DI TORINO

Neutrino oscillations

$$|\nu_\alpha\rangle = \sum_k U_{\alpha k}^* |\nu_k\rangle$$

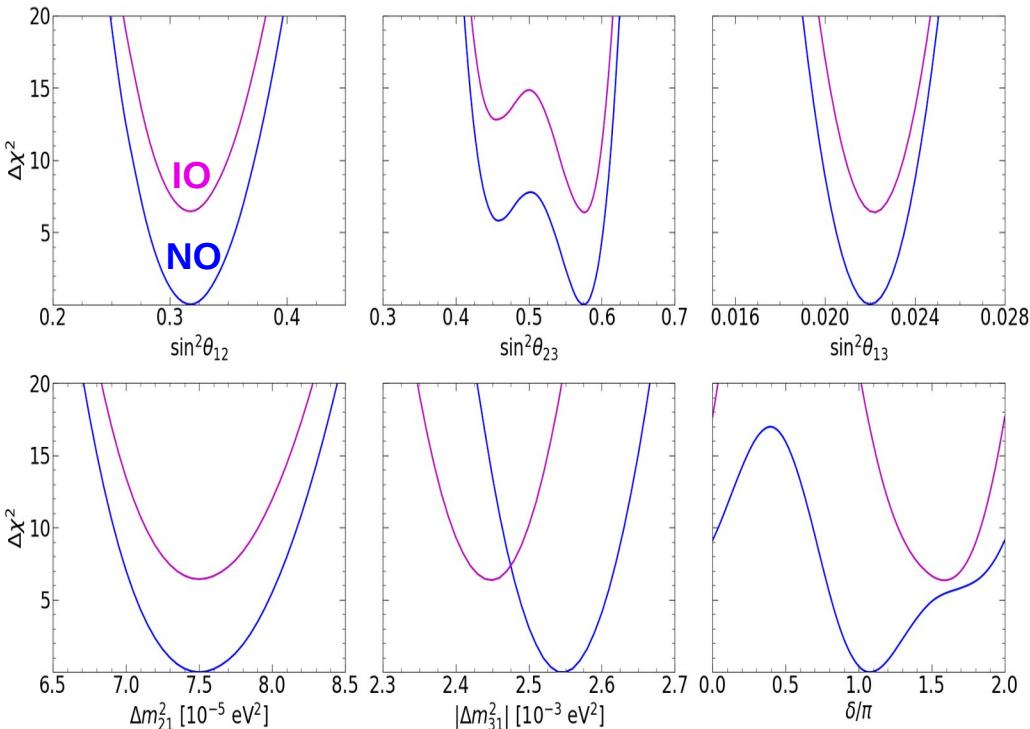

$$|\nu_k(t)\rangle = e^{-iE_k t} |\nu_k\rangle$$

$$\langle \nu_\beta | \nu_\alpha(t) \rangle = \sum_k U_{\alpha k}^* U_{\beta k} e^{-iE_k t}$$

$$P_{\nu_\alpha \rightarrow \nu_\beta}(t) = |A_{\nu_\alpha \rightarrow \nu_\beta}(t)|^2 = \sum_{k,j} U_{\alpha k}^* U_{\beta k} U_{\alpha j} U_{\beta j}^* e^{-i(E_k - E_j)t}$$

Three-neutrino oscillations

Valencia - Global Fit, 2006.11237, JHEP 2021

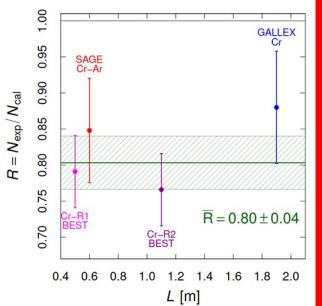

parameter	best fit $\pm 1\sigma$	2σ range	3σ range
$\Delta m_{21}^2 [10^{-5} \text{eV}^2]$	$7.50^{+0.22}_{-0.20}$	7.12–7.93	6.94–8.14
$ \Delta m_{31}^2 [10^{-3} \text{eV}^2]$ (NO)	$2.55^{+0.02}_{-0.03}$	2.49–2.60	2.47–2.63
$ \Delta m_{31}^2 [10^{-3} \text{eV}^2]$ (IO)	$2.45^{+0.02}_{-0.03}$	2.39–2.50	2.37–2.53
$\sin^2 \theta_{12}/10^{-1}$	3.18 ± 0.16	2.86–3.52	2.71–3.69
$\sin^2 \theta_{23}/10^{-1}$ (NO)	5.74 ± 0.14	5.41–5.99	4.34–6.10
$\sin^2 \theta_{23}/10^{-1}$ (IO)	$5.78^{+0.10}_{-0.17}$	5.41–5.98	4.33–6.08
$\sin^2 \theta_{13}/10^{-2}$ (NO)	$2.200^{+0.069}_{-0.062}$	2.069–2.337	2.000–2.405
$\sin^2 \theta_{13}/10^{-2}$ (IO)	$2.225^{+0.064}_{-0.070}$	2.086–2.356	2.018–2.424
δ/π (NO)	$1.08^{+0.13}_{-0.12}$	0.84–1.42	0.71–1.99
δ/π (IO)	$1.58^{+0.15}_{-0.16}$	1.26–1.85	1.11–1.96

$\sim 5\sigma$

MiniBooNE

Anomalies

Three-neutrino oscillations can not account for short baseline anomalies

$$L_{kj}^{\text{osc}} = \frac{4\pi E}{\Delta m_{kj}^2}$$
$$L_{21}^{\text{osc}} \gtrsim 50 \text{ km} \frac{E}{\text{MeV}}$$
$$L_{31}^{\text{osc}} \gtrsim 1 \text{ km} \frac{E}{\text{MeV}}$$

Short baseline oscillations require:

$$\frac{L}{E} \lesssim 10 \text{ m/MeV} \implies \Delta m^2 \gtrsim 0.1 \text{ eV}^2$$

