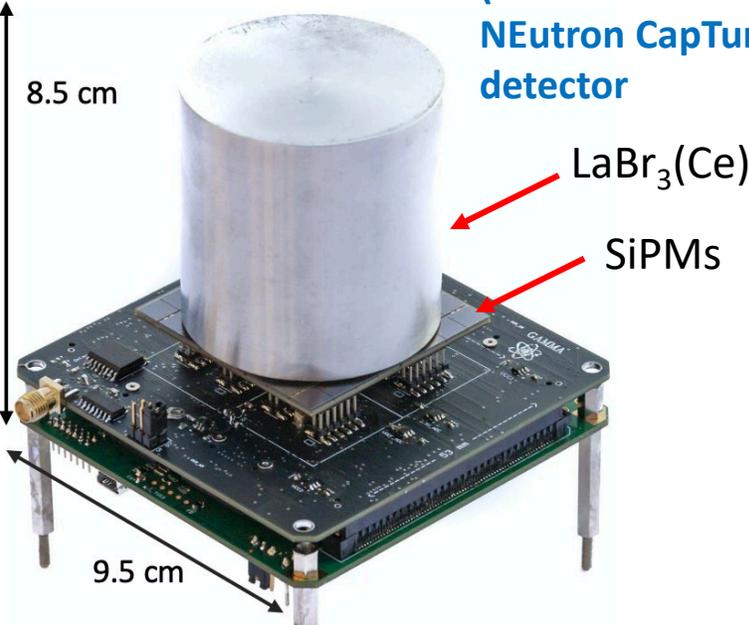

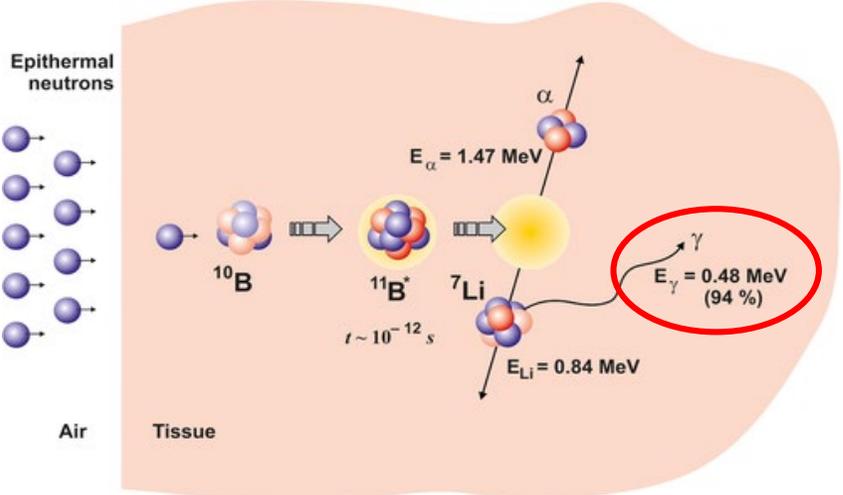

## Next...detector development

### LYSO-SiPM-ASIC unit

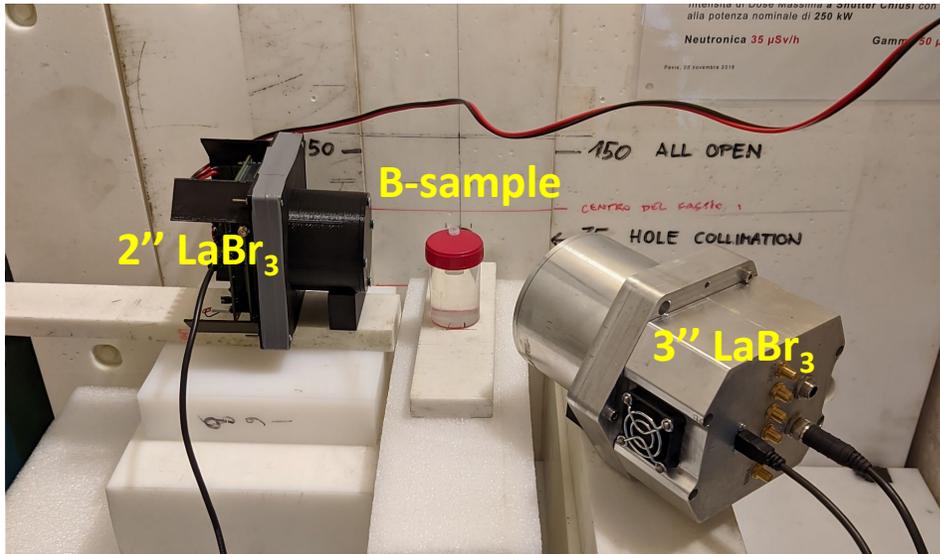

# Gamma detection in BNCT

The **BENEdiCTE**  
