

# Gravitational Wave Bursts Produced by Cosmic Strings Cusps

Florent Robinet

# Gravitational Waves

Black hole merger

**Gravitational waves** = "ripples" in space-time

**Weak field approximation :**  $g_{\mu\nu} = \eta_{\mu\nu} + h_{\mu\nu}$   $|h_{\mu\nu}| \ll 1$

**Wave equation, speed  $c$**

**Solution with 2 d.o.f. : polarizations  $h_+$  and  $h_x$**

**Dimensionless amplitude given by  $h$**

**Production of gravitational waves**

$$\mathcal{L} = \frac{c^5}{G} \epsilon^2 \left( \frac{R_s}{R} \right)^2 \left( \frac{v}{c} \right)^6$$

**A good GW source :**

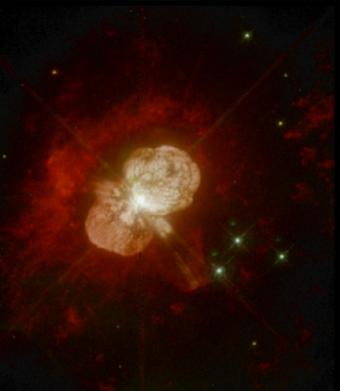

- is compact and massive
- is asymmetric
- has a relativistic speed

**Lab production :**  $h \sim 10^{-39}$

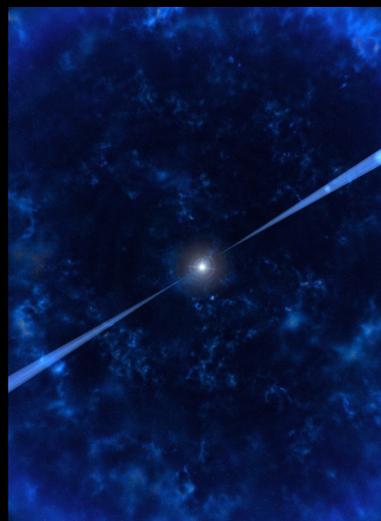

**Astrophysical sources :**  $h \sim 10^{-21}$

# Gravitational Wave Sources

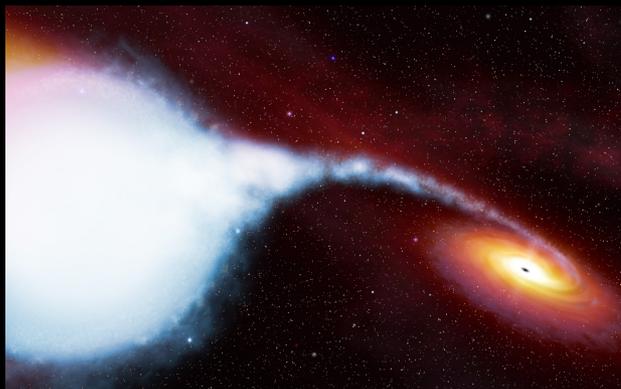

**Supernovae**  
(asymmetric core  
bounce)

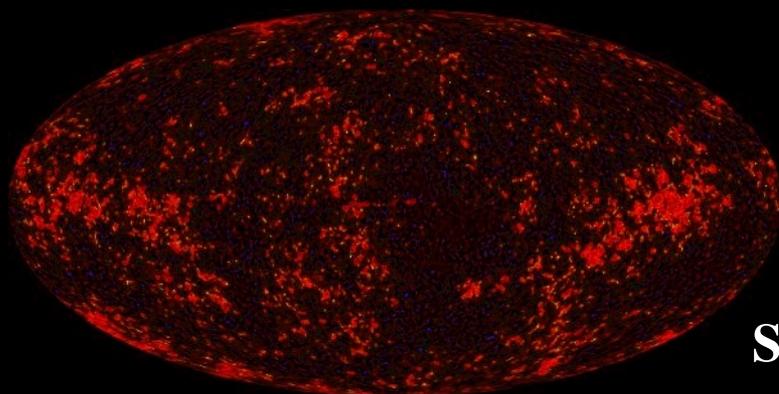

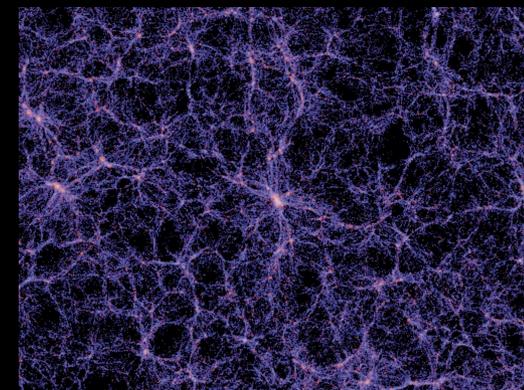

**Pulsars**  
(asymmetric rotations,  
instabilities)

**Compact binary  
coalescence of neutron  
stars &/or black holes**

**Cosmic string cusps**

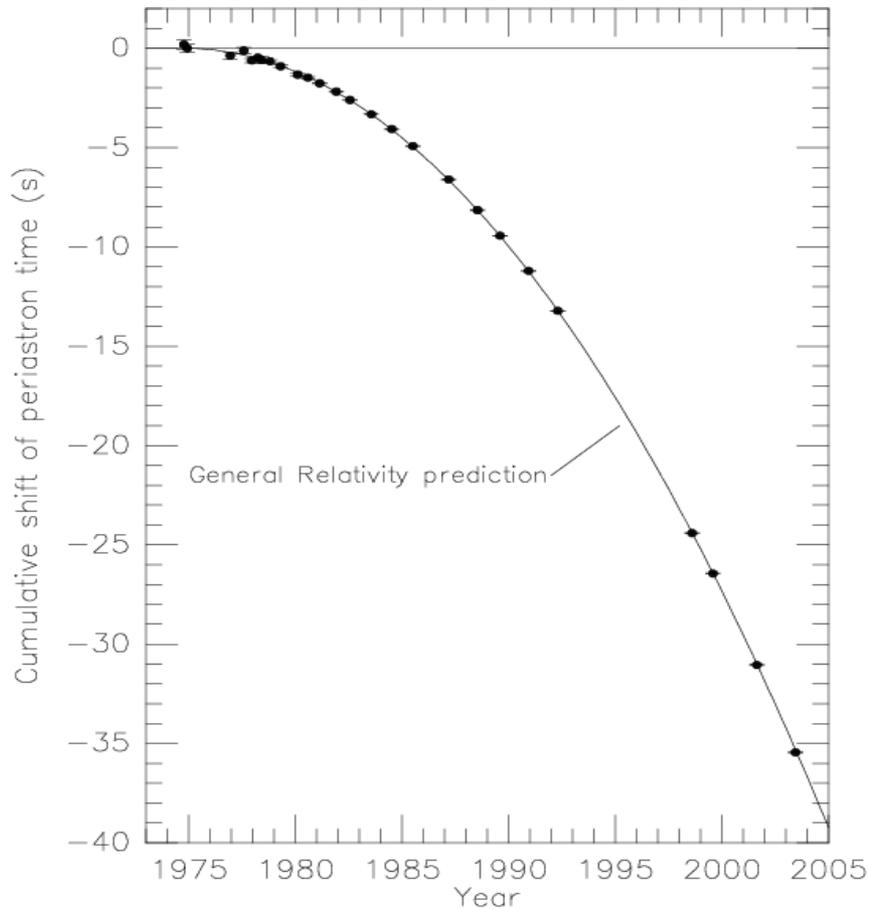

**The unexpected**

**Stochastic background**

# They are real !

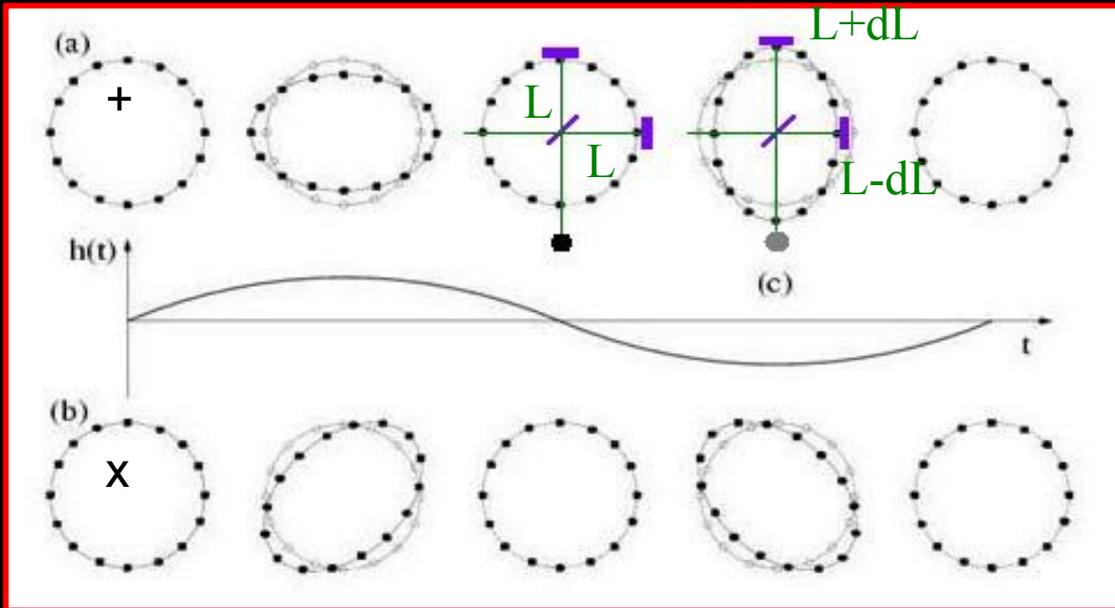

## Binary pulsar PSR 1913+16

The decrease of the orbital period has been studied over more than 20 years

It can be fully explained by the energy loss due to the emission of gravitational waves