3+1 neutrino oscillations

$$\begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} \end{pmatrix} \Rightarrow \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} & U_{e4} \\ U_{\mu 1} & U_{\mu 2} & U_{\mu 3} & U_{\mu 4} \\ U_{\tau 1} & U_{\tau 2} & U_{\tau 3} & U_{\tau 4} \\ U_{s1} & U_{s2} & U_{s3} & U_{s4} \end{pmatrix}$$

Appearance

$$P_{\alpha\beta}^{\text{SBL}} \approx \sin^2(2\theta_{\alpha\beta}) \sin^2 \left(\frac{\Delta m_{41}^2 L}{4E} \right)$$

$$\sin^2(2\theta_{\alpha\beta}) = 4|U_{\alpha 4}|^2 |U_{\beta 4}|^2$$

Disappearance

$$P_{\alpha\alpha}^{\text{SBL}} \approx 1 - \sin^2(2\theta_{\alpha\alpha}) \sin^2 \left(\frac{\Delta m_{41}^2 L}{4E} \right)$$

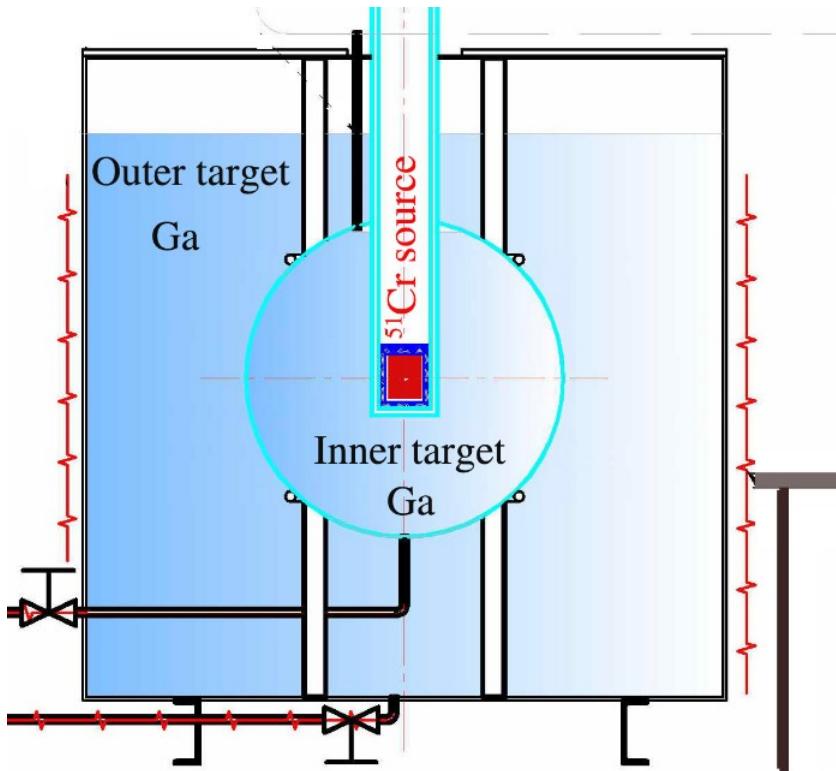

$$\sin^2(2\theta_{\alpha\alpha}) = 4|U_{\alpha 4}|^2 (1 - |U_{\alpha 4}|^2)$$

The reactor antineutrino anomaly: Flux calculations

The neutrino spectrum is produced from the beta decays of the fission products of ^{235}U , ^{238}U , ^{239}Pu , and ^{241}Pu

Summation method

$$S_{\text{tot}}(E, t) = \sum_k F_k(t) S_k(E)$$

fission fractions

$$S_k(E) = \sum_n Y_n^k \quad \sum_b BR_n^b \quad S_n^b(E) \leftarrow$$

cumulative
fission
yield

branching
ratio

allowed or
forbidden
decay
spectrum

There are more than 1000 beta spectra and branching ratios

Nuclear data bases might be incomplete or inaccurate

Conversion method

Measure beta spectra of ^{235}U , ^{238}U , ^{239}Pu , ^{241}Pu and use empirical method to get

