

Présentation rapide de CIGALE

Atelier base de données POLLUX et données de spectroscopie en astrophysique

Yannick Roehlly

Montpellier, le 15 novembre 2022

Laboratoire d'Astrophysique de Marseille (CNRS - AMU - CNES)

Introduction

- Jeu de spectres théoriques de galaxies

- Jeu de spectres théoriques de galaxies
- Catalogue d'observations photométriques de galaxies

- Jeu de spectres théoriques de galaxies
- Catalogue d'observations photométriques de galaxies
- Calcul de la photométrie théorique dans les mêmes bandes

- Jeu de spectres théoriques de galaxies
- Catalogue d'observations photométriques de galaxies
- Calcul de la photométrie théorique dans les mêmes bandes
- Comparaison et analyse statistique pour *inférer* des paramètres physiques

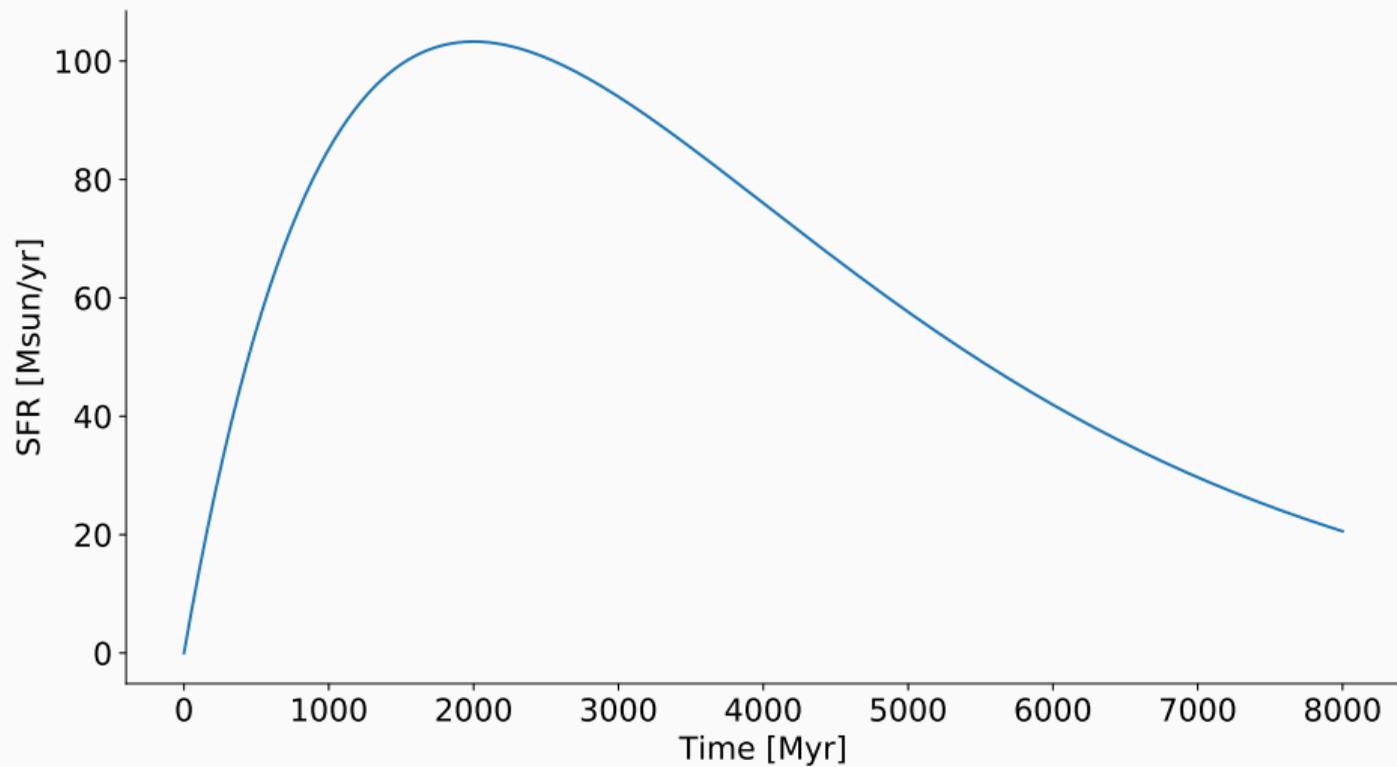

- Construction des spectres théoriques à partir de modules (SFH, SSP, atténuation, *etc.*) \neq jeu de *templates*

- Construction des spectres théoriques à partir de modules (SFH, SSP, atténuation, etc.) \neq jeu de *templates*
- Respect de l'équilibre énergétique (*energy balance*)