Nobel Prize 1993 Hulse-Taylor

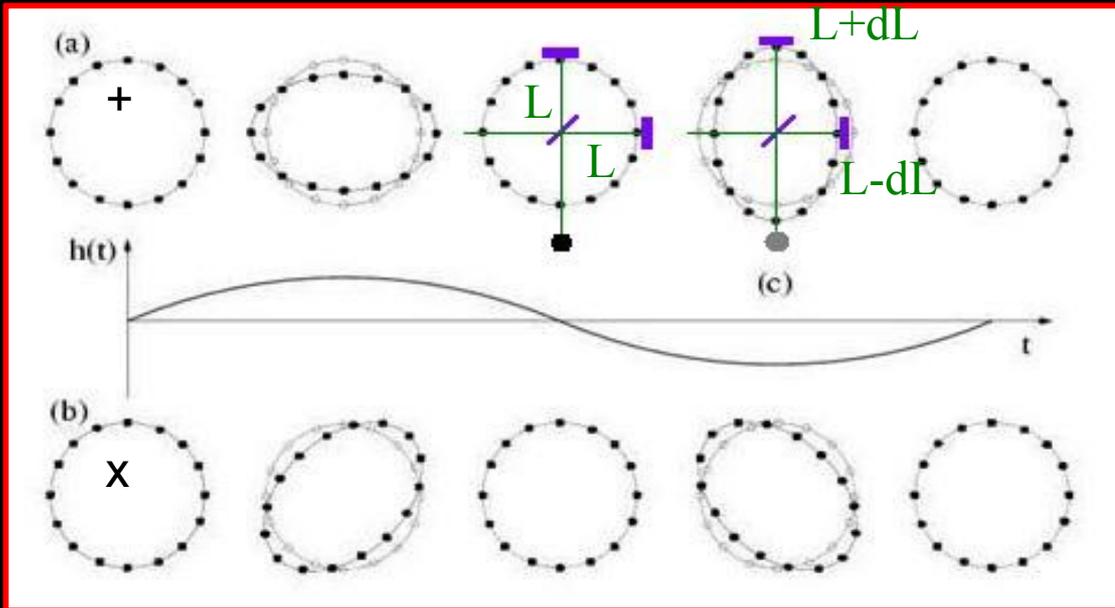

# Detection of Gravitational Waves

The interferometry seems to be appropriate

Differential length variations can be measured with a Michelson interferometer

# Detection of Gravitational Waves

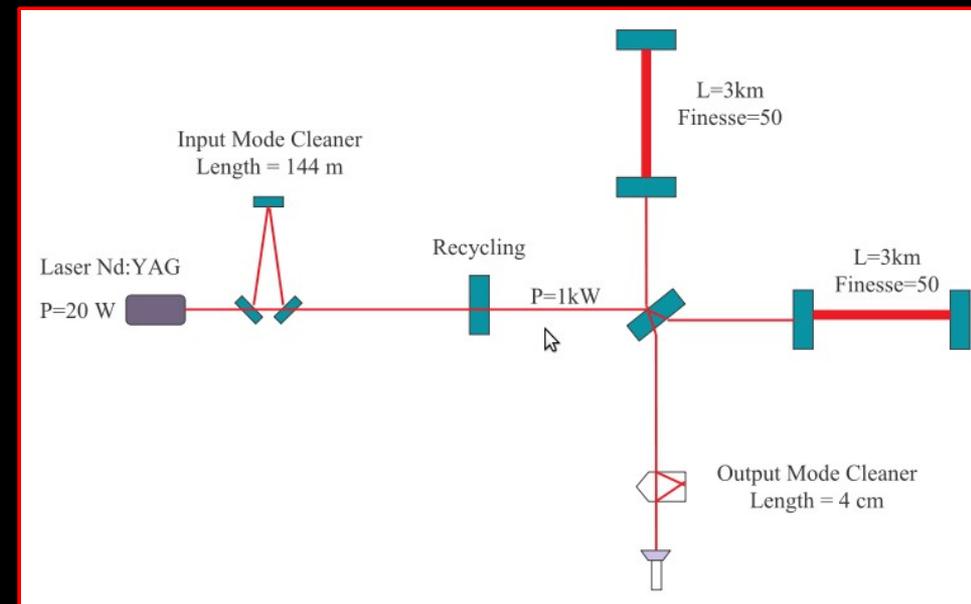

The interferometry seems to be appropriate

Differential length variations can be measured with a Michelson interferometer

To be able to detect gravitational waves with  $h < 10^{-21}$  the basic concept of the Michelson needs to be improved :

- Kilometric arms
- Fabry-Perot Cavities
- High power laser
- Power recycling
- Noise limitation