(Boron Enhanced  
NEutron CapTurE)  
detector

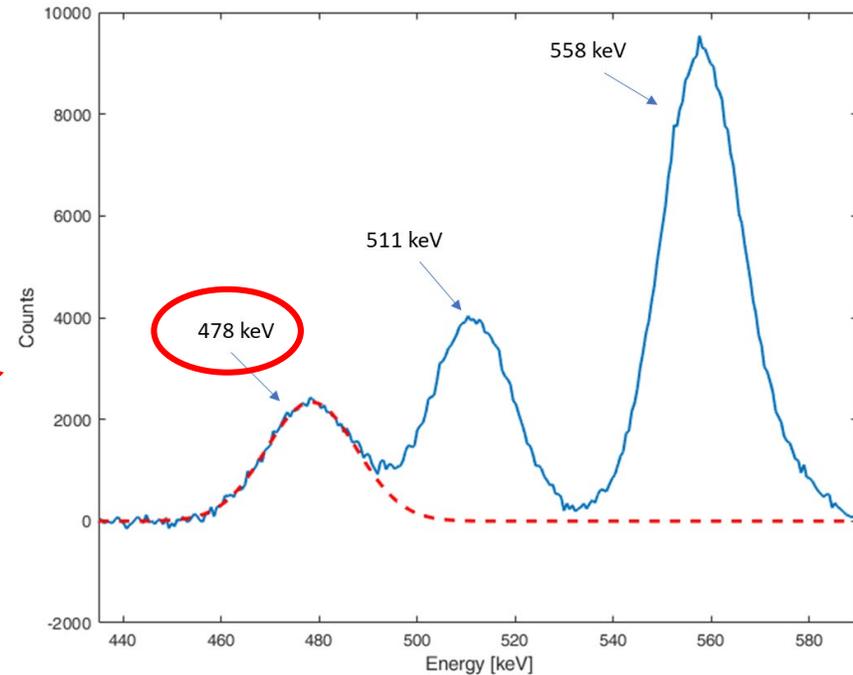

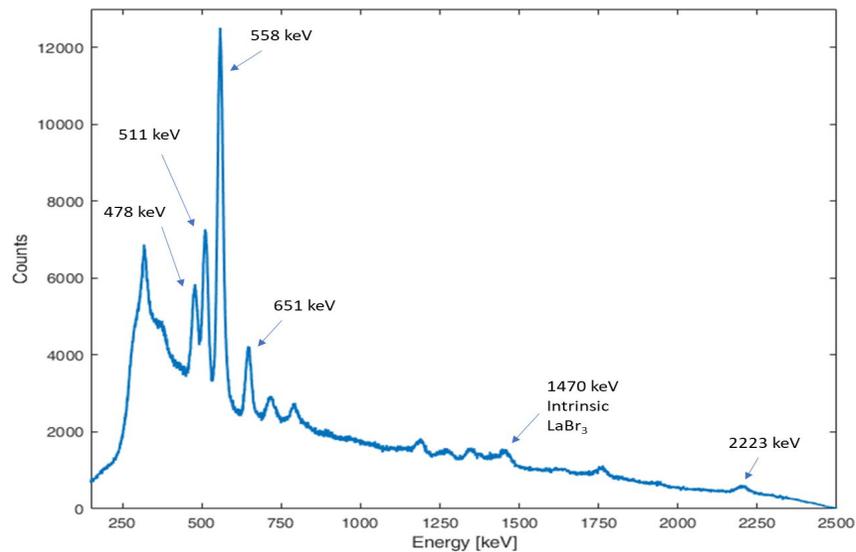

# First measurements

Measurements at LENA reactor  
University of Pavia (S.Altieri, N.Protti)