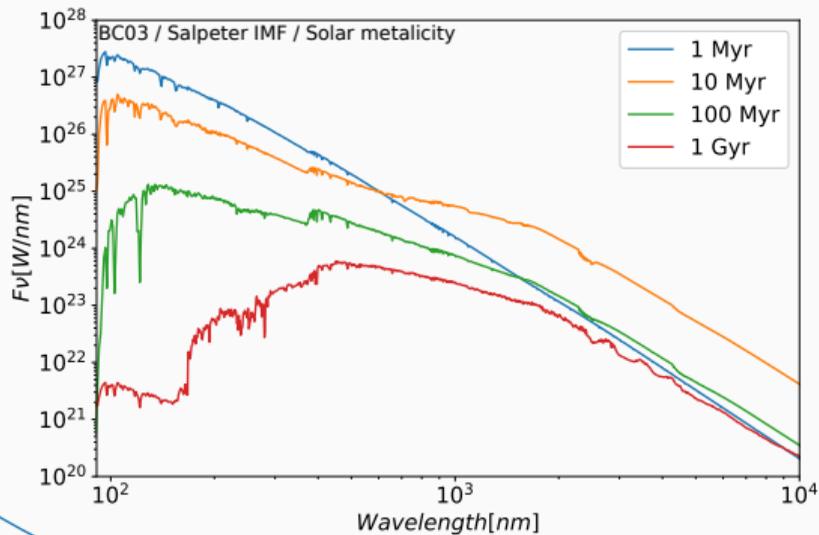

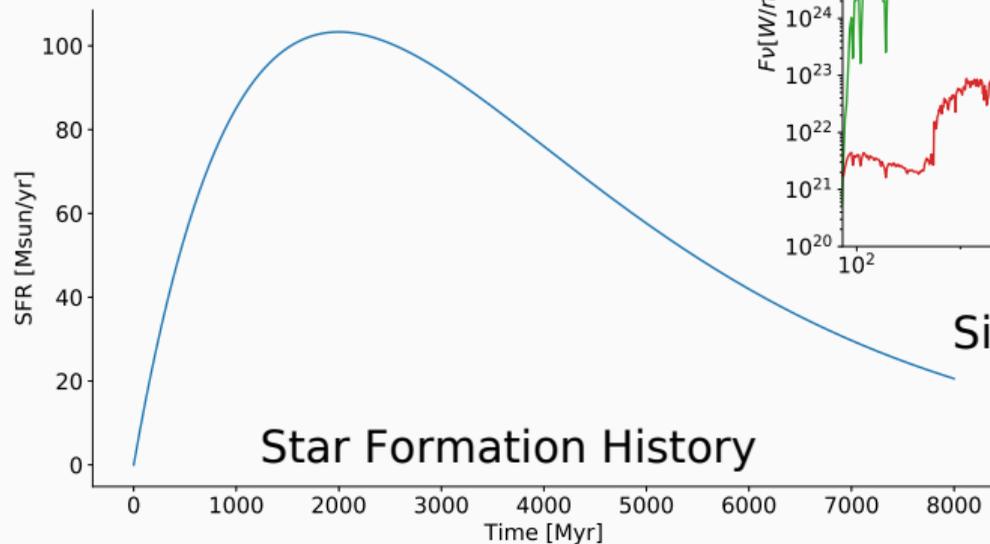

- Construction des spectres théoriques à partir de modules (SFH, SSP, atténuation, *etc.*) ≠ jeu de *templates*
- Respect de l'équilibre énergétique (*energy balance*)
- Code Python organisé pour faciliter l'ajout de nouveaux modules

Exemple de création de SED

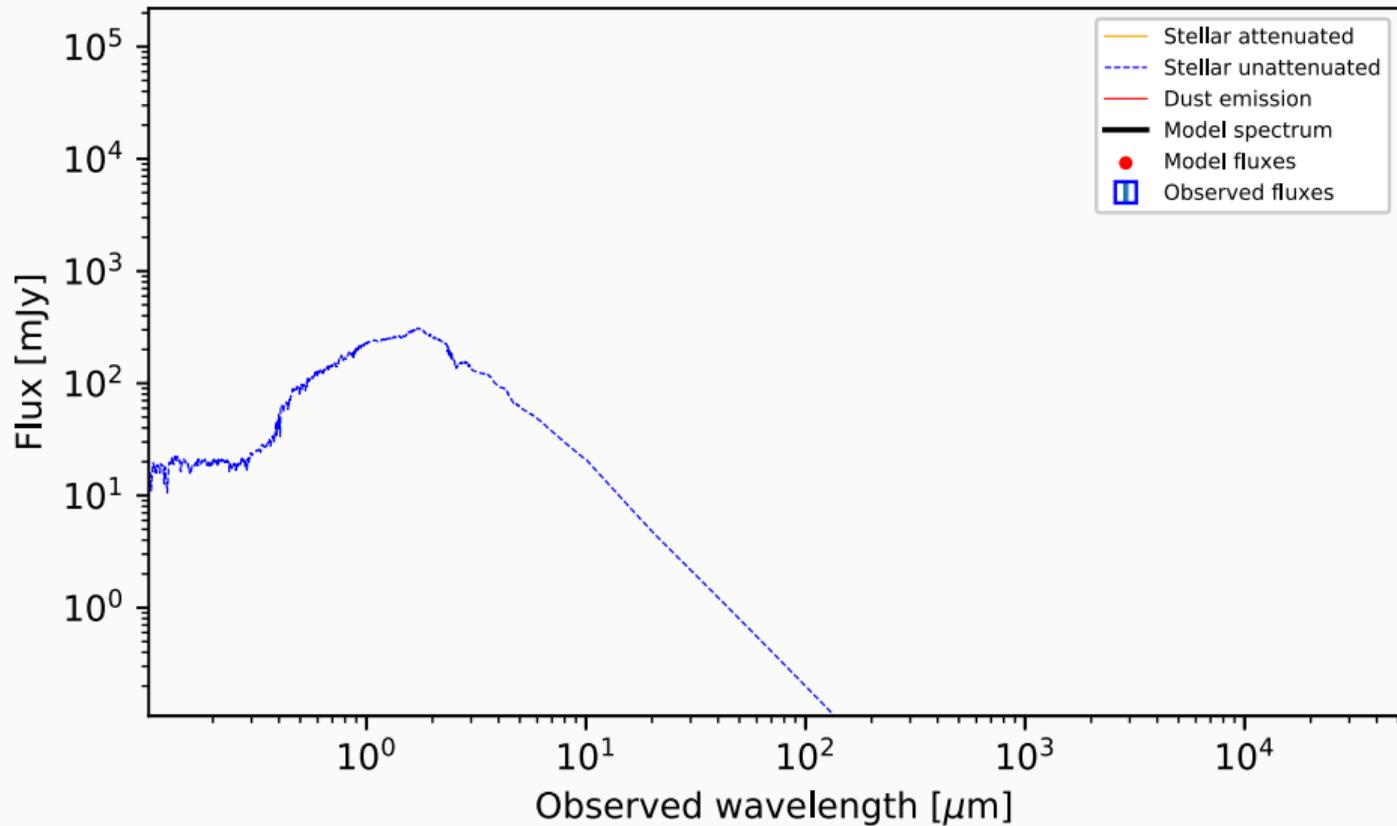

Histoire de formation stellaire (SFH)