# The Virgo Interferometer

Pisa

# The Virgo Interferometer

Pisa

**1<sup>st</sup> Science Run : May → Oct 2007 : VSR1**

**Duty cycle = 81 %**

**Long locks up to 94h**

**Range for a 1.4-1.4  $M_{\odot}$  system : ~4Mpc**

## **Commissioning**

**Higher laser power**

**Thermal compensation of the mirrors**

**New control of the interferometer**

**New electronics**

**Better scattered light mitigation**

## **2<sup>nd</sup> Science Run**

**7<sup>th</sup> of July 2009 → Jan 2010 : VSR2**

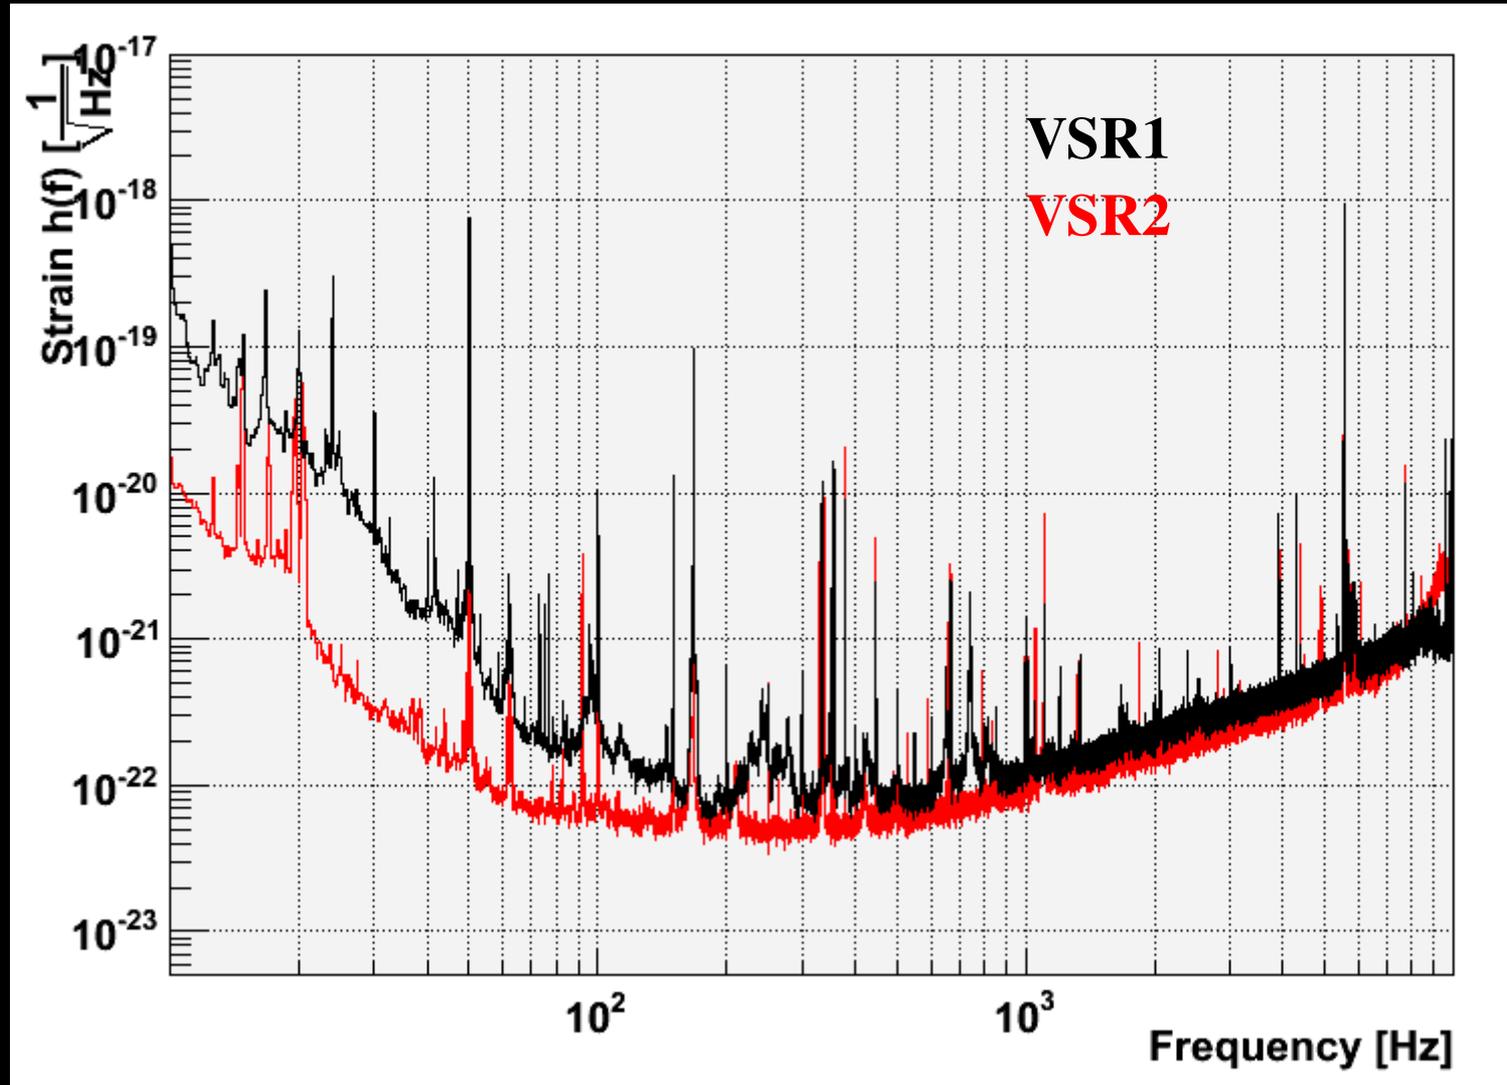

**Duty cycle = 81 %**

**Long locks up to 150h (world record !)**

**Range for a 1.4-1.4  $M_{\odot}$  system : ~9Mpc**

# Virgo Sensitivity

# A Network of Detectors

**Virgo (3 km)**

## **LSC – Virgo collaboration**

- Full data sharing since May 2007
- Common analyses and papers
- Common tools

**Livingston (4 km)**

**Geo (600 m)**

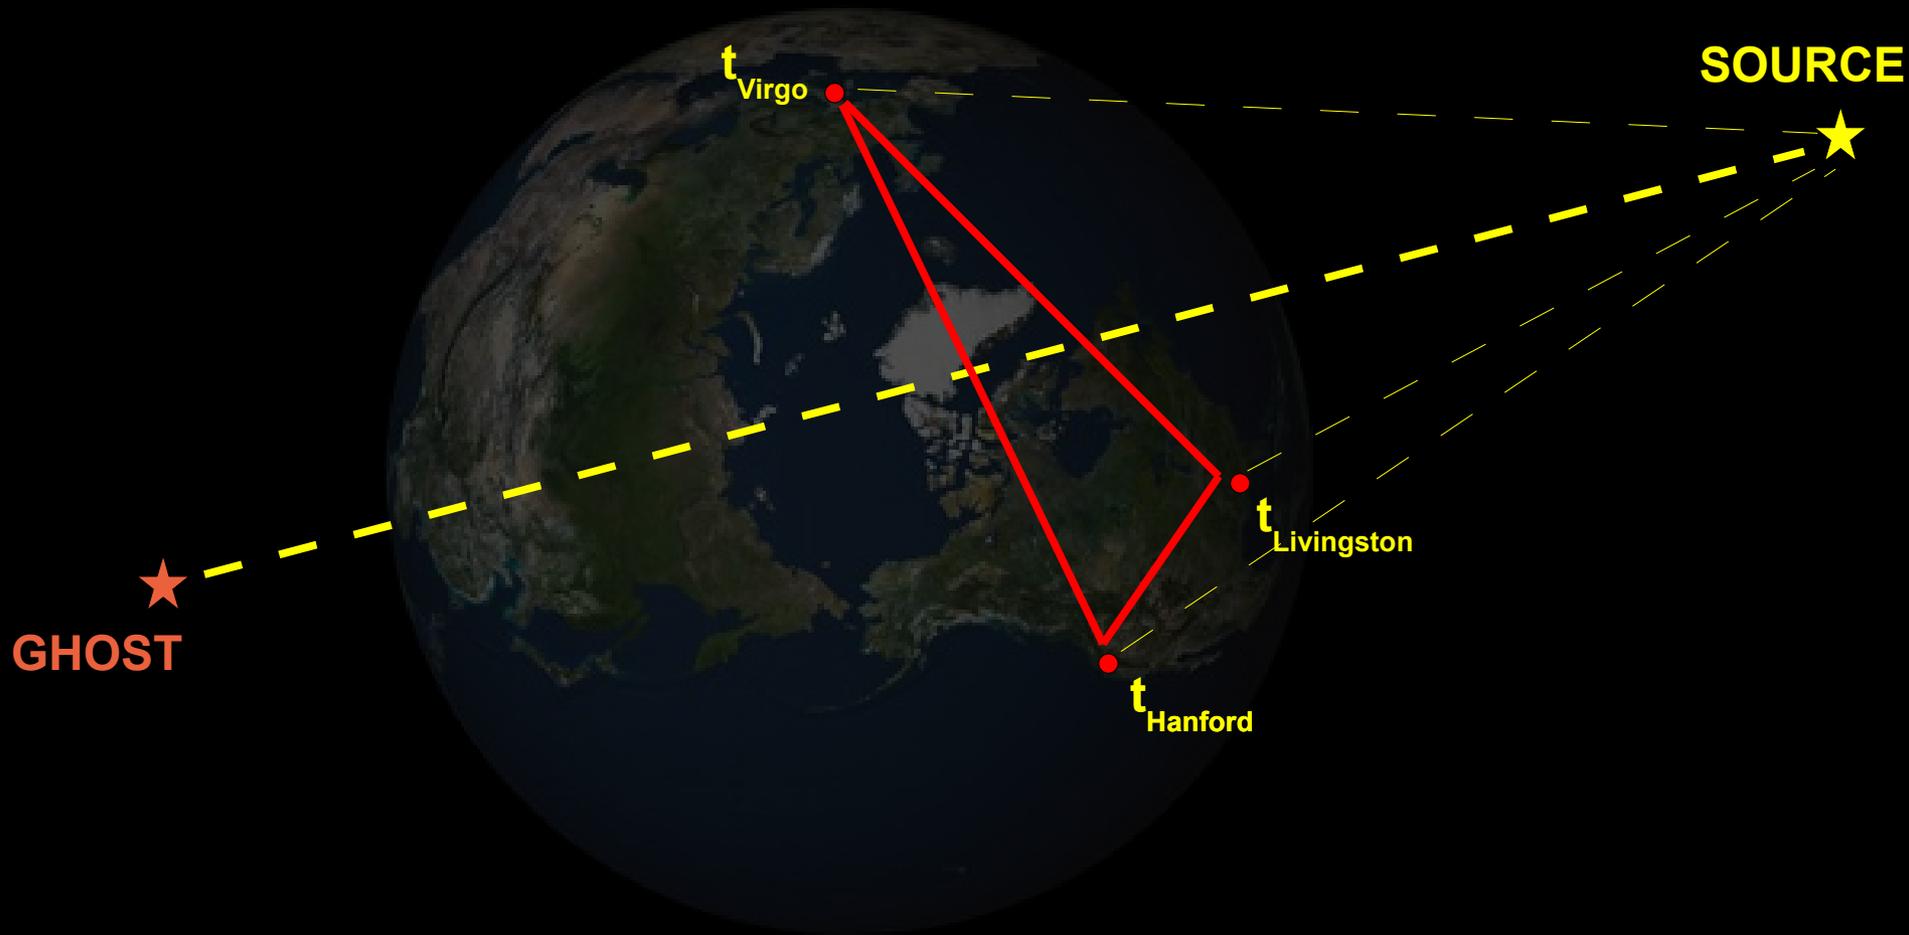

**Hanford (4&2 km)**

# A Network of Detectors

## SOURCE POINTING

- Source location within a few degrees
- Serious candidates follow-up (EM, neutrinos...)