$$S_k^e(E_e) \rightarrow S_k^\nu(E_\nu)$$

5 MeV bump

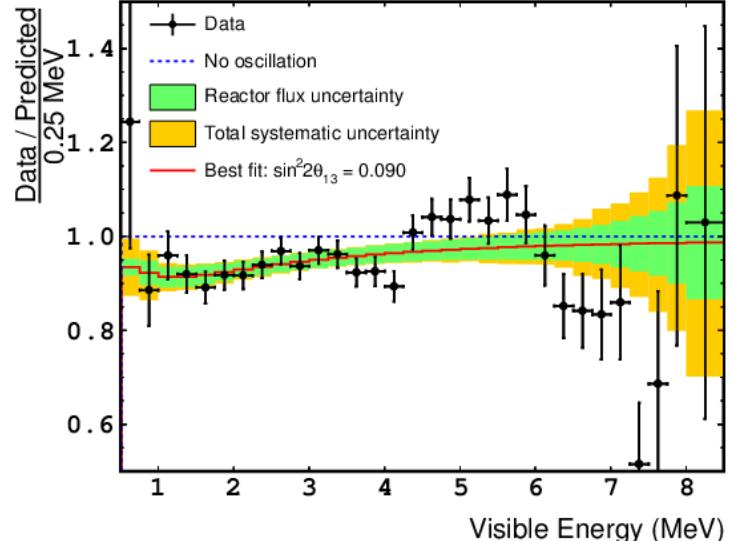

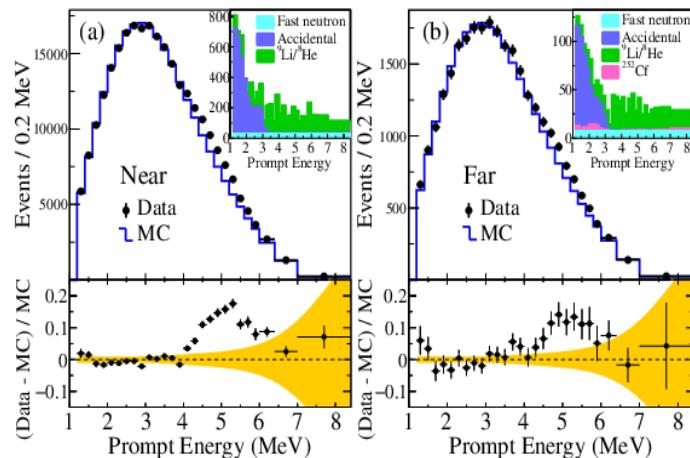

Double Chooz, 1406.7763, JHEP 2015

5 MeV bump discovered in 2014

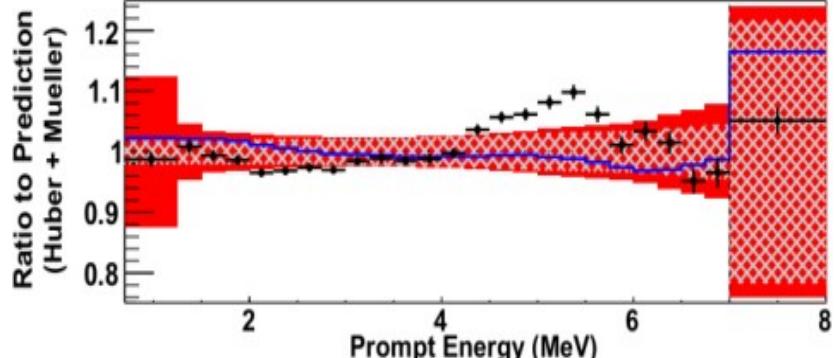

Can not been explained with short baseline oscillations

Proof of our incomplete understanding of nuclear reactor fluxes

RENO, 1511.05849, PRL 2016

Daya Bay, 1508.04233, PRL 2016

Rate calculation

Calculate inverse beta yields for each isotope

We use the Strumia-Vissani IBD cross section

Strumia, Vissani, astro-ph/0302055, PLB 2003

$$\sigma_i = \int_{E_\nu^{\text{thr}}}^{E_\nu^{\text{max}}} dE_\nu \Phi_i(E_\nu) \sigma_{\text{IBD}}(E_\nu)$$

Yields depend on
the neutrino flux

Giunti, Li, Ternes, Xin, 2110.06820, PLB 2022

Neutrino-4

Averaging contains integration over flux, distance, detector resolution

$$\left\langle \sin^2 \left(\frac{\Delta m_{41}^2 L}{4E} \right) \right\rangle_{ik} = \frac{\int_{L_k^{\min}}^{L_k^{\max}} dL L^{-2} \int_{E_i^{\min}}^{E_i^{\max}} dE'_p \int dE_p R(E_p, E'_p) \sin^2 \left(\frac{\Delta m_{41}^2 L}{4E} \right) \phi_{\bar{\nu}_e}(E) \sigma_{\bar{\nu}_e p}(E)}{\int_{L_k^{\min}}^{L_k^{\max}} dL L^{-2} \int_{E_i^{\min}}^{E_i^{\max}} dE'_p \int dE_p R(E_p, E'_p) \phi_{\bar{\nu}_e}(E) \sigma_{\bar{\nu}_e p}(E)}$$

Using energy calibration information from 2005.05301 we extract the approximate energy resolution function

$$R(E_p, E'_p) = \frac{1}{\sqrt{2\pi}\sigma_{E_p}} \exp \left(-\frac{(E_p - E'_p)^2}{2\sigma_{E_p}^2} \right) \quad \sigma_{E_p} = 0.19 \sqrt{\frac{E_p}{\text{MeV}}} \text{ MeV.}$$

Neutrino-4

We can only reproduce Neutrino-4 confidence regions when not including energy resolution

Inclusion shifts the best fit to even larger values, but reduces the preference for sterile oscillations

Global fit (without Gallium data)
has a preference between 2.6σ
and 3.3σ in favor of 3+1
oscillations!

Due to new reactor ratio data

Another new (or revived)
anomaly!

Conclusions

The 3+1 explanation to the Gallium anomaly is in strong tension with the analysis of data of all other classes of experiments

RAA might be resolved for newer flux models

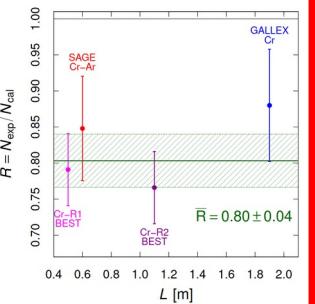

Neutrino-4 preference doubtful

New (revived) preference for SBL oscillations from ratio experiments

More data is needed to clarify open issues

Anomalous AND also Null results have to be checked

Gallium UNSOLVED!

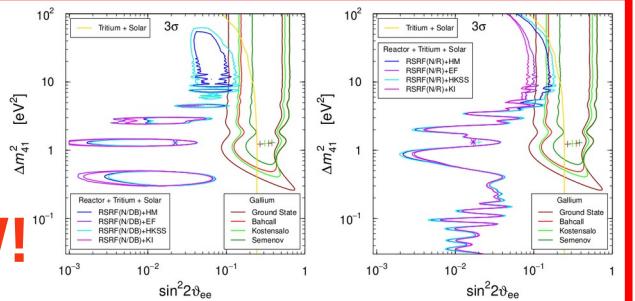

RAA

Possibly solved!

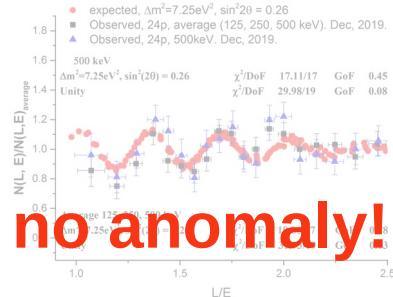

Ratio
NEW!

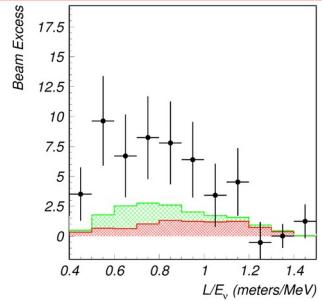

Neutrino-4

Possibly no anomaly!