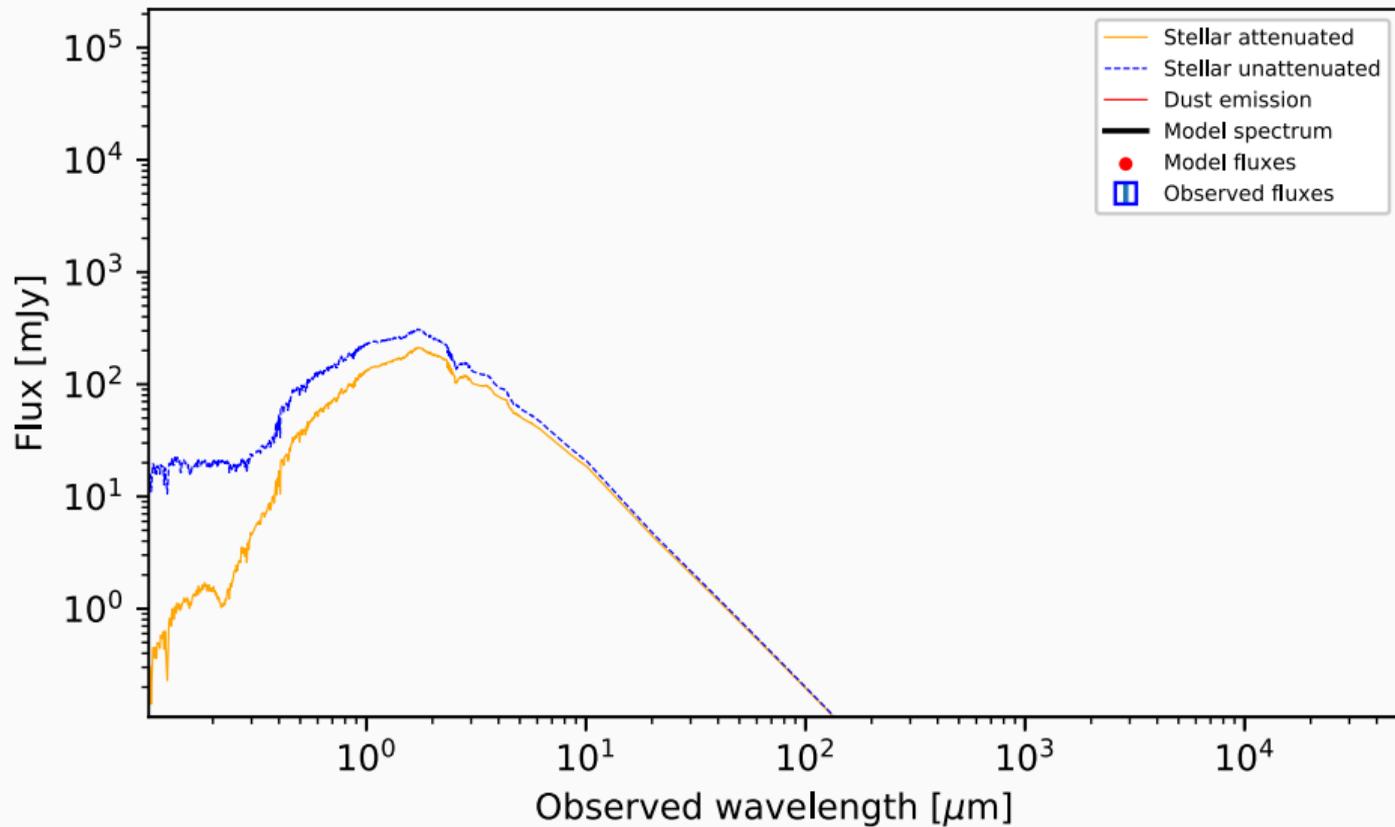

Convolution avec un modèle de population stellaire (SSP)