# Analysis Groups

## Compact Binary Coalescence (CBC)

Template searches of well-modeled signals

Free parameters : mass, spin and orbits

## Burst Signals

Short-lived signal (< 1 s)

Unknown or poorly known waveforms

Minimal or no assumption about the waveforms

Searches open to the unexpected

## Continuous Waves

Targeted search (pulsars)

Integrated signal over time and/or over space

Can provide information about the pulsar physics

## Stochastic Background

Early universe GW background

Integrated signal

$$\Omega_w$$

# Analysis Groups

## Compact Binary Coalescence (CBC)

Template searches of well-modeled signals

Free parameters : mass, spin and orbits

## Burst Signals

Short-lived signal ( $< 1$  s)

Unknown or poorly known waveforms

Minimal or no assumption about the waveforms

Searches open to the unexpected

## Continuous Waves

Targeted search (pulsars)

Integrated signal over time and/or over space

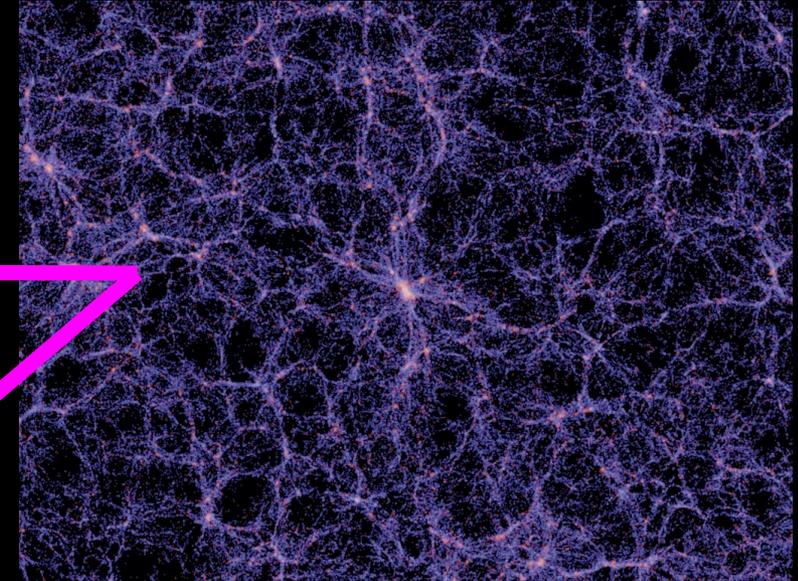

Can provide information about the pulsar physics

## Stochastic Background

Early universe GW background

Integrated signal

$$\Omega_w$$

GW produced by cosmic string

# Cosmic Strings : Sources of Gravitational Waves

## **Cosmic strings :**

Linear topological defects formed at a symmetry breaking phase transition in the early universe

Since the early 80's, we know that oscillating loops can generate a potentially observable GW background (Zel'dovich, Vilenkin, Kibble...).

At the time of formation, the strings have the shape of Brownian trajectories

Tension in convoluted strings

Oscillations

Oscillations damped by : **GW radiation**

The strings gradually straighten out

The network of cosmic strings is usually parameterized by the string tension  $\mu$  (or  $G\mu$ ) and the reconnection probability  $p$

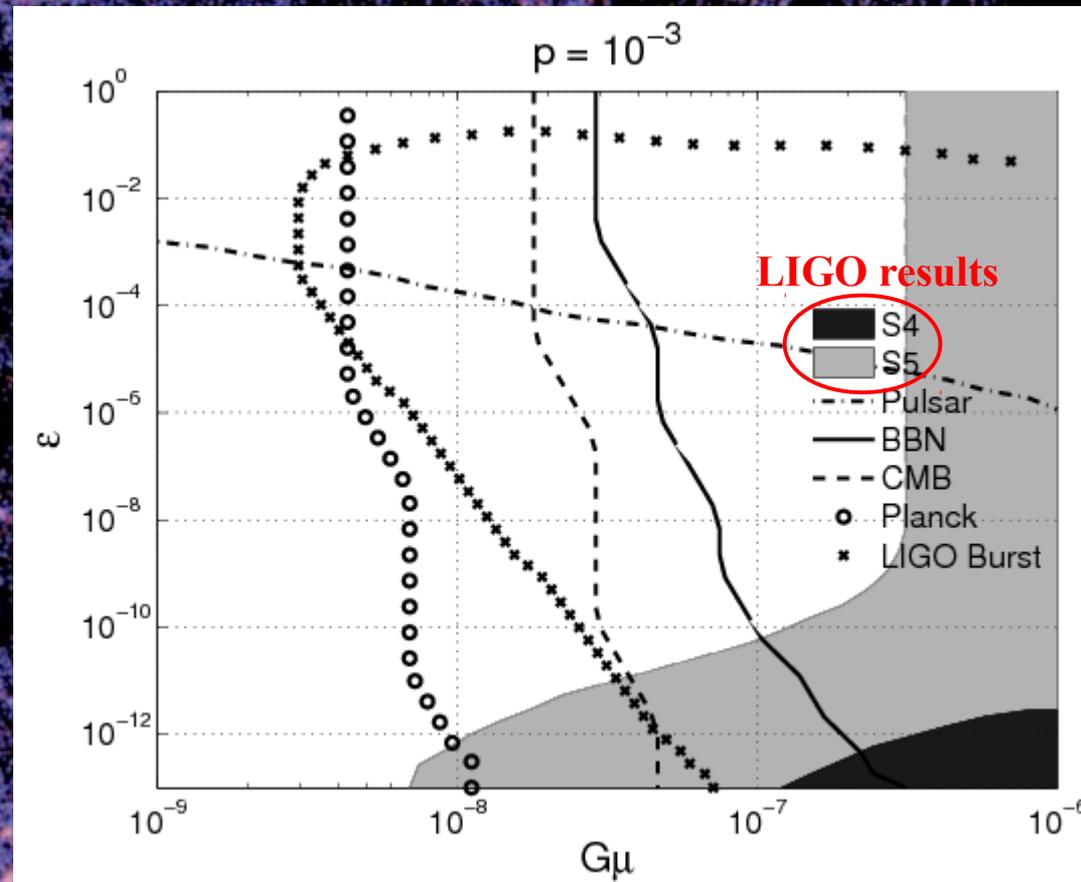

# Cosmic Strings : Sources of Gravitational Waves

**Mechanism : string loops which decay by radiating gravitationally.**

**Additional parameter  $\varepsilon$  : loop size parameter**

**Constraining the parameter space  $(G\mu, \varepsilon, p) =$  Constraining the loop formation models**

Results from the  
stochastic  
background  
analysis  
(indirect bounds)

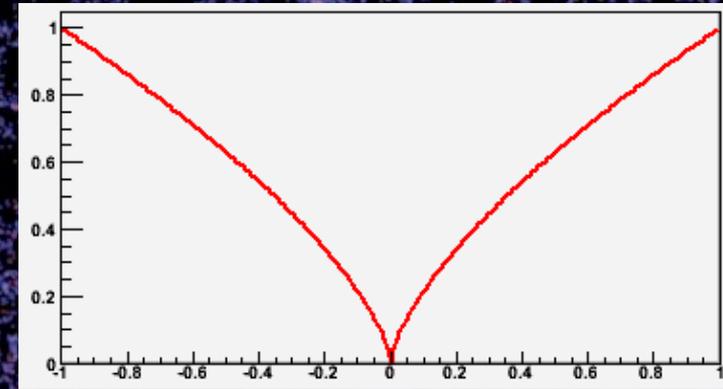

The LSC & the Virgo Collaboration, Nature 460, 990

# Cosmic Strings Cusps

The GW background generated by cosmic strings has been assumed nearly gaussian for a long time  
In 2000-2001 T. Damour and A. Vilenkin suggest that :

"The GW background from strings is strongly non gaussian and includes sharp GW bursts emanating from cosmic string cusps"

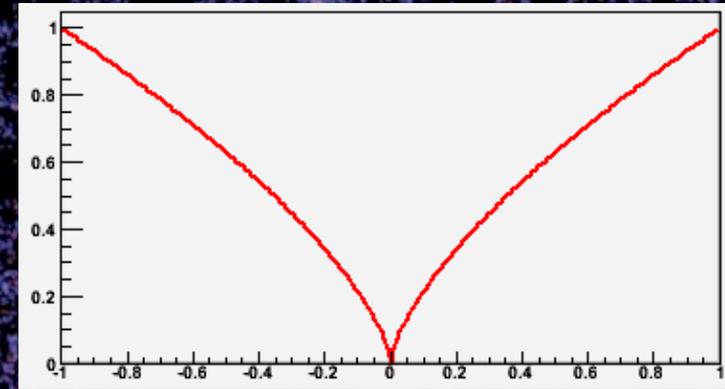

Cusp shape

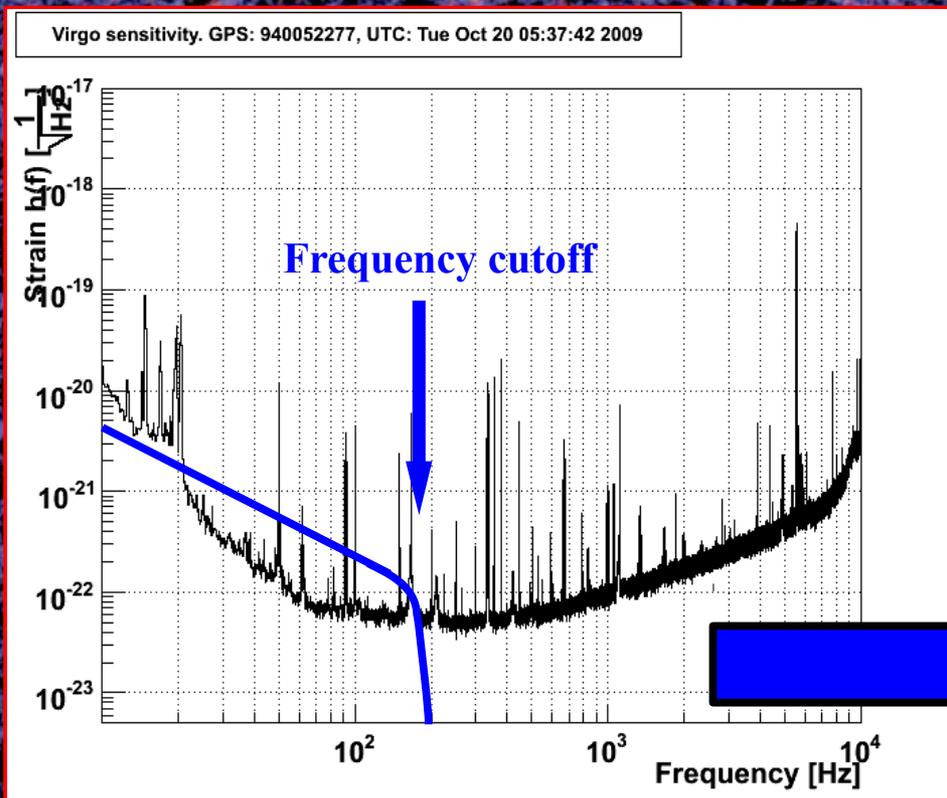

# Cosmic Strings Cusps

The GW background generated by cosmic strings has been assumed nearly gaussian for a long time  
 In 2000-2001 T. Damour and A. Vilenkin suggest that :