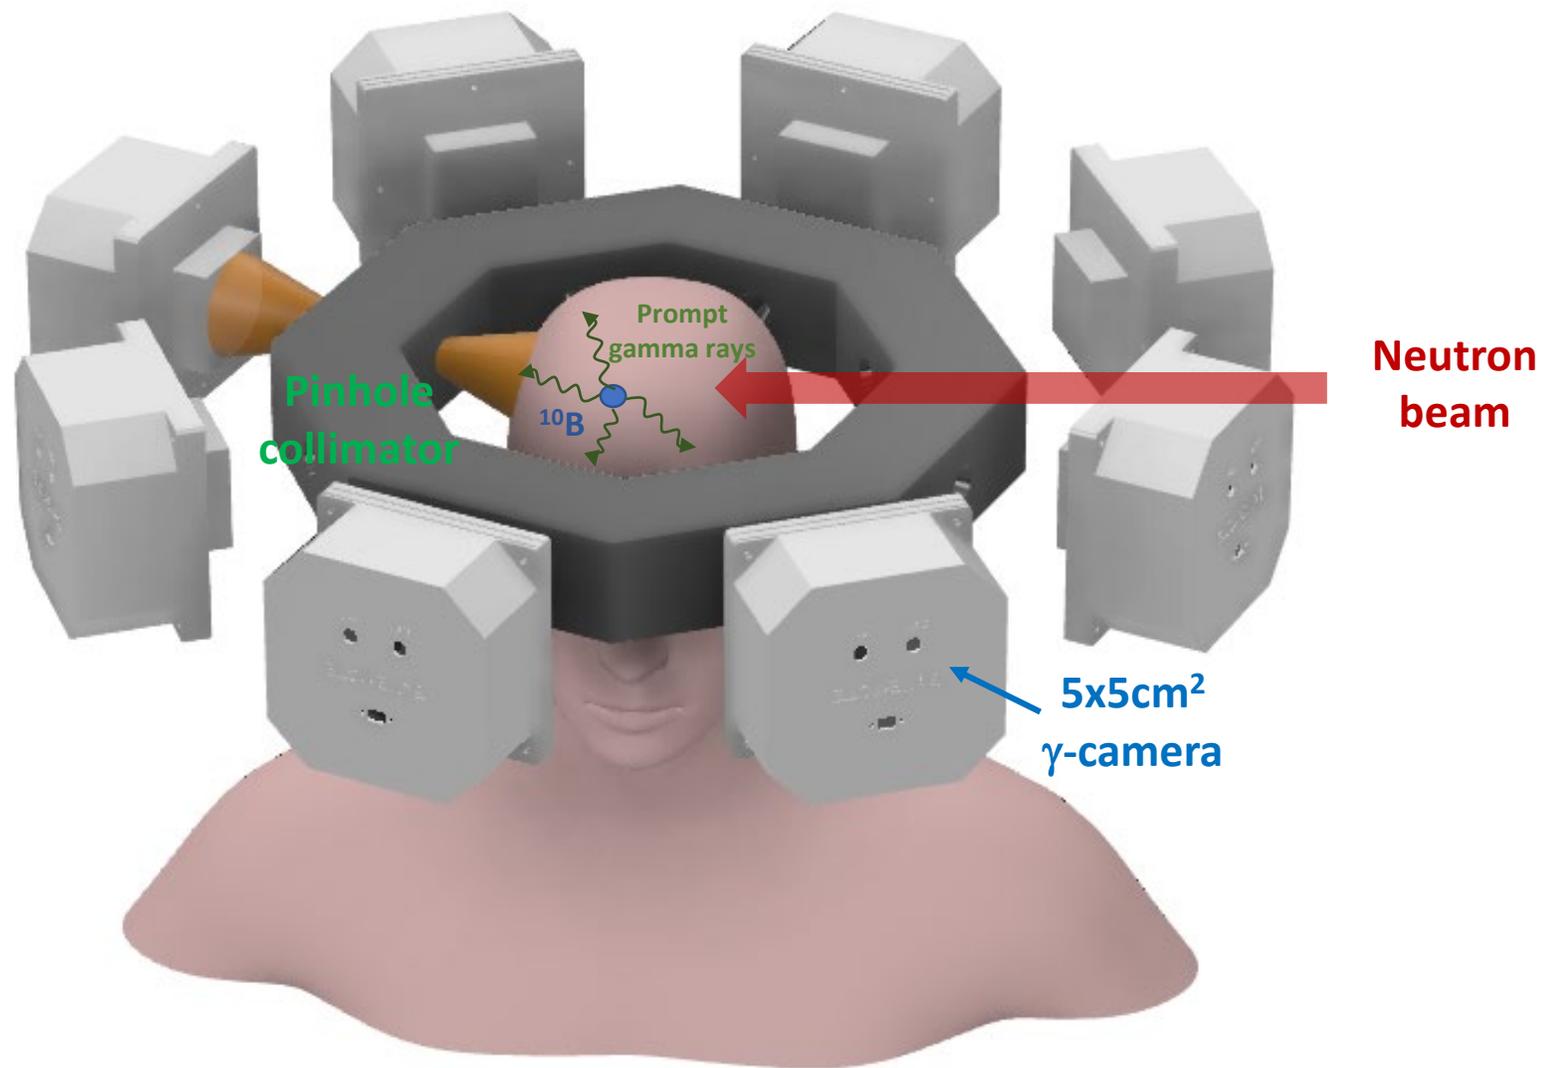

Peak's origin	Energy [keV]	Resolution [%]
Boron neutron capture	478	5
Annihilation photons	511	4
Cadmium neutron capture	558	3.6
Cadmium neutron capture	651	3.1
Hydrogen neutron capture	2223	1.2

Neutron flux:  $\sim 10^5 \text{ cm}^{-2}\text{s}^{-1}$   
1000ppm  $^{10}\text{B}$   
15min. measurement

Minimum  $^{10}\text{B}$ -concentration  
of **60ppm** detected  
(data analysis ongoing)

# A first step towards a SPECT for BNCT?

# Outlook

- Development of gamma-ray detectors, electronics and instrumentation for gamma-ray measurements applied to dose verification in carbon-ion irradiation and BNCT.
- This is a starting activity and it is open for collaborations!
