New developments in SModelS Inferring results from LHC Searches Searching for new physics at the LHC

Data interpretation in LHC searches

The ATLAS and CMS searches for supersymmetry (SUSY) interpret their data using simplified models (minimal set of parameters).

How would such results constrain a more complex model?

IRN Terascale

arXiv:1105.2838

New developments in SModelS Inferring results from LHC Searches Reinterpreting Results with SModelS

Two methods to reinterpret results

Test phase-space points and exclude it if

$$\boxed{r = \frac{\sigma^{\rm BSM}}{\sigma^{\rm BSM}_{\rm UL}} \geqslant 1} \text{ using:}$$

Cross-section upper limit maps:

$$\begin{split} \sigma^{\mathsf{BSM}} &= \sum \sigma \prod \mathsf{BR} \leftarrow \mathsf{input file.} \\ \sigma^{\mathsf{BSM}}_{\mathsf{UL}} &= \sigma^{\mathsf{BSM}}_{\mathsf{95\%}} \leftarrow \mathsf{experimental publications.} \end{split}$$

Two methods to reinterpret results

Test phase-space points and exclude it if
$$r = \frac{\sigma^{\text{BSM}}}{\sigma^{\text{BSM}}_{\text{UL}}} \ge 1$$
 with:

Efficiency maps:

$$\begin{split} \sigma^{\mathsf{BSM}} &= \epsilon \times \mathcal{A} \sum \sigma \prod \mathsf{BR} \;\; \mathsf{per \; signal \; region} \leftarrow \mathsf{input \; file \; and \; exp. \; pub.} \\ \sigma^{\mathsf{BSM}}_{\mathsf{UL}} \leftarrow \mathsf{exp. \; pub. \; or \; computed \; through \; an \; hypothesis \; test:} \end{split}$$

$$\sigma_{\rm UL}^{\rm BSM} = \frac{s_{\rm UL}}{\mathcal{L}} = \mu_{\rm UL} \frac{s}{\mathcal{L}} \,, \quad s = n_{\rm signal}.$$

Two methods to reinterpret results

Test phase-space points and exclude it if
$$r = \frac{\sigma^{\text{BSM}}}{\sigma^{\text{BSM}}_{\text{UL}}} \ge 1$$
 with:

Efficiency maps:

$$\begin{split} \sigma^{\text{BSM}} &= \epsilon \times \mathcal{A} \sum \sigma \prod \text{BR} \text{ per signal region} \leftarrow \text{input file and exp. pub.} \\ \sigma^{\text{BSM}}_{\text{UL}} \leftarrow \text{exp. pub. or computed through an hypothesis test:} \end{split}$$

$$\sigma_{\rm UL}^{\rm BSM} = \frac{s_{\rm UL}}{\mathcal{L}} = \mu_{\rm UL} \frac{s}{\mathcal{L}} \,, \quad s = n_{\rm signal}.$$

For 1 signal region:

$$L(\mu, \theta|D) = \frac{(\mu \times s + b + \theta)^{n^{obs}} e^{-(\mu \times s + b + \theta)}}{n^{obs}!} e^{-\frac{\theta^2}{2\delta^2}} .$$

Efficiency maps allow SModelS to compute likelihoods for the hypothesised signal \rightarrow more than a binary information (excluded or not).

Using efficiency maps to reinterpret results

Signal region combination is possible using full statistical models (ATLAS), encoded in a json file and interfaced to SModelS with pyhf. HistFactory likelihood:

$$L(\mu, \theta|D) = \prod_{i=1}^{N} \frac{(\mu s_i + b_i + \theta_i)^{n_i^{obs}} e^{-(\mu s_i + b_i + \theta_i)}}{n_i^{obs}!} \prod_{\theta \in \{\theta\}} c_{\theta}(a_{\theta}|\theta).$$

The correlations can otherwise be encoded in a covariance matrix (CMS). Simplified likelihood:

$$L(\mu, \theta | D) = \prod_{i=1}^{N} \frac{(\mu s_i + b_i + \theta_i)^{n_i^{obs}} e^{-(\mu s_i + b_i + \theta_i)}}{n_i^{obs}!} e^{-\frac{1}{2} \overrightarrow{\theta}^T V^{-1} \overrightarrow{\theta}}$$

Impacts on the MSSM EWino sector

New developments in SModelS Interface to Spey

2) Database updates

What is Spey?