"The GW background from strings is strongly non gaussian and includes sharp GW bursts emanating from cosmic string cusps"

Cusp shape

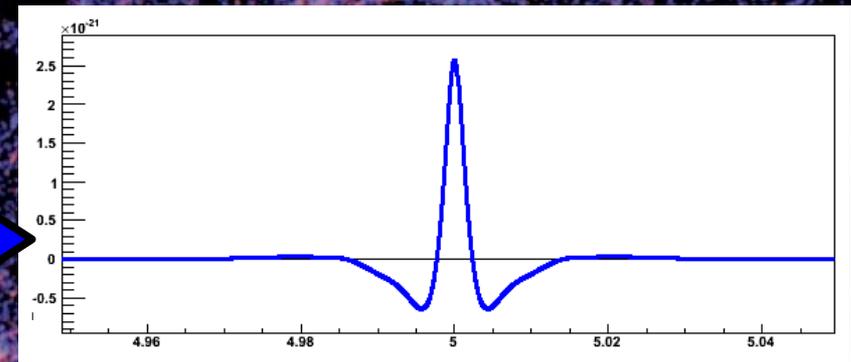

$$A = \frac{G \mu L^{2/3}}{r}$$

Scaled amplitude

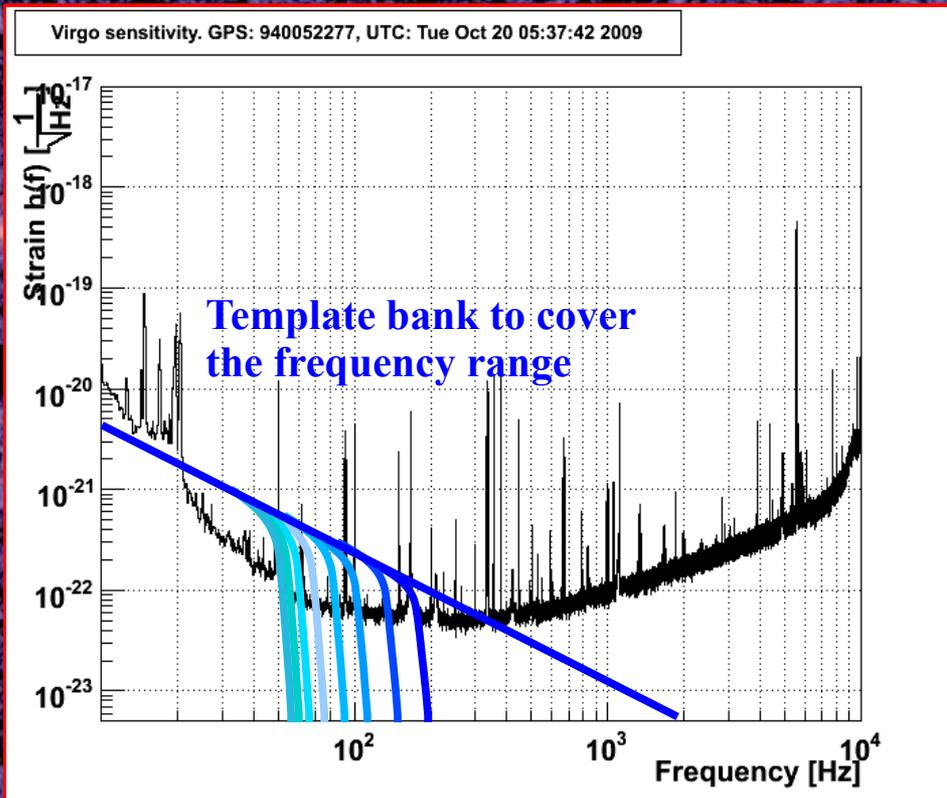

$$f_{cutoff} = \frac{2}{\theta^3 L}$$

Free parameter of the search

Time Signal ~ 10 ms

# Cosmic Strings : The Trigger Production

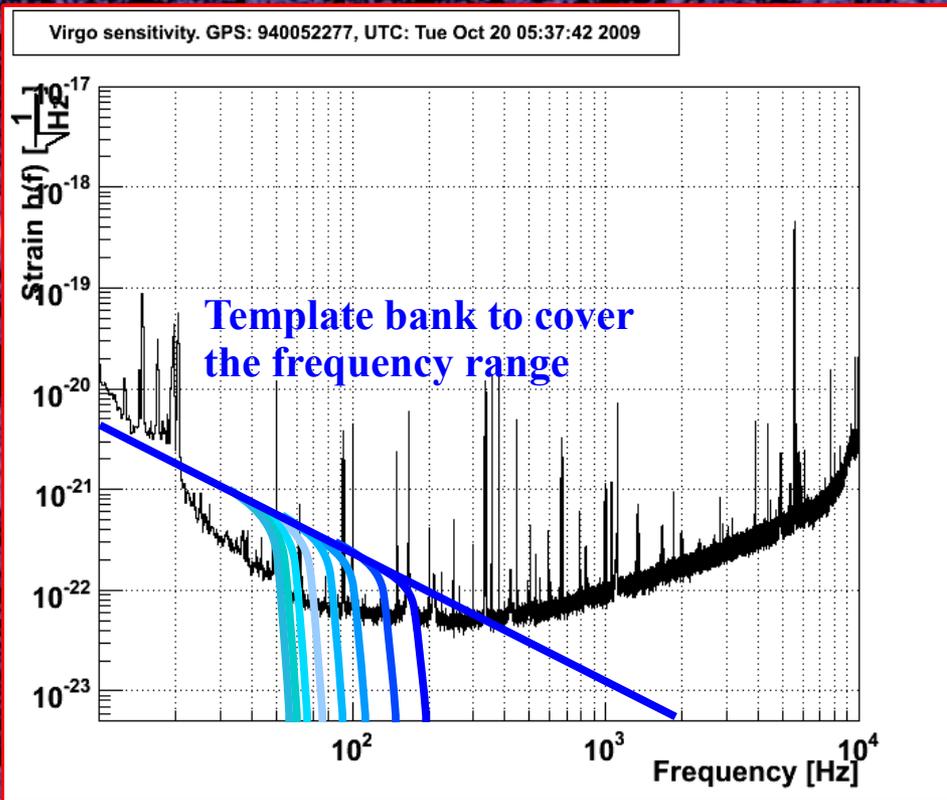

## Match-filtered Search

$\sim 20$  templates to cover the frequency range :  
 $f_{\text{cutoff}}$  : 75 to 2048 Hz

## LIGO S4 Analysis (2005 data) :

Triple coincidence between Hanford (H1&H2)  
and Livingston (L1)

# Cosmic Strings : The Trigger Production

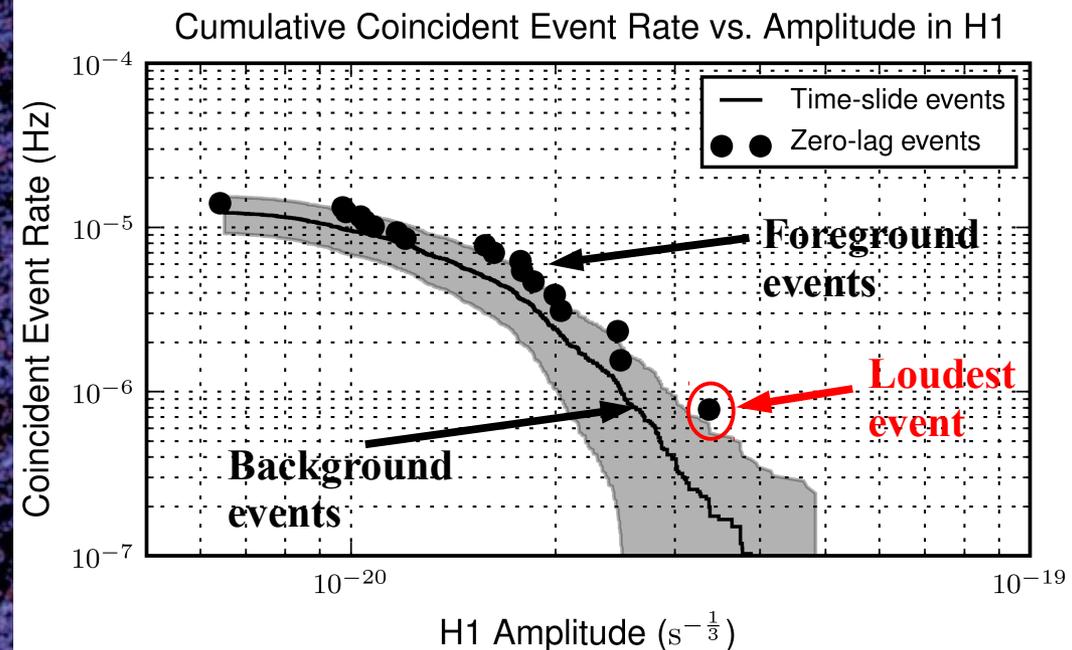

## Match-filtered Search

~ 20 templates to cover the frequency range :  
 $f_{\text{cutoff}}$  : 75 to 2048 Hz