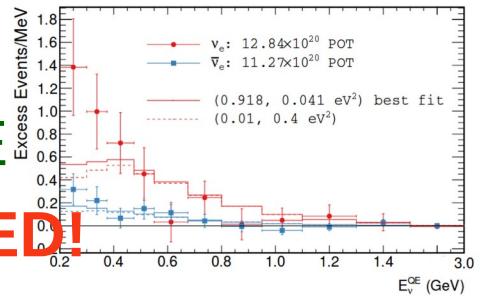

LSND

UNSOLVED!

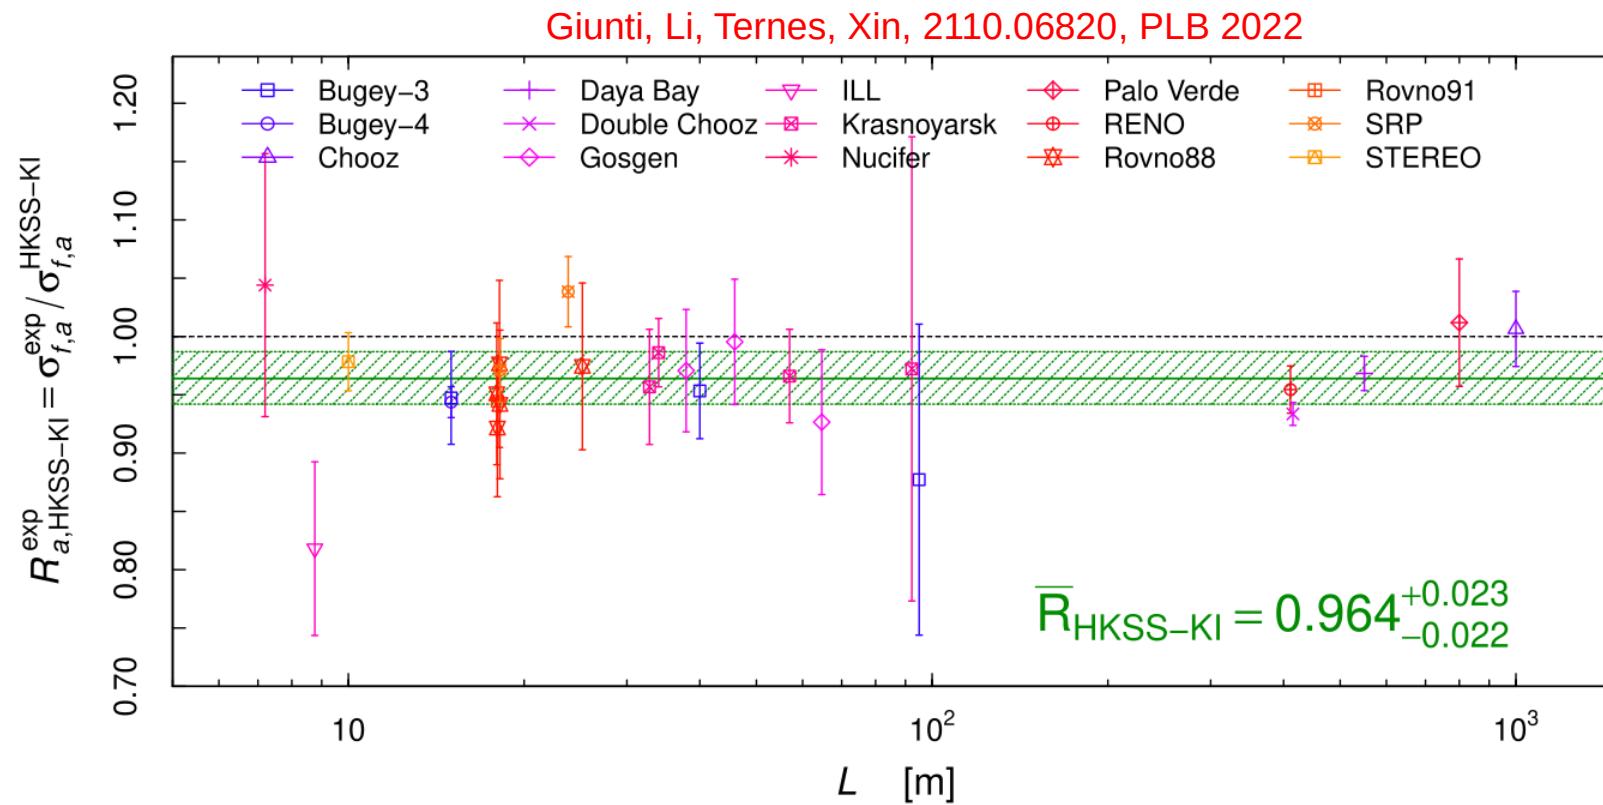

MiniBooNE
UNSOLVED!

Merci!