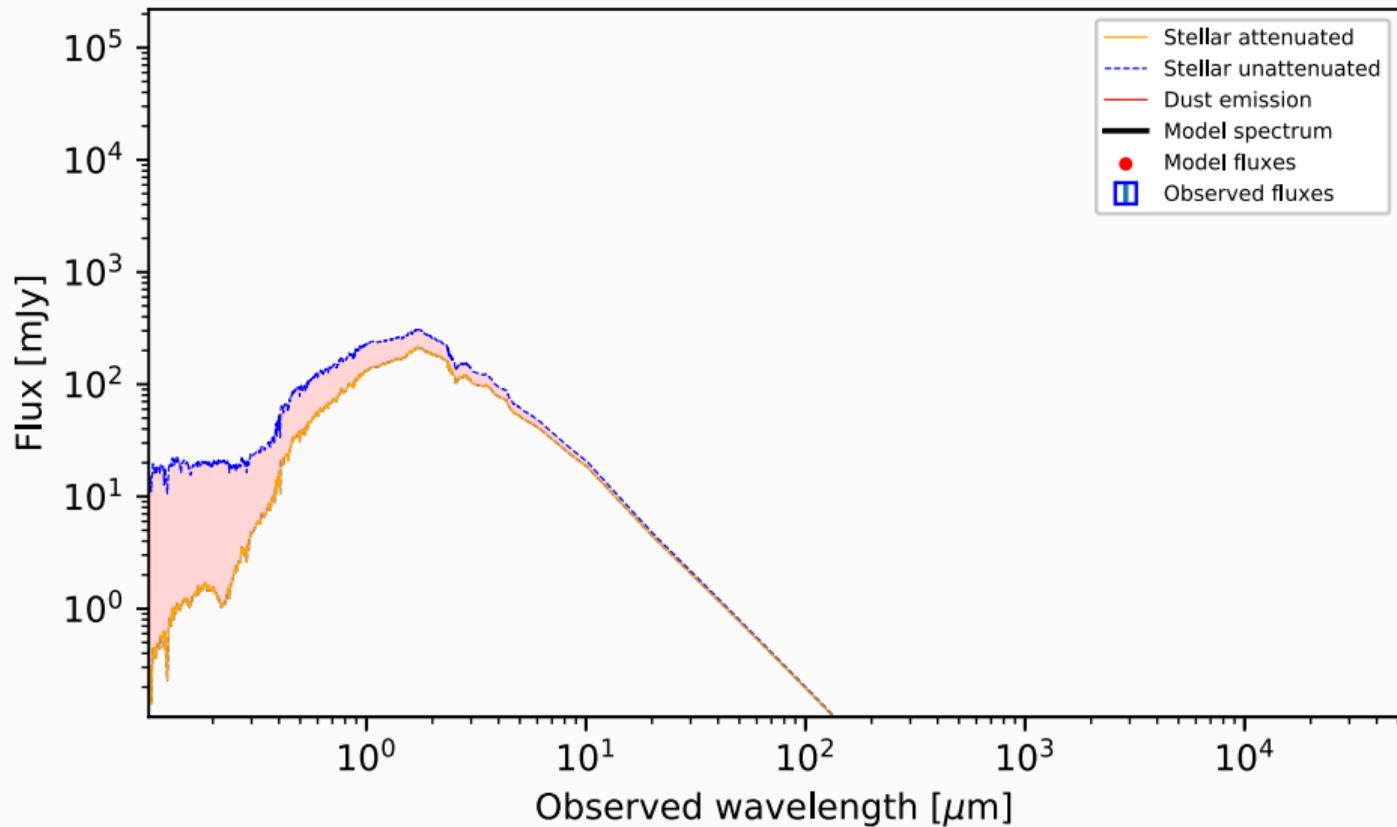

Émission stellaire

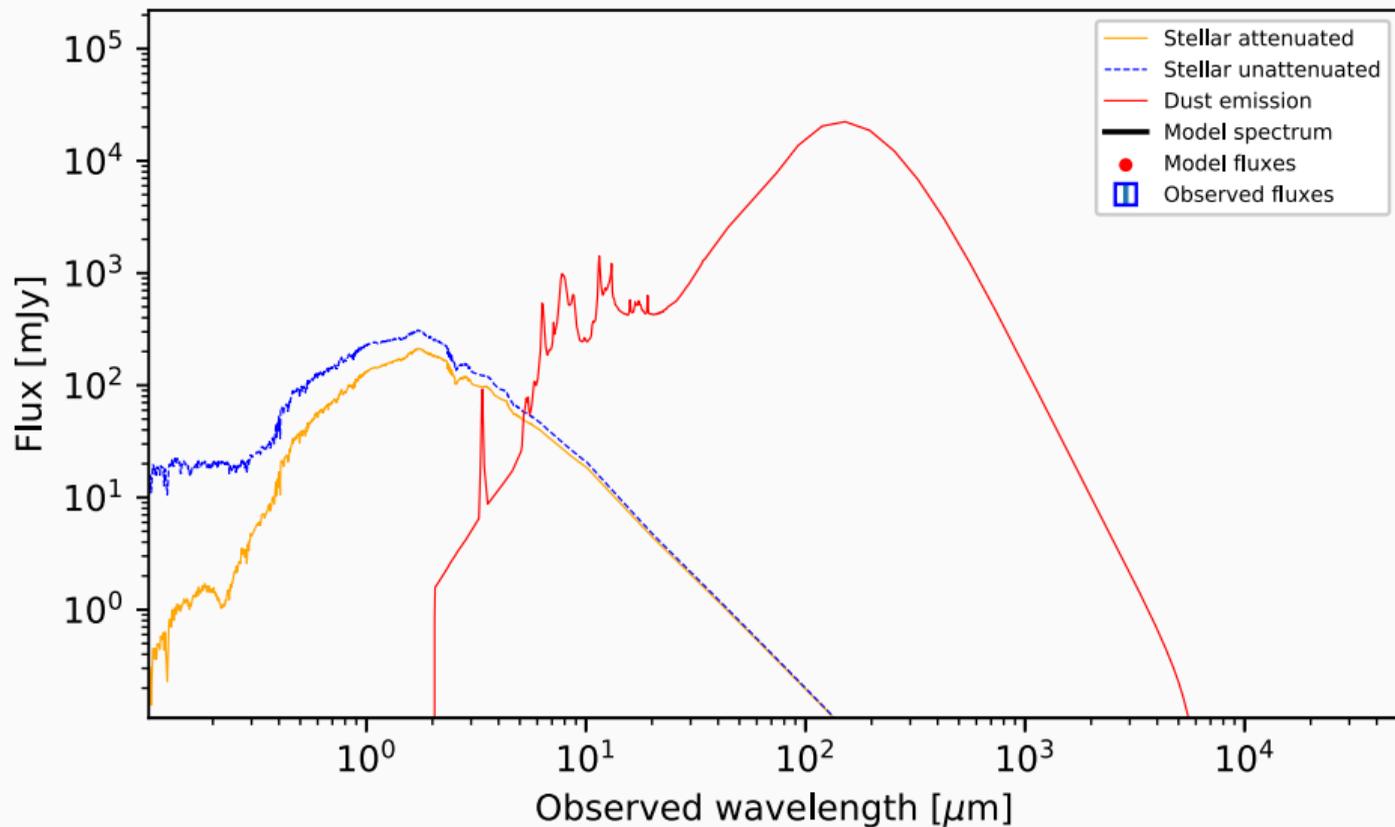

Attenuation

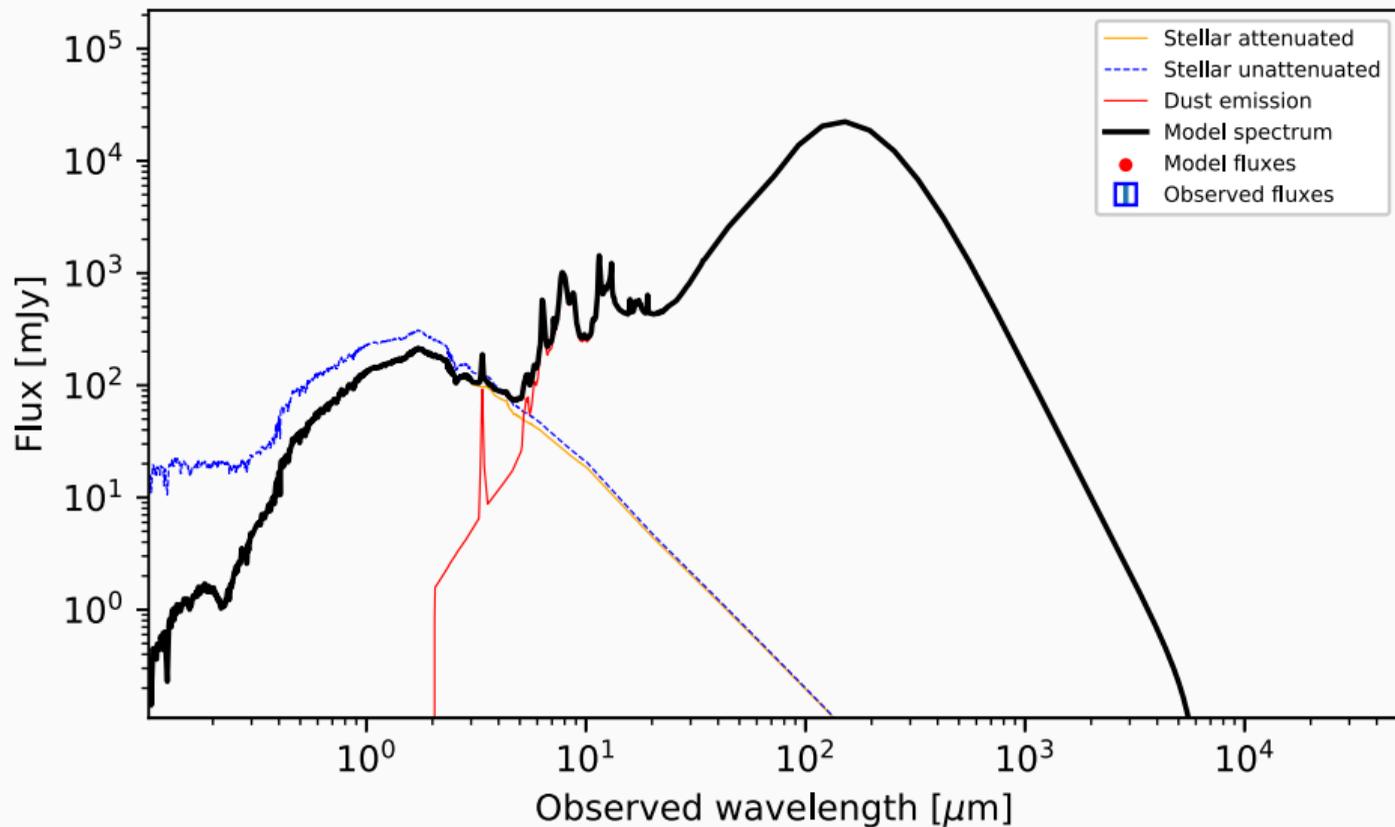

Énergie atténuée

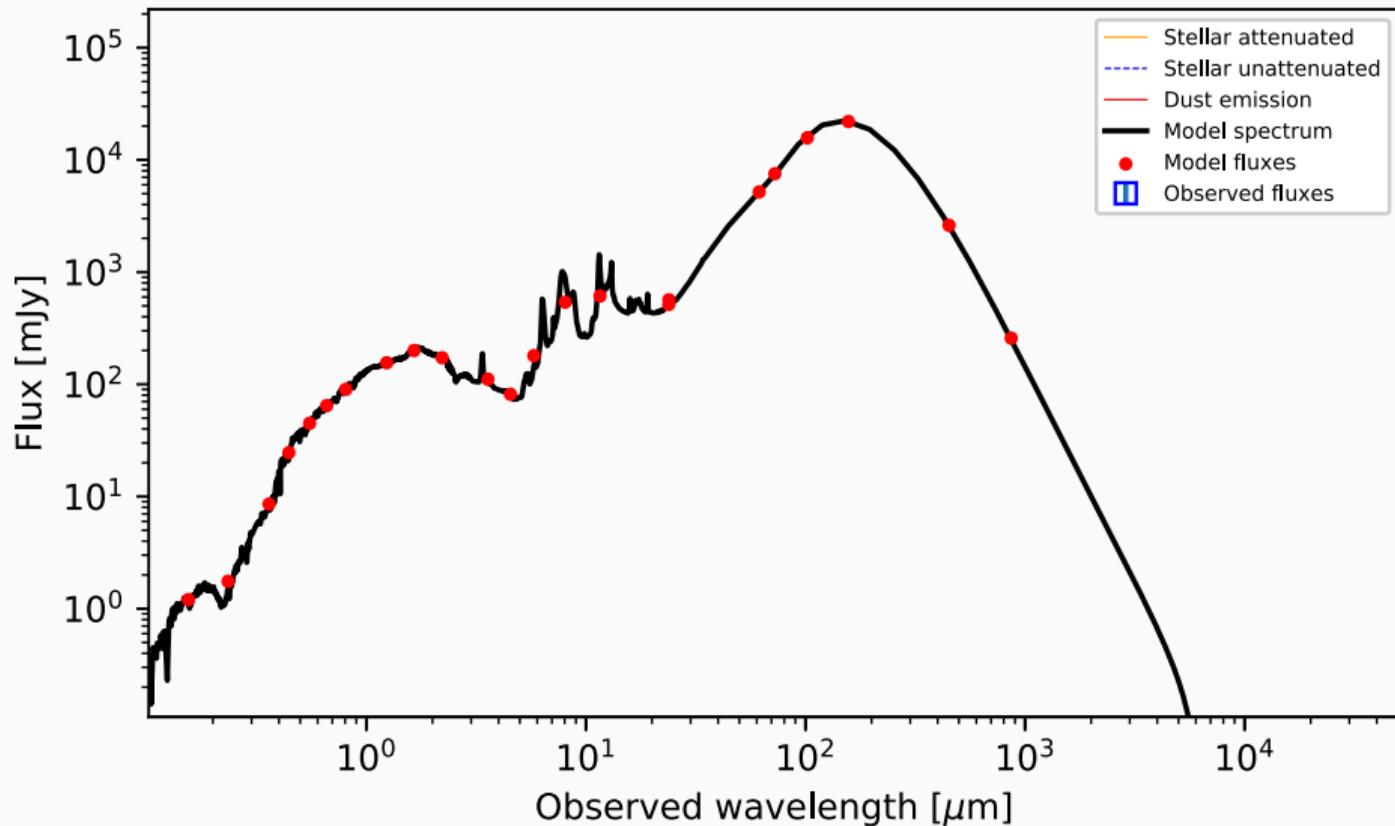

Ré-émission par les poussières

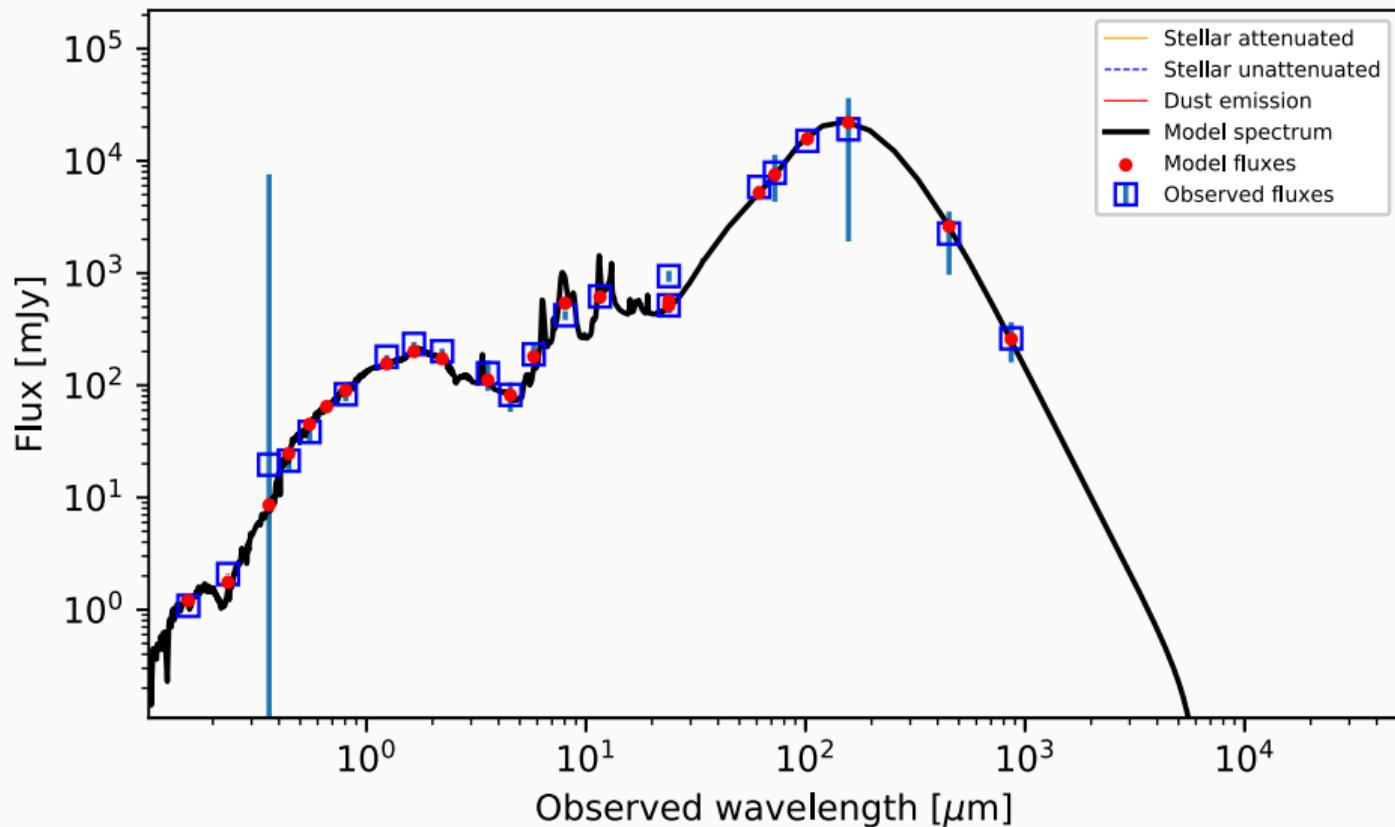

Spectre final

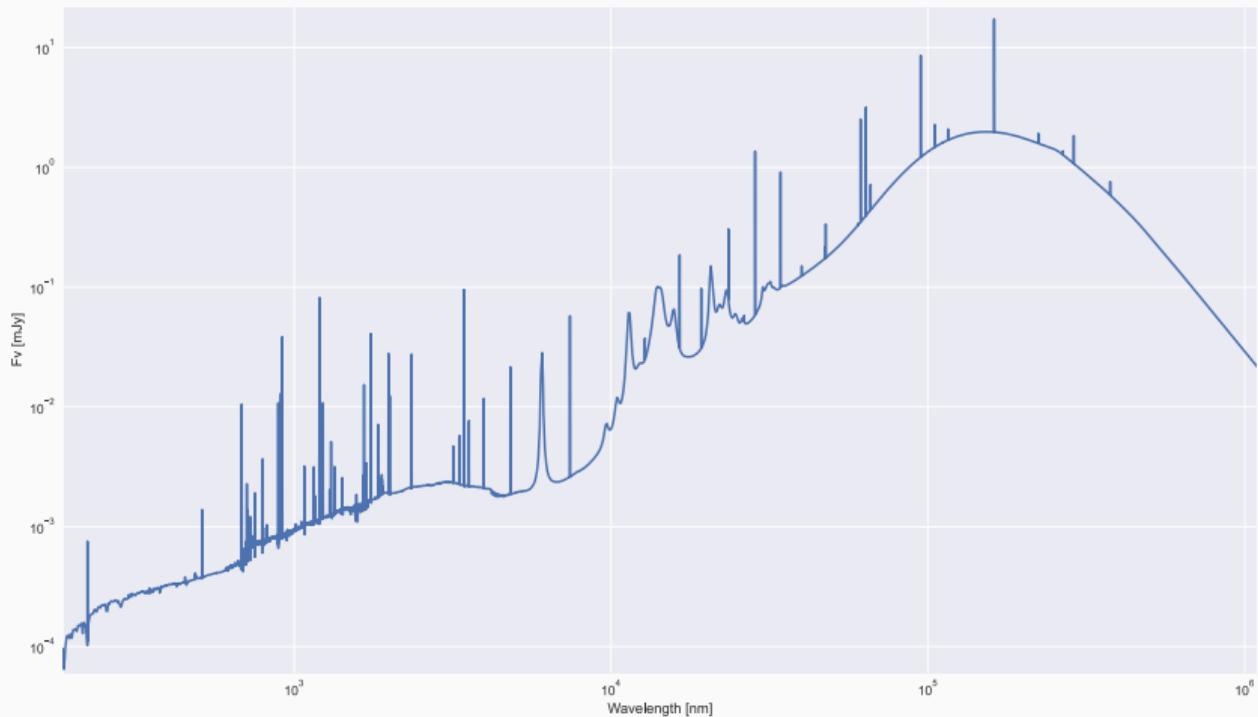

Photométrie du modèle

Comparaison à l'observation

Note: nous avons aussi l'émission nébulaire