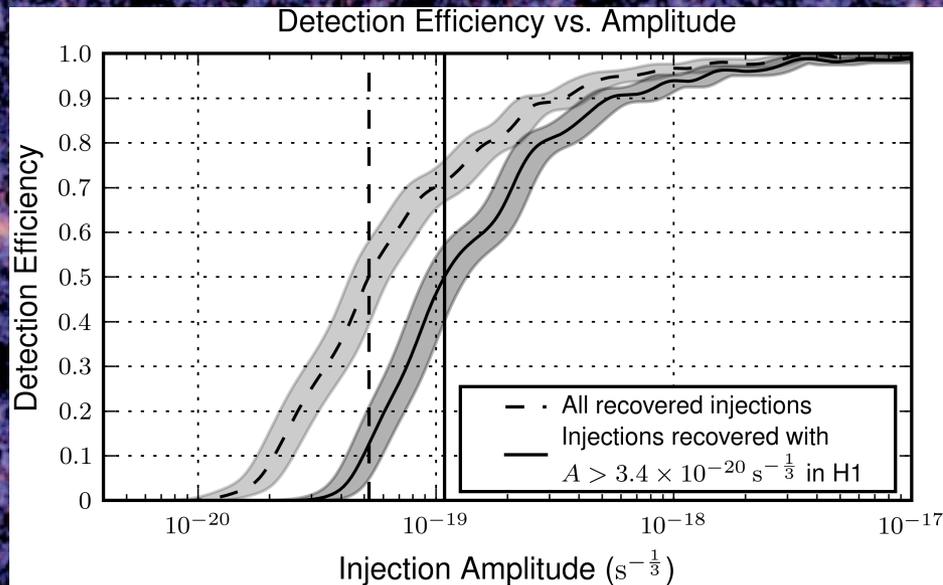

## LIGO S4 Analysis (2005 data) :

Triple coincidence between Hanford (H1&H2)  
 and Livingston (L1)

# Cosmic Strings : Efficiency and Upper Limits

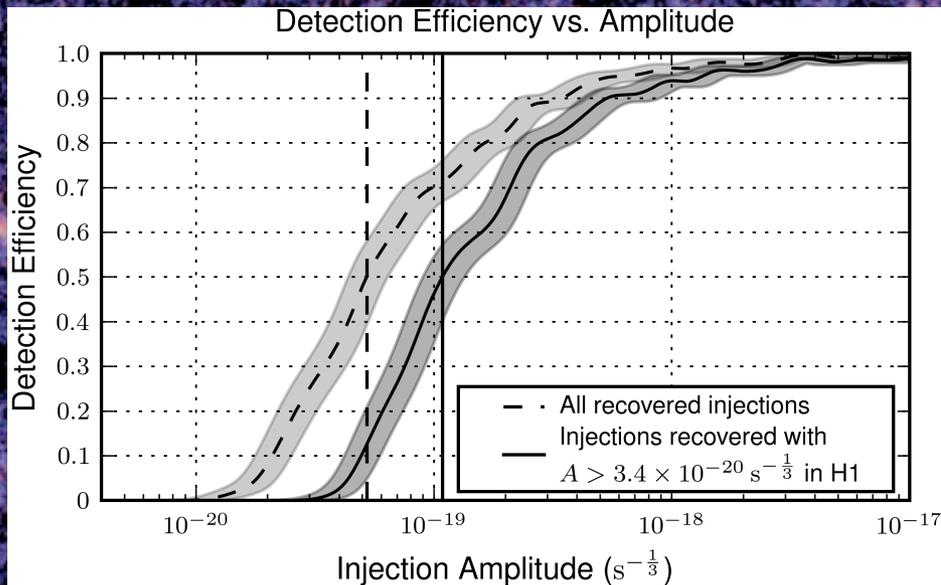

Efficiency determined with a set of  $\sim 7000$  fake signal injections of random amplitudes,  $f_{\text{cutoff}}$  and sky positions

**Effective rate :**

$$\gamma(G\mu, \varepsilon, p) = \int_0^{\infty} \epsilon(A) \frac{dR(A; G\mu, \varepsilon, p)}{dA} dA$$

$R$  : production rate

# Cosmic Strings : Efficiency and Upper Limits

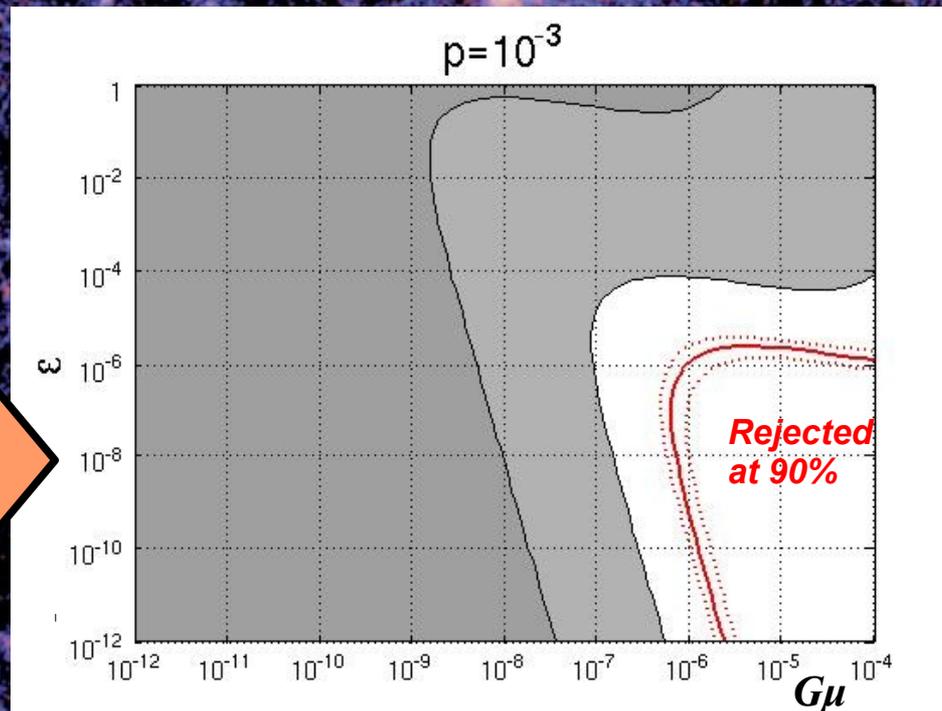

Efficiency determined with a set of  $\sim 7000$  fake signal injections of random amplitudes,  $f_{\text{cutoff}}$  and sky positions

**Effective rate :**

$$\gamma(G\mu, \varepsilon, p) = \int_0^\infty \epsilon(A) \frac{dR(A; G\mu, \varepsilon, p)}{dA} dA$$

$R$  : production rate

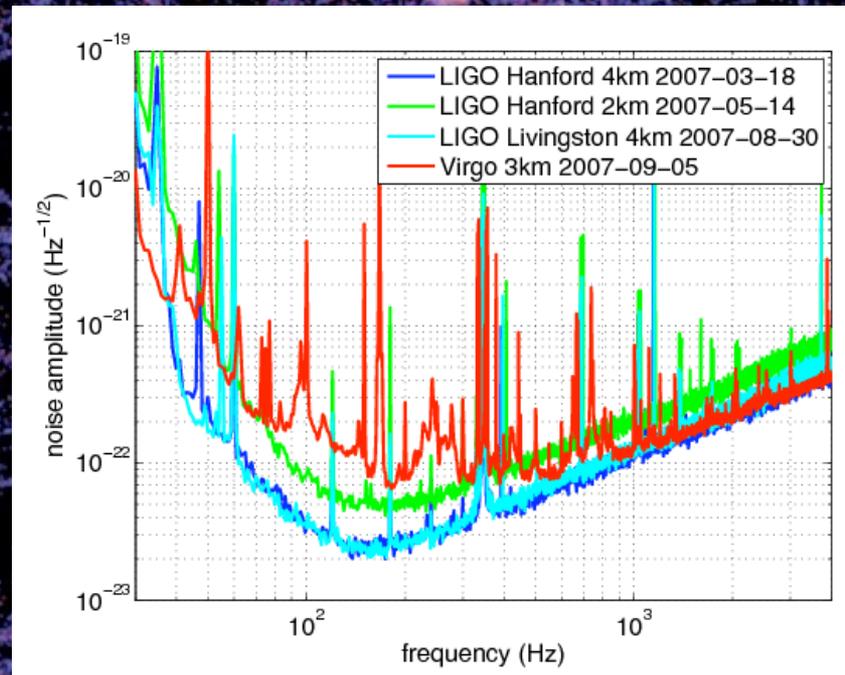

Upper limits

# Cosmic Strings : The Upcoming Analysis

LIGO S5 data + Virgo VSR1 data (2007)