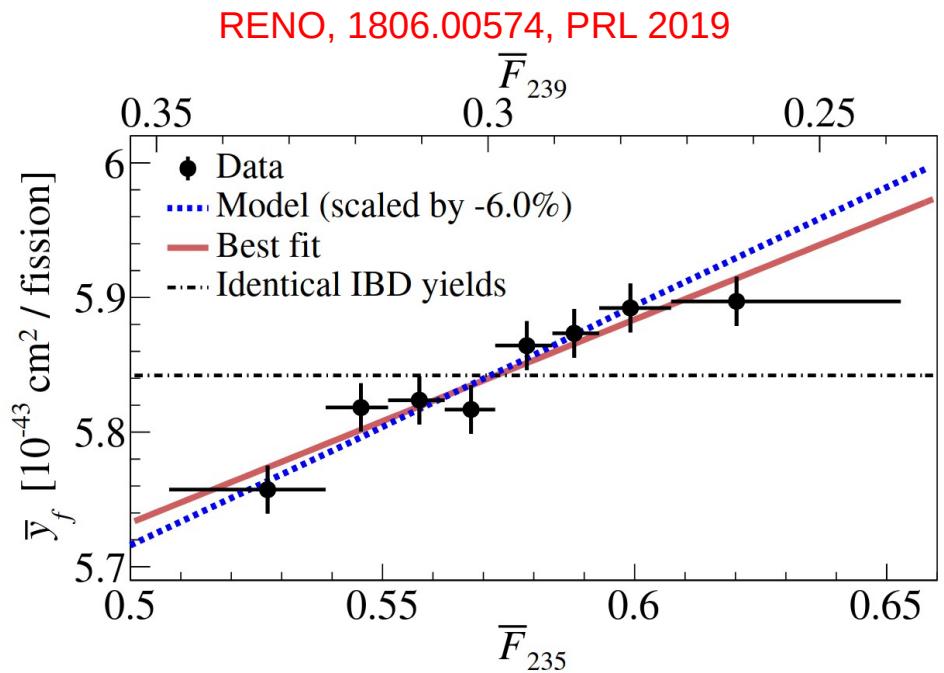

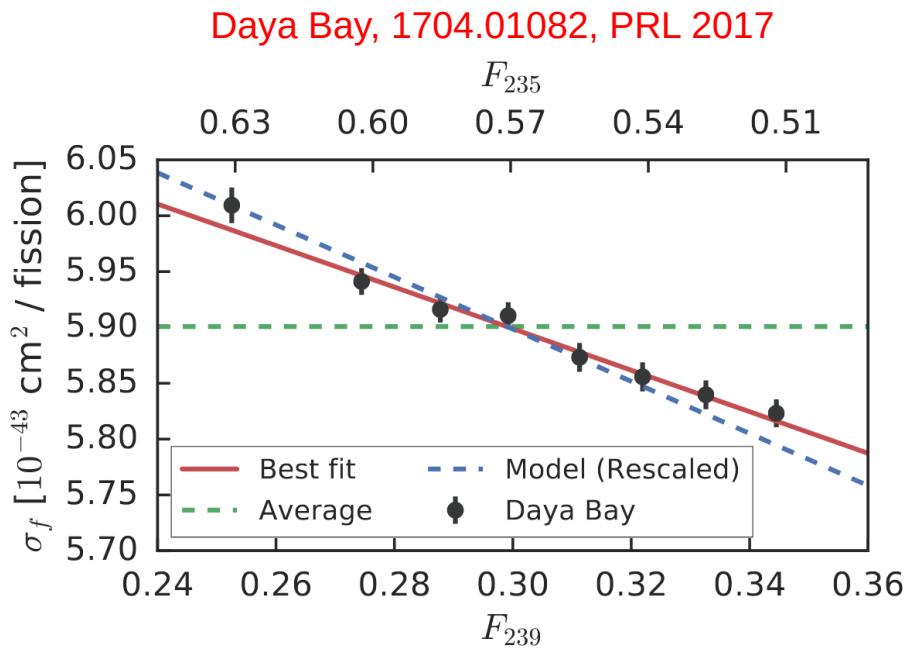

2021 combining HKSS and KI

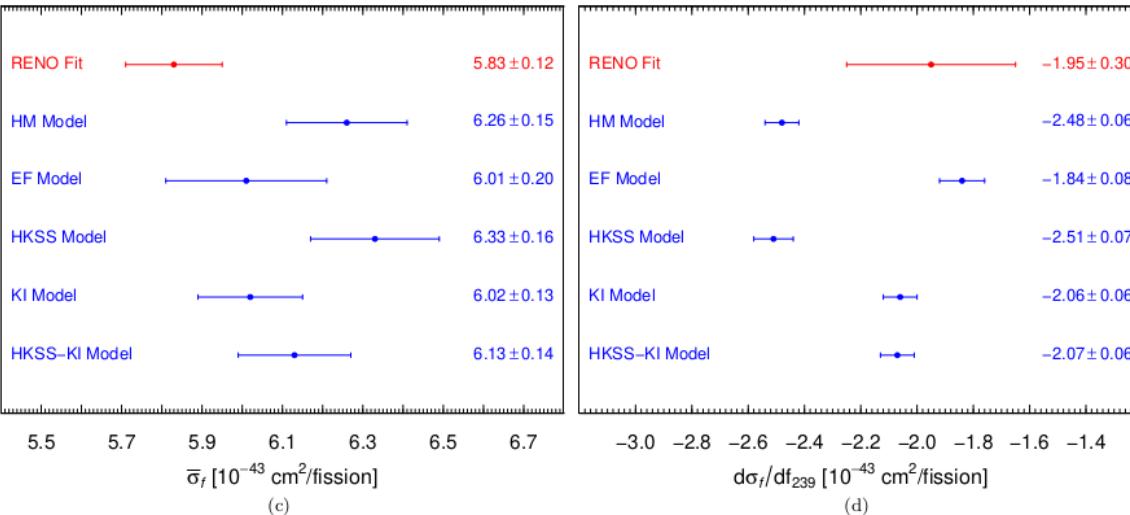

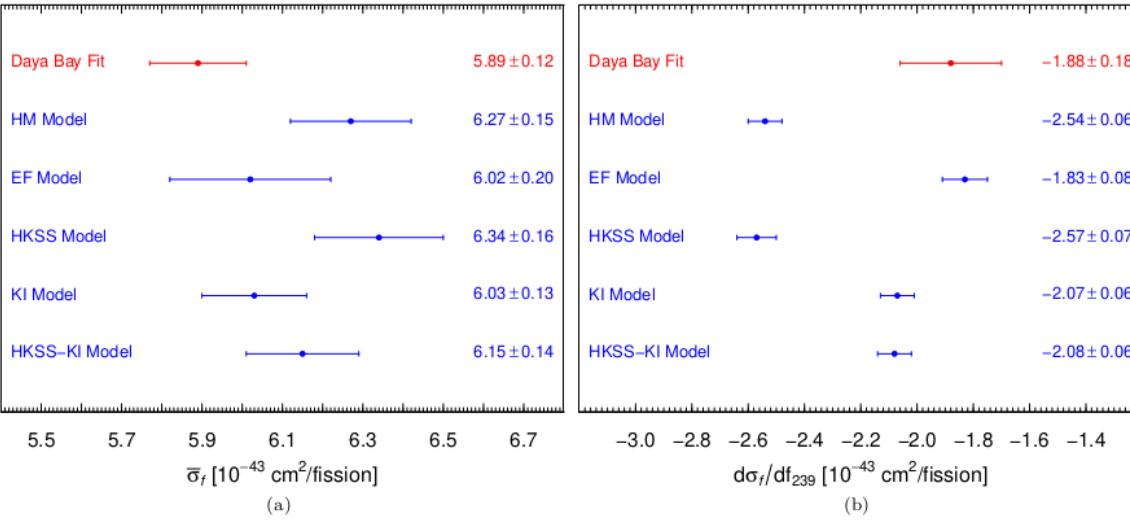

No anomaly (1.5σ) with HKSS-KI flux!