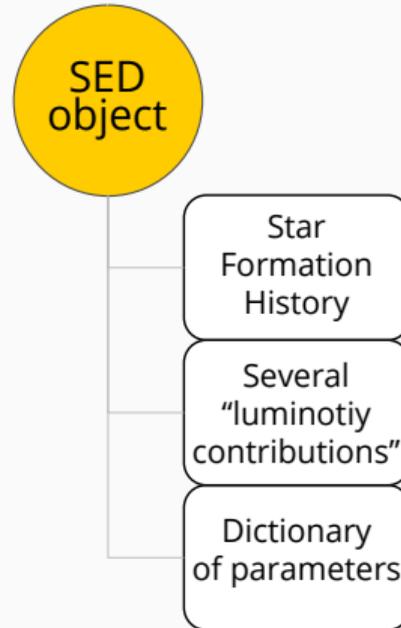

Exemple de spectre théorique ajusté sur des données COSMOS

Modularité de CIGALE

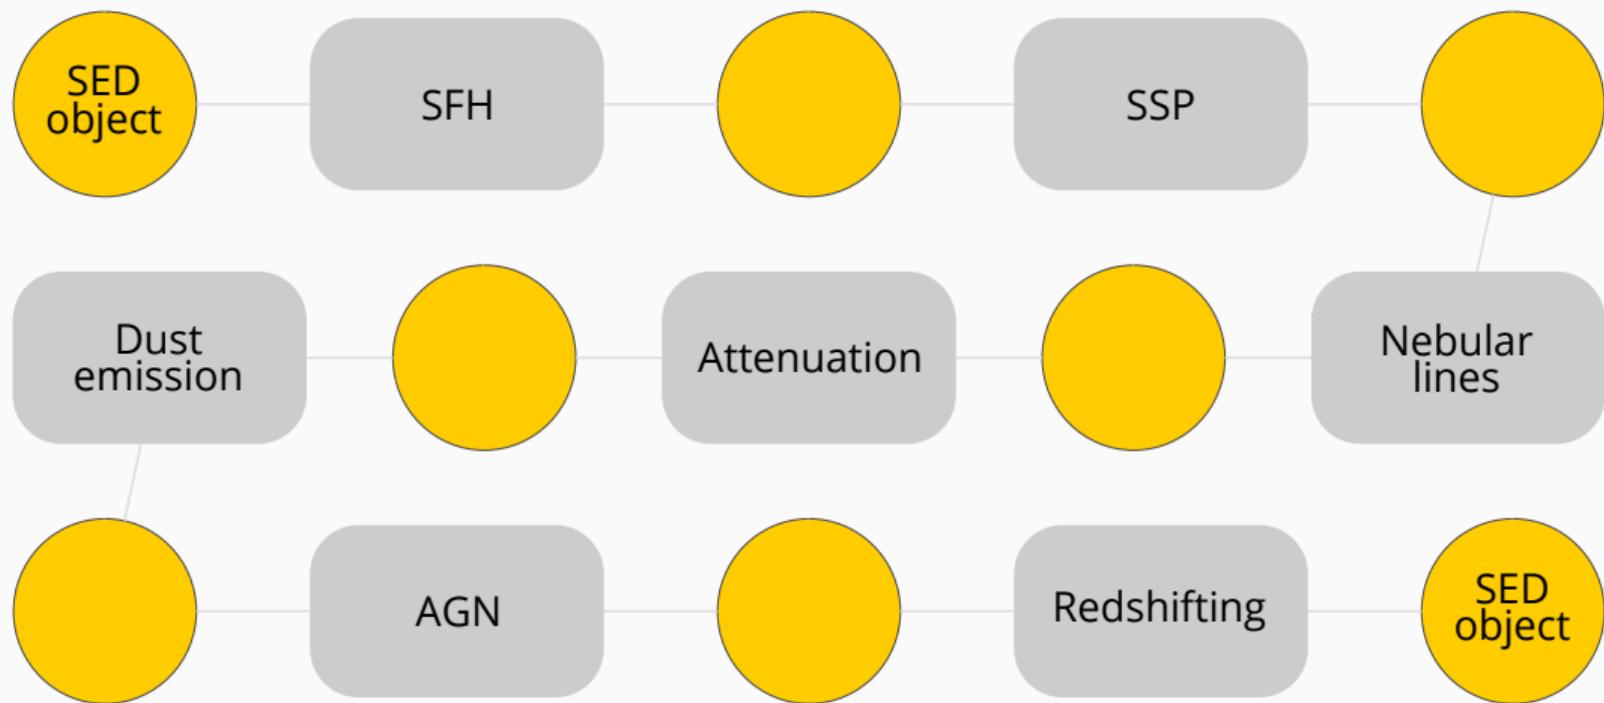

De nombreux modules disponibles (*liste de 2017*)

↓ C I G A L E W O R K - F L O W ↓	PCIGALE INIT	Give the context: input file, which modules to use, SED fitting or modelling, number of processors			
	SFH	2-exp	delayed	periodic	From file
	SSP	BC (2003)	Maraston (2005)	Starburst 99	Schaerer (2002)
	Nebular emission	Continuum + lines			
	Attenuation Law	Modified (slope & bump) Leitherer + Calzetti		Two power laws	
	Dust Models / Templates	Draine & Li (2007, 2014)	Dale et al. (2014)	Casey et al. (2012)	
	Addition IR component	Additional modified black body (w/ or w/o energy balance)			
	AGN Emission	Fritz et al. (2006)			
	Radio	Simple module related to SF			
	Redshifting + IGM	IGM from Meiksin (2006)			
PCIGALE RUN	RUN: <ul style="list-style-type: none"> Parallelized for multi-core computers Easy creation of mock catalogs allowing to test degeneracies 				
	CIGALE 'Classic' Traditional SED Fitting (best model & Bayesian)		CIGALE 'Model' Predicts « observed » SEDs and spectra		
PCIGALE PLOT	SEDs (individual components)	Probability Distribution Functions	χ^2 Distribution Functions	Test from Mock analysis

Le Phare CIGALE HyperZ BEAGLE

What is GAZPAR ?