## Main features :

- 1) Better sensitivity ( $\sim$  factor 2)
- 2) Longer live-time
  - longer run
  - all combinations of detectors (double, triple, quadruple)
- 3) More refined analysis

# Cosmic Strings : A Bayesian Approach

If an event is characterized by a set of variables  $\vec{x}$  the following likelihood ratio can be used :

$$R(\vec{x}) = \frac{P(\vec{x} | T \in S)}{P(\vec{x} | T \in B)} \longrightarrow \text{Can be used to rank the foreground events}$$

$S$  : is a population of fake signal injections

$B$  : is a population of background events

**Training samples**

# Cosmic Strings : A Bayesian Approach

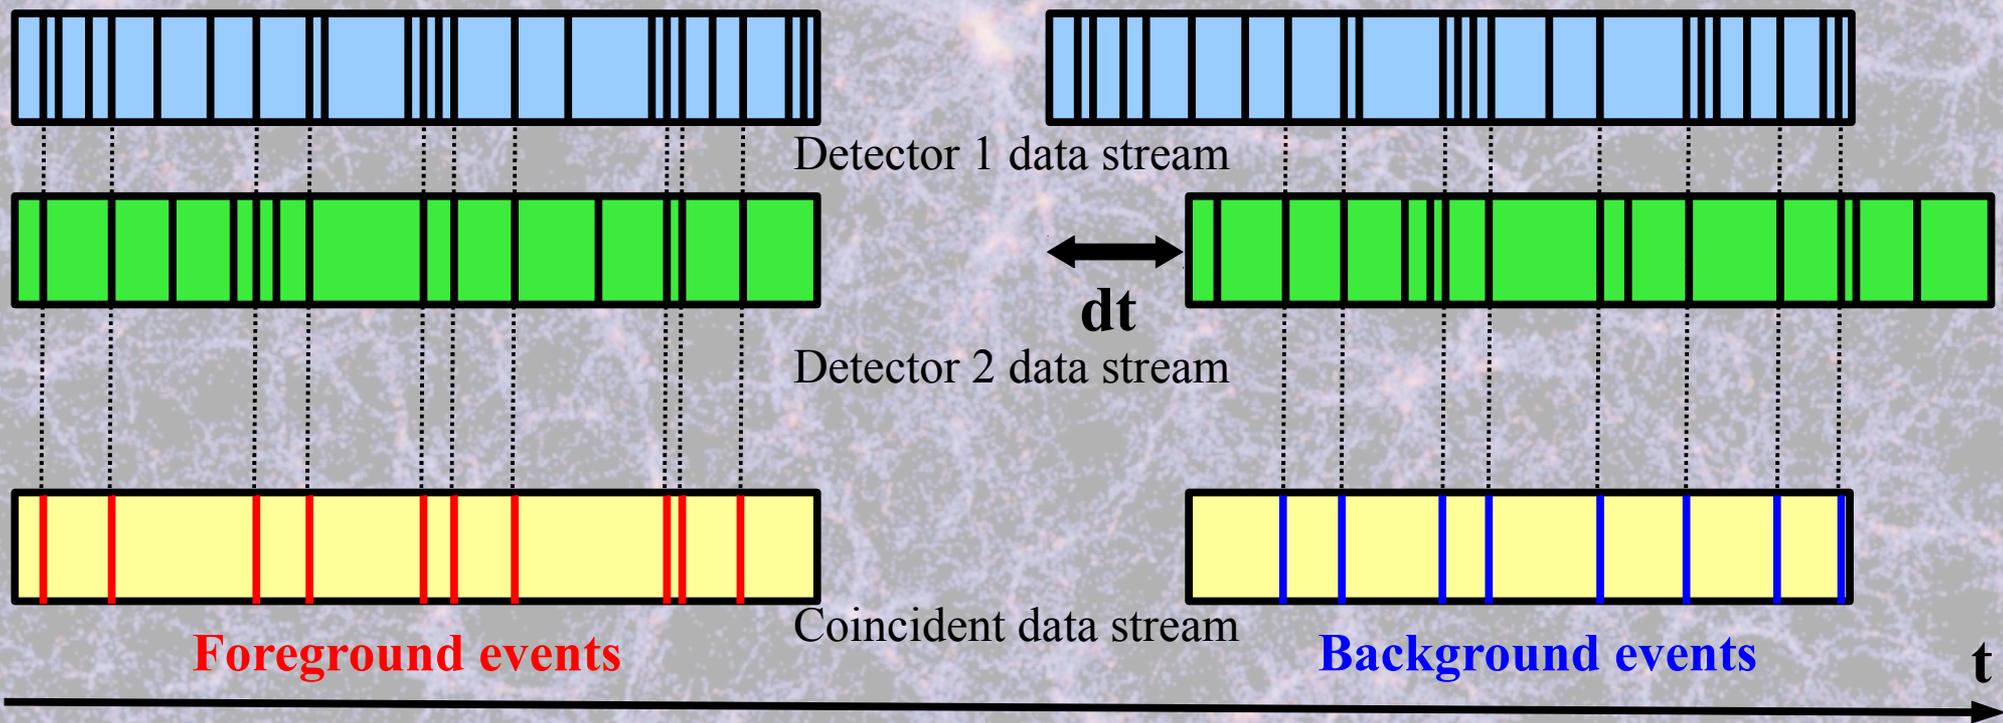

If an event is characterized by a set of variables  $\vec{x}$  the following likelihood ratio can be used :

$$R(\vec{x}) = \frac{P(\vec{x} | T \in S)}{P(\vec{x} | T \in B)} \quad \longrightarrow \quad \text{Can be used to rank the foreground events}$$