Evolution data

Measure rates at different stages of reactor cycle

Giunti, Li, Ternes, Xin, 2110.06820, PLB 2022

We get additional information from the measurement of the slope parameter

Evolution data

Effect of evolution data on RAA

Model	Rates		Evolution		Rates + Evolution	
	\bar{R}_{mod}	RAA	\bar{R}_{mod}	RAA	\bar{R}_{mod}	RAA

Neutrino-4

Giunti, Li, Ternes, Zhang, 2101.06785, PLB 2021

We can only reproduce Neutrino-4 confidence regions when not including energy resolution
Inclusion shifts the best fit to even larger values, but reduces the preference for sterile oscillations

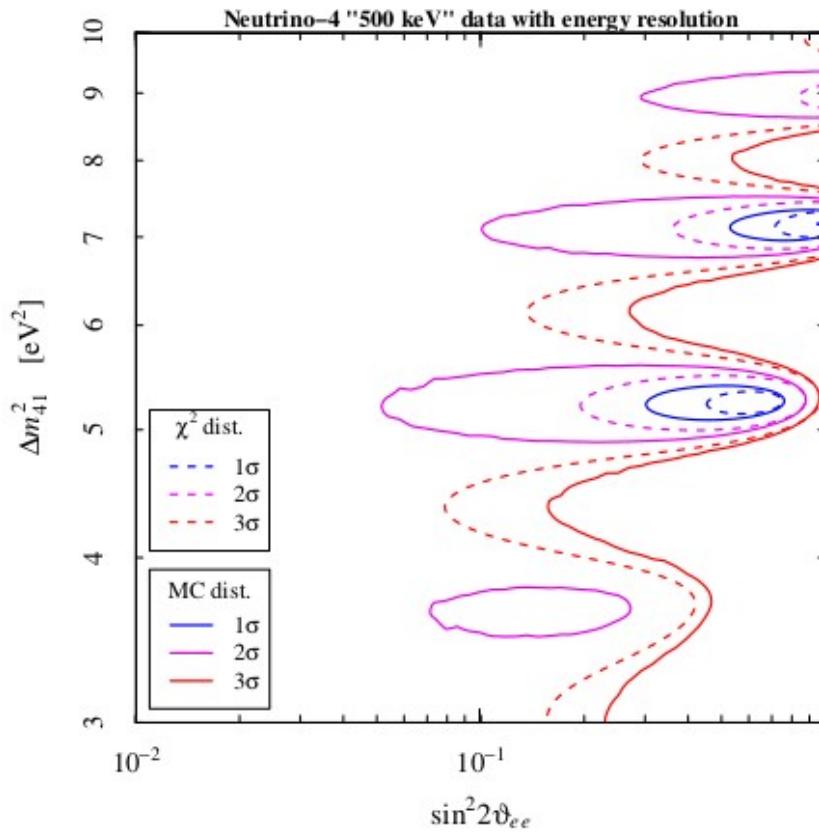

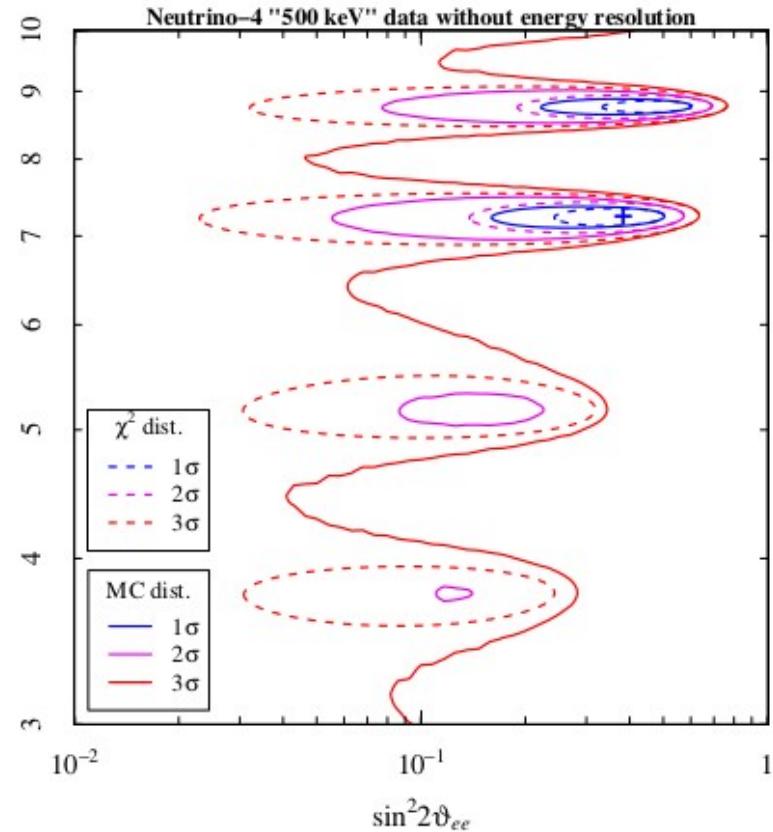

$$\chi^2 = \sum_{j=1}^{19} \left(\frac{R_j^{\text{the}} - R_j^{\text{exp}}}{\Delta R_j^{\text{exp}}} \right)^2$$

Monte Carlo analysis

CPT violating neutrinos?