GAZPAR is a service giving access to astrophysical tools for the estimation of photometric redshifts, as well as physical parameters, from methods adjusting spectral energy distribution (SED) to multi-wavelength observed catalogues. The proposed tools are Le Phare, CIGALE, and HyperZ (see the descriptions below) and benefits from the expertise of associated astronomers.

You just have to upload your catalogues on a private and safe space and with the GAZPAR interface you define and configure the SED modelling tools you want to use (Le Phare, CIGALE, or HyperZ). You can then retrieve the package to execute the SED modelling tools on your computer and/or ask for our astronomers to process the request and provide you with the results, some quality tests and reports.

GAZPAR has been approved as a [national observation service \(AN05\)](#) by the [National Institute for Earth Sciences and Astronomy \(CNRS/INSU\)](#) as a service offered to the community. It is operated by the observatory of the sciences of the Universe [Pythéas](#).

Archive of Spectrophotometry Publicly available In Cesam

What is ASPIC ?

ASPIC is a portal dedicated to giving access to added values produced from several public spectroscopic or spectrophotometric surveys. These added values are hosted at the Centre de données astrophysiques de Marseille (CeSAM), Laboratoire d'Astrophysique de Marseille (LAM), France.

The expertise offered by ASPIC aims to address the whole measurement chain, including redshift measurements and reliability assessment, access to spectra and matched ancillary data like multi-band photometry via a dedicated information system.

ASPIC has been approved as a rational observation service (ANOS) by the National Institute for Earth Sciences and Astronomy (CNRS/INSU) as a service offered to the community. It is operated by the observatory of the sciences of the Universe Cythena.

IOS [March 2020](#) → [EL COSMOS \(v1.0\)](#) [February 2020](#) → [MUSE-Wide](#)

How retrieve ASPIC data ?

- Search around a position
- Search using a combination of criteria
- Get ASPIC database parameters from an object list
- Retrieve full datasets

Data Available in ASPIC

If you are using public ASPIC data, in addition to ASPIC acknowledgments, please quote the official acknowledgments related to the given data.

EL COSMOS (v1.0)

EL-COSMOS is a synthetic emission line catalogue that contains predictions of emission-line fluxes such as [OII] or H α for all ~518,000 COSMOS 2015 photometric galaxies (Leigle et al, 2016). The prediction was calibrated and compared with the spectroscopic measurements in zCOSMOS-Bright and 3D-HST. The release also includes a predicted SED spectrum for each galaxy as well as broadband predicted magnitudes.

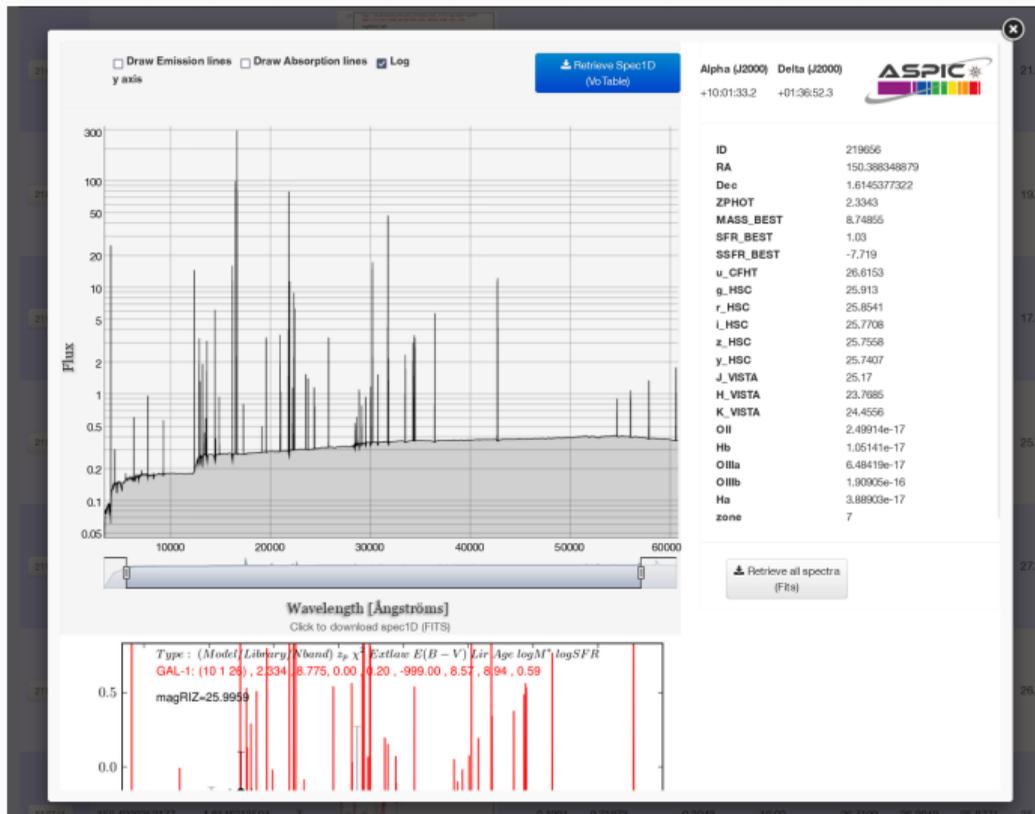

Saito et al., 2020. [arXiv:2003.05394](#)

Data available in ASPIC

Dataset name	Description	Nb objects
EL-COSMOS-V1.0	EL-COSMOS catalogue based on COSMOS 2015 catalogue.	518 000