- Spey: Statistical analysis for Phenomenology from Experimental Yields.
- Under development by Jack Araz (IPPP Durham).
- A new statistics tool which can simultaneously use various backends and efficiently combine them within one statistical model.
- For the moment, implemented backends are: pyhf and simplified likelihood framework.

New developments in SModelS Interface to Spey

Why switch to Spey?

- Clearer code/centralize the statistical computations.
- Reinterpretation tools can all interface to the same, well-tested framework.
- Proper way to combine statistical models from different backends.
- Easy way to implement new backends (e.g. linearized systematic uncertainties, see Nicolas Berger's talk right after).

Work in progress

- Substitution of SModelS statistical computations by Spey. ${\bf \ } {\bf \ } L_{BSM}, \, L_{SM}, \, L_{max}, \, \mu_{\rm UL}^{\rm exp}, \, \mu_{\rm UL}^{\rm obs}$
- Consistency checks and revalidation of all experimental results in the database.

Combination of 35 signal regions

Combination of 39 regions (36 SR + 3 CR)

Spey for the combination of analyses

From SModelS v.2.2 on, it is possible to combine uncorrelated analyses.

$$L_{\text{combined}}(\mu) = \prod_{i} L_{i}(\mu, \theta_{i} | D_{i})$$

Will fix some issues when combining analyses with different backends.

SModelS parameters.ini file.

Conclusion

- \rightarrow SModelS v.2.3 (to be realesed soon):
 - 11 new or upgraded analyses (5 CMS and 6 ATLAS) in the database.
 - → CMS: 2 simplified likelihoods
 - → ATLAS: 2 full likelihoods
 - 2 simplified likelihoods
 - 1 best SR likelihood
 - Delegation of statistical computations to Spey.
 - Full set of EWino searches and improved statistics tool.
- \rightarrow Future:
 - SModelS v.3.0: constrain models without a $\mathbb{Z}_2\text{-like}$ symmetry.

Acknowledgments

Many thanks to the IRN Terascale organizers and to the coordinators of the methods and tools session.

This work was funded thanks to the ANR-15-IDEX-02 (APM@LHC), ANR-21-CE31-0023 (PRCI SLDNP) and IN2P3 master project "Théorie – BSMGA".

$$L_{\text{combined}}(\mu) = \prod_{i} L_{i}(\mu, \theta_{i}|D_{i})$$

Under-fluctuation in the background leads to negative $\hat{\mu}$.

$$L_{\text{combined}}(\mu) = \prod_{i} L_{i}(\mu, \theta_{i} | D_{i})$$

Excess in the data leads to positive $\hat{\mu}$.

Database v.2.2.0:

Run 2 - 13 TeV

In total, we have results from 35 ATLAS and 39 CMS 13 TeV searches.

- · ATLAS upper limits: 32 analyses, 80 (of which 4 LLP) results
- ATLAS efficiency maps: 21 analyses, 65 (of which 11 LLP) results, 599 individual maps
- · CMS upper limits: 36 analyses, 143 (of which 3 LLP) results
- CMS efficiency maps: 8 analyses, 53 results, 3186 individual maps

Run 1 - 8 TeV

In total, we have results from 15 ATLAS and 18 CMS 8 TeV searches.

- ATLAS upper limits: 13 analyses, 34 results
- ATLAS efficiency maps: 10 analyses, 31 results, 269 individual maps
- · CMS upper limits: 16 analyses, 56 (of which 3 LLP) results
- · CMS efficiency maps: 9 analyses, 47 (of which 9 LLP) results, 980 individual maps

ATLAS-SUSY-2013-12

8 TeV search for $\tilde{\chi}_2^0 \tilde{\chi}_1^{\pm} \rightarrow 3$ leptons + MET. Implementation of efficiency maps:

TChiChipmSlepL: $pp \rightarrow \tilde{\chi}_{1}^{2}\tilde{\chi}_{1}^{2}, \tilde{\chi}_{2}^{2}\tilde{\chi}_{1}^{2} \rightarrow \tilde{h}(v\tilde{v})/\tilde{v}(v\tilde{l}), \tilde{l} \rightarrow h\tilde{g}_{2}^{2}, \tilde{m}_{2}, v\tilde{g}_{2}^{2}x, m_{\tilde{v}}, m_{\tilde{l}} = 0.5 * x + 0.5 * y, m_{\tilde{v}} = y$