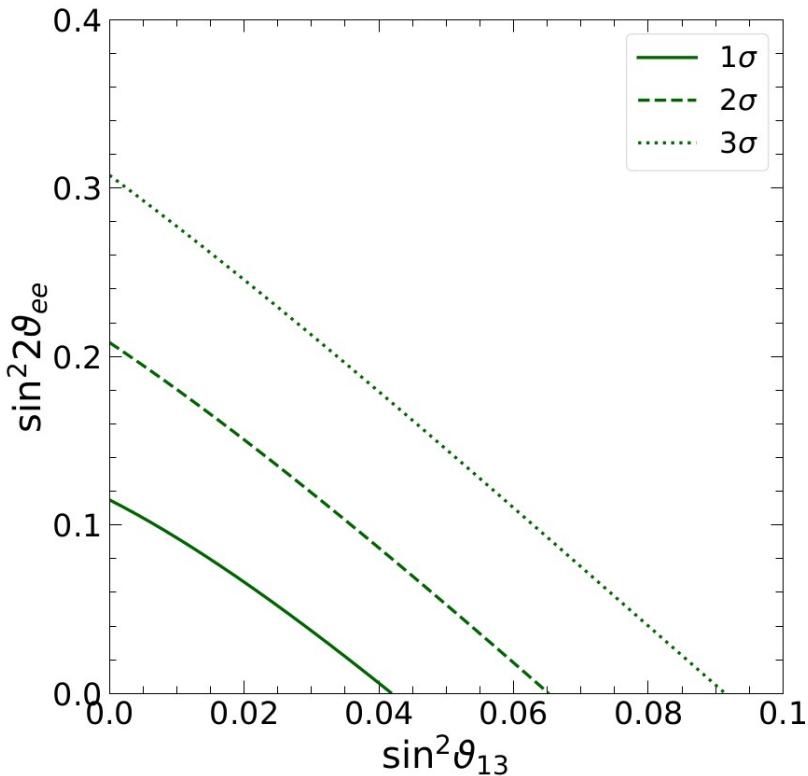

Allowing for different neutrino and antineutrino oscillation parameters could solve the tension between Reactor+Tritium data and Gallium data

$$A_{\Delta m^2}^{\text{CPT}} = \Delta m_\nu^2 - \Delta m_{\bar{\nu}}^2 ,$$
$$A_{\sin^2 2\vartheta}^{\text{CPT}} = \sin^2 2\vartheta_\nu - \sin^2 2\vartheta_{\bar{\nu}}$$

Giunti, Laveder, 1008.4750, PRD 2010

CPT violating neutrinos?

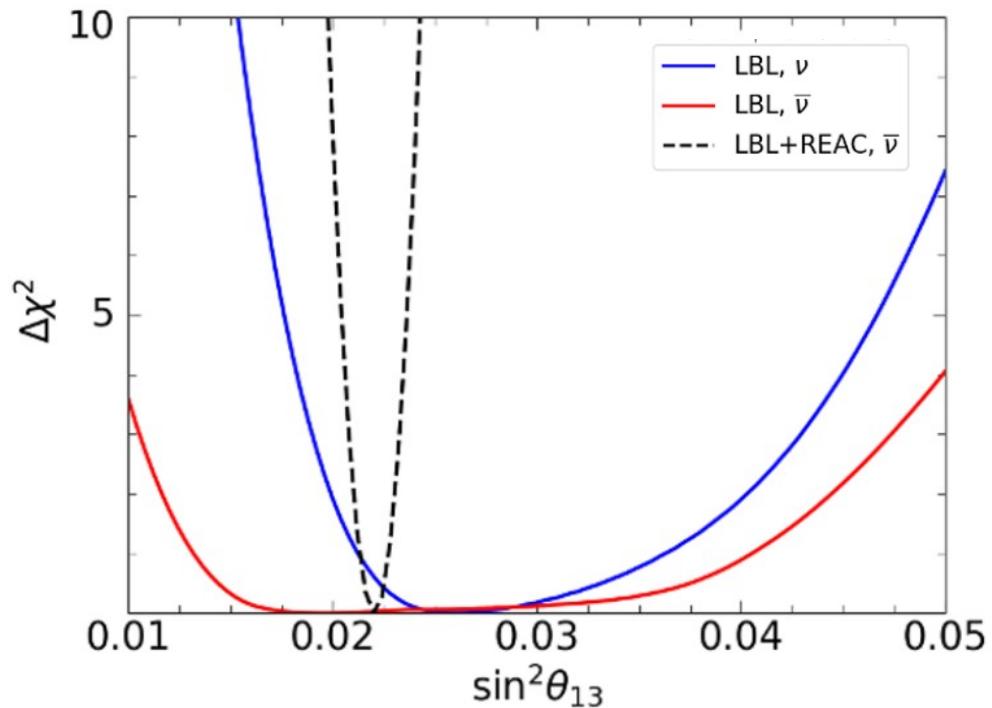

Solar experiments measure neutrinos, not antineutrinos!
Solar bound is relaxed when leaving reactor angle free!

Giunti, Li, Ternes, Tyagi, Zhao, 2209.00916, JHEP 2022

See also: Goldhagen, Maltoni, Reichert, Schwetz,
2109.14898, EPJC 2022

CPT violating neutrinos?