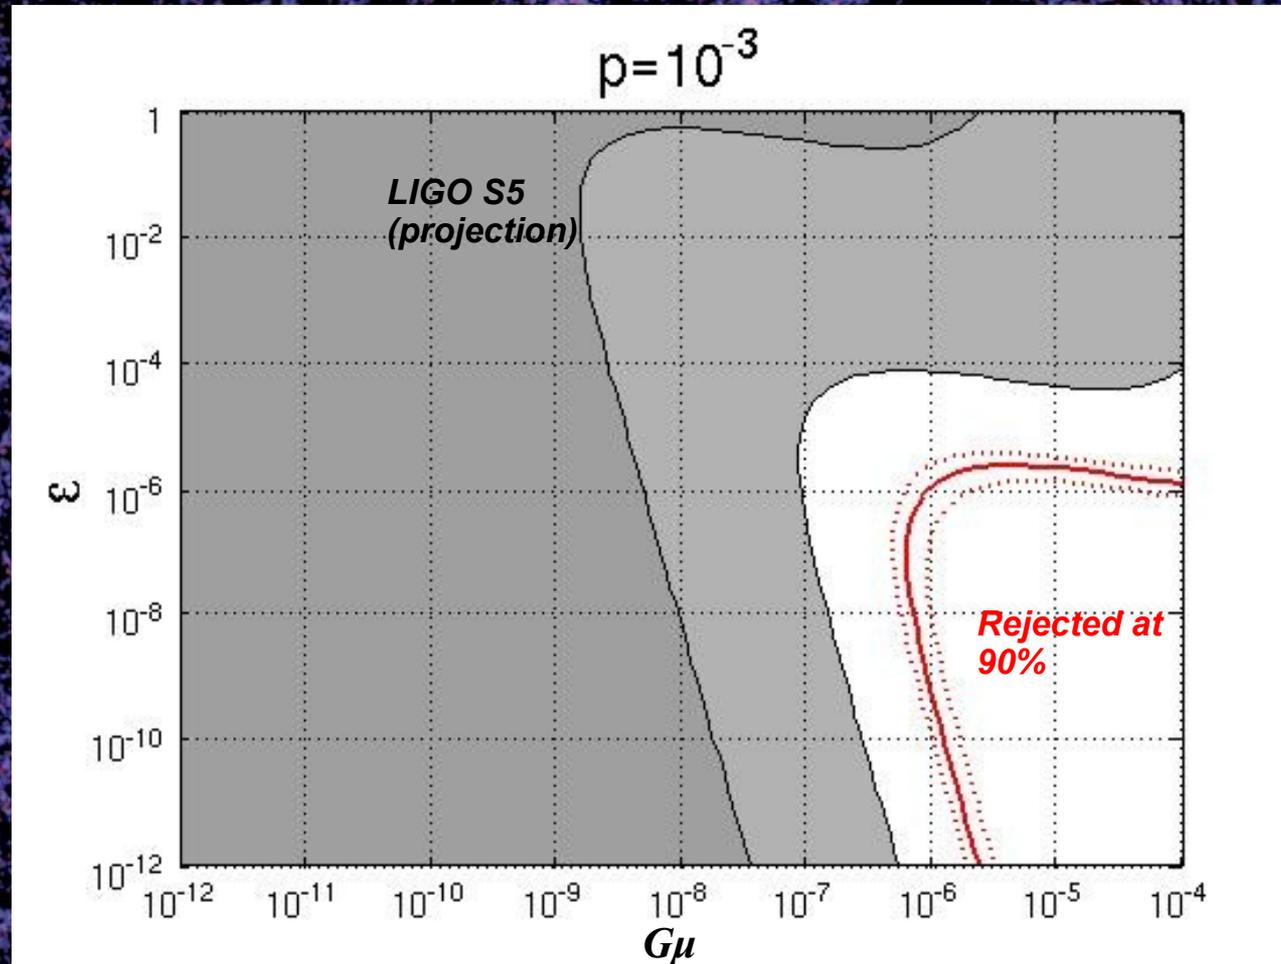

$S$  : is a population of fake signal injections

$B$  : is a population of background events

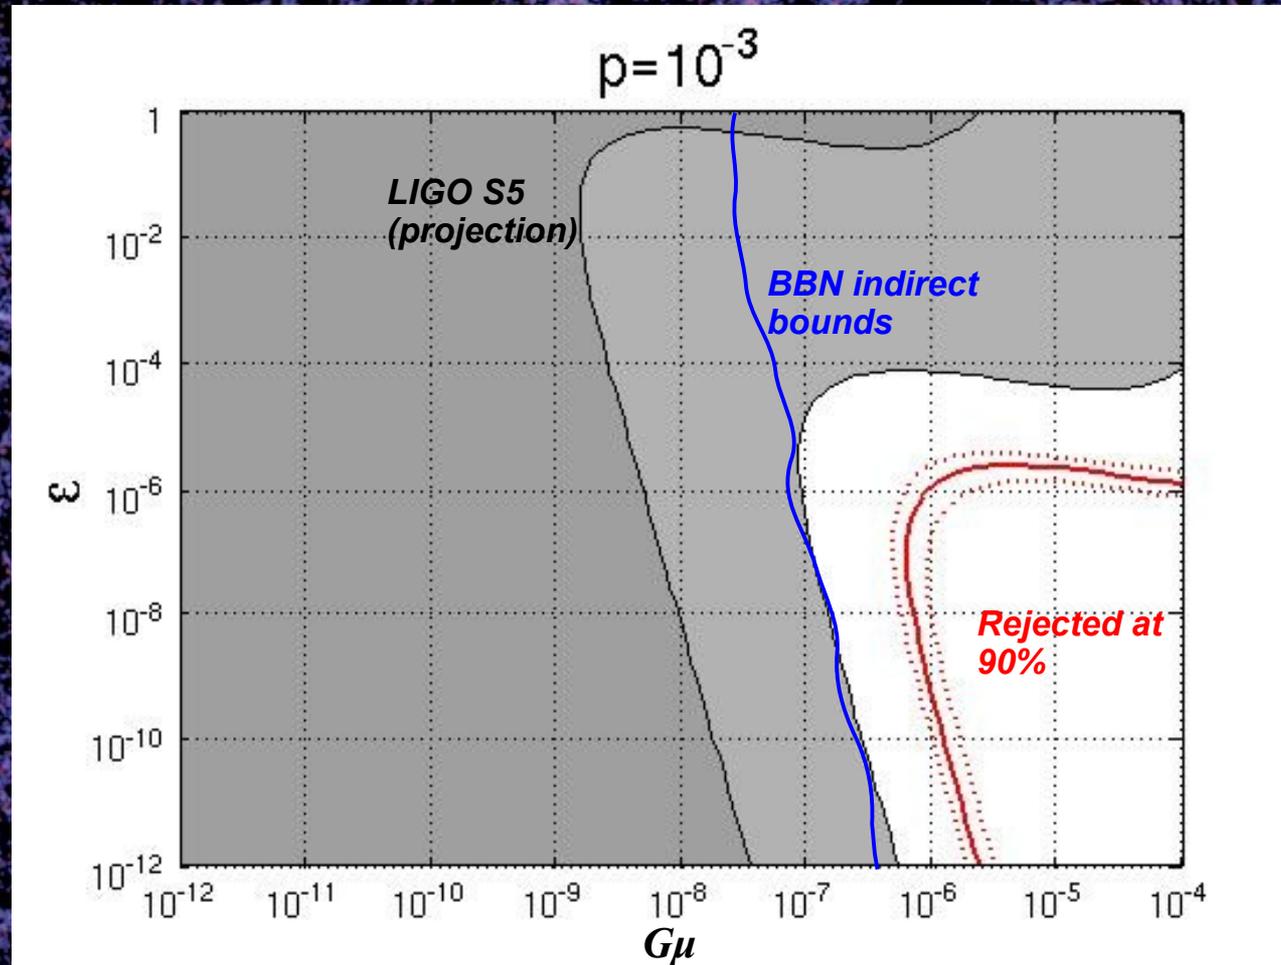

**Training samples**

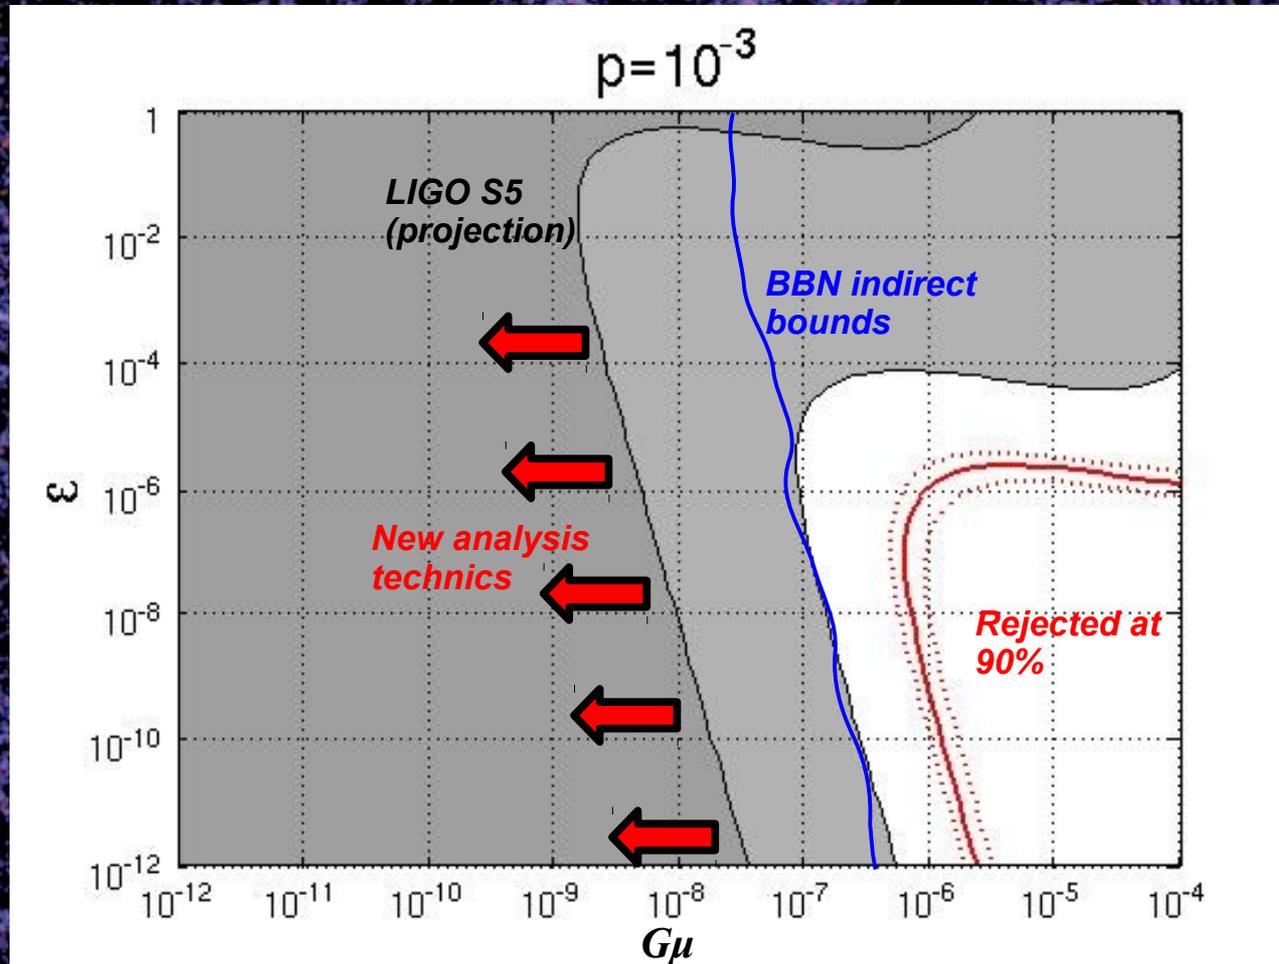

# Cosmic Strings : Promising Upper Limits

# Cosmic Strings : Promising Upper Limits

# Cosmic Strings : Promising Upper Limits

**The upcoming analysis should put significant constraints on the cosmic string parameter space**

# Conclusions

- **Many cosmological models can originate from the cosmic strings (the galaxy formation, the matter distribution in the universe...). So it is important to constrain the free parameters of the theory**
- **The search for gravitational waves produced by cosmic string cusps is an efficient way of directly constraining the string parameters**
- **The upcoming S5/VSR1 analysis should be able to give the most competitive limits**
- **The data of S6/VSR2 remain to be analyzed**