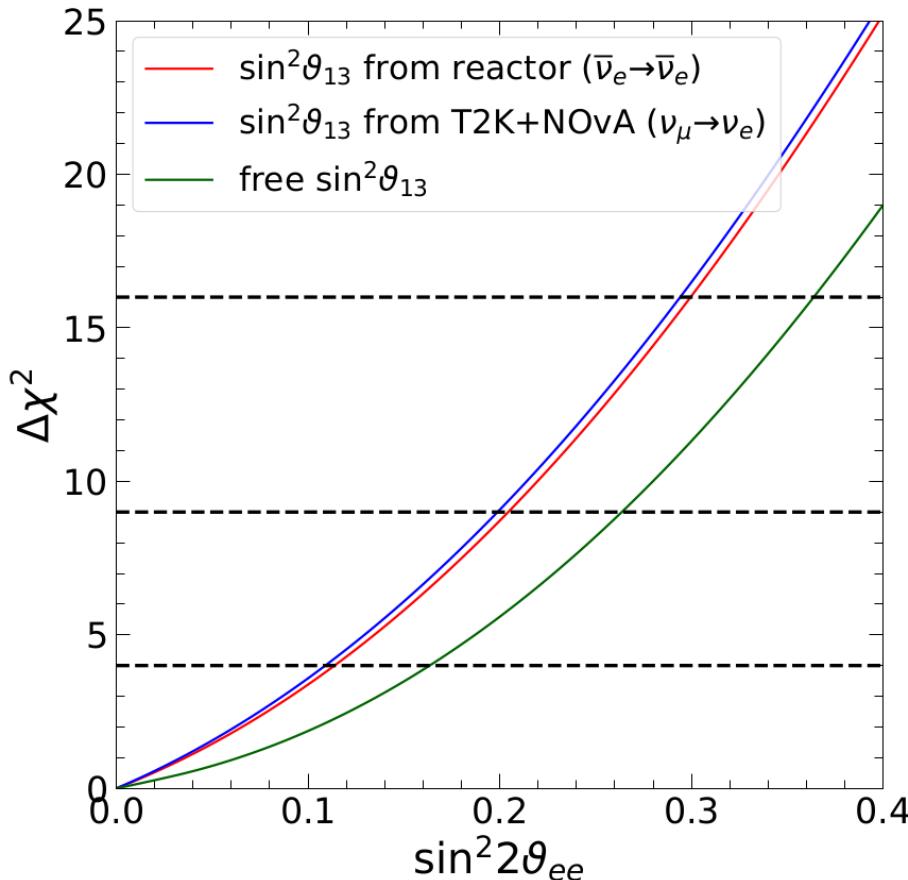

Solar experiments measure neutrinos, not antineutrinos!

Solar bound is relaxed when leaving reactor angle free!

However, data from NOvA and T2K are able to bound the neutrino angle now, too.

Barenboim, Ternes, Tortola, 2005.05975, JHEP 2020

No CPT violating neutrinos

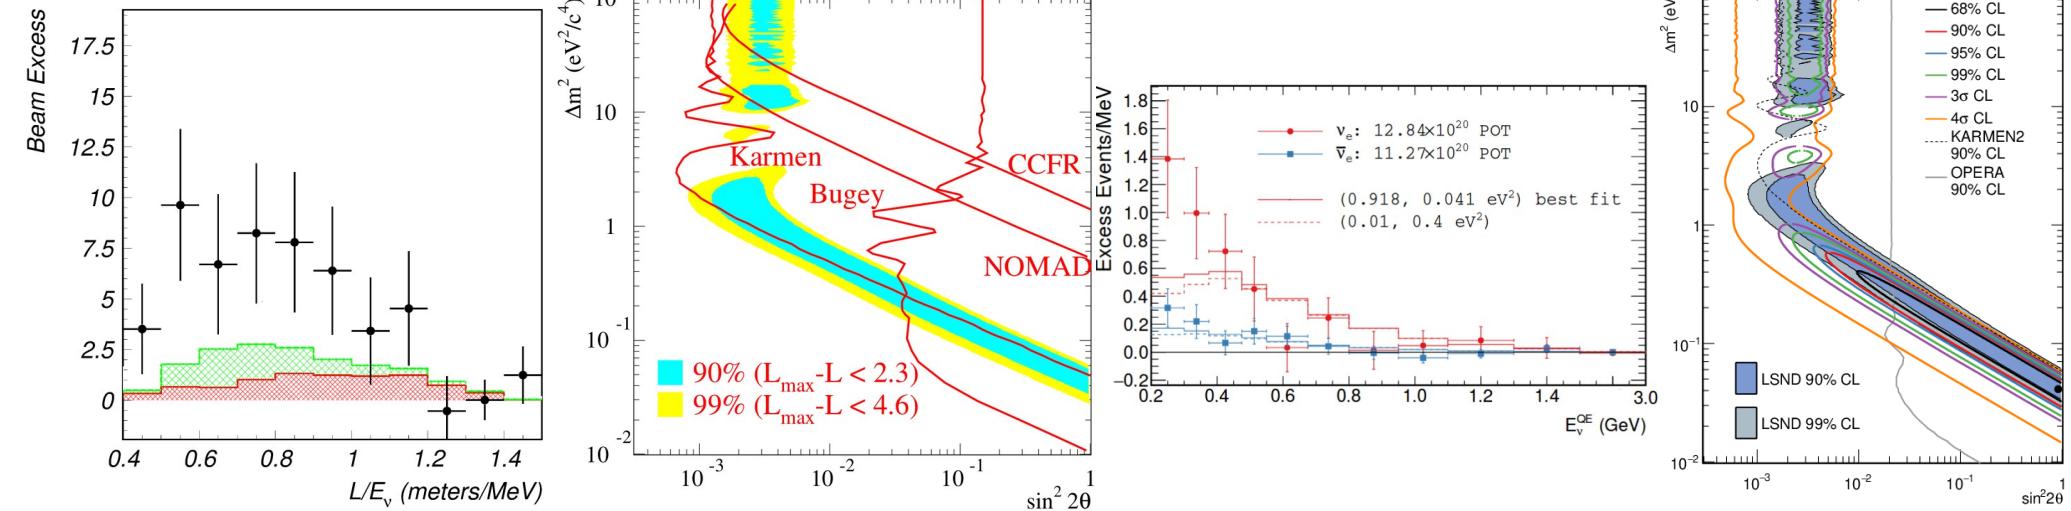

Using the newest solar data the CPT violating explanation is not viable anymore

	Solar-only $\Delta\chi^2_{PG}$	S+ ϑ_{13} (T&N) $\Delta\chi^2_{PG}$	S+ ϑ_{13} (R) $\Delta\chi^2_{PG}$
