# Biological dose

## Objective of the biological dose

effects of the physical dose on biological tissues

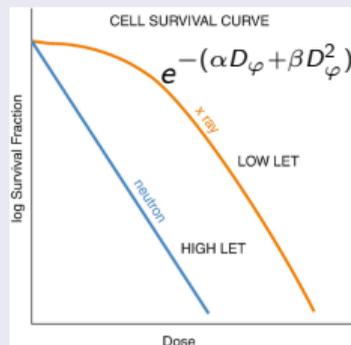

$$D_B = RBE \times D_\varphi$$

$D_B$  : biological dose,  $D_\varphi$  : physical dose,  $RBE$  : Relative Biological Effectiveness

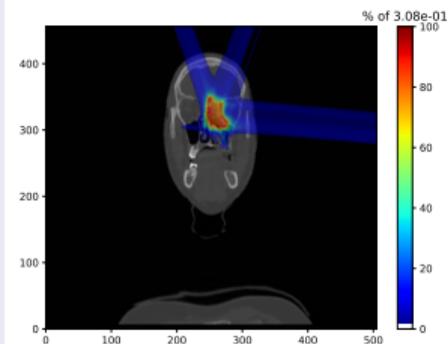

### nano/micro scale

- mMKM  
(Kase et al., 2006)
- NanOx  
(Cunha et al., 2017)

### cellular scale

### macro scale

Cell line: Human Salivary Glands (HSG)  $\implies$  HSG\_mMKM.db or HSG\_NanOx.db

$\implies (\alpha, \beta)$  linearly interpolated from the database file

# BioDoseActor main process

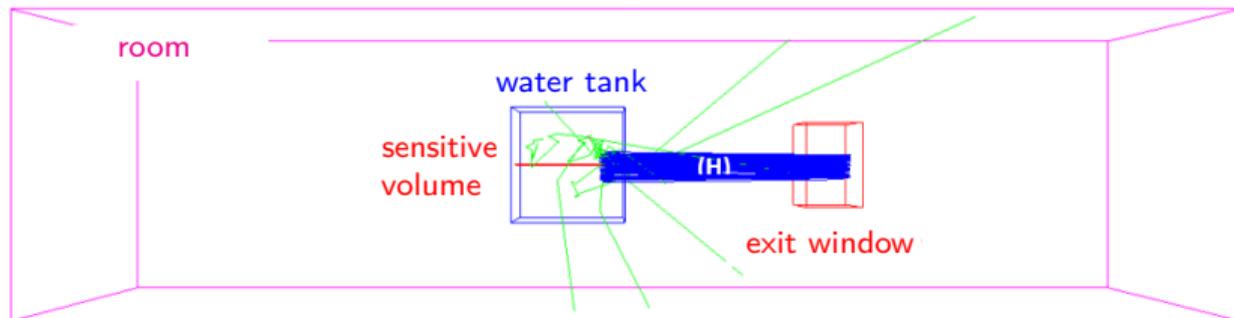

\* ion in {Hydrogen, Helium, Carbon, Oxygen, Lithium}

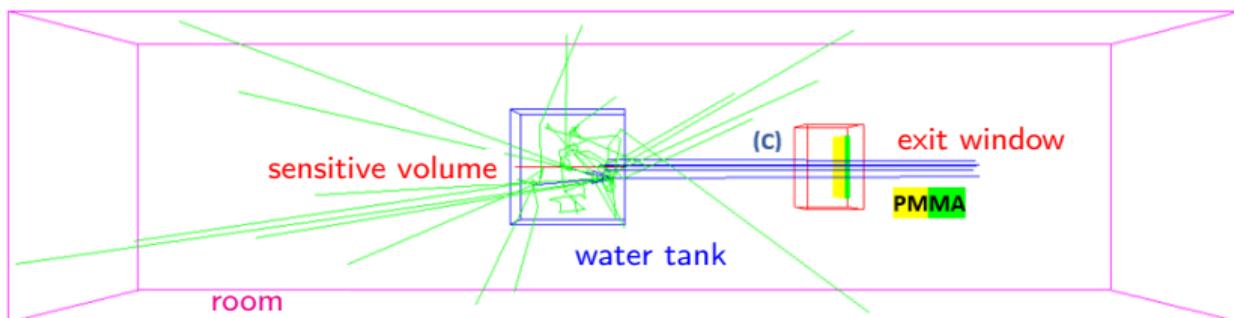

# proton and C-ion clinical PBS beams in water

- Human Salivary Glands
- Pencil Beam Scanning:
  - H: 95.9 – 113 MeV/u
  - C: 120 – 402 MeV/u
- Water box:  
40 × 40 × 40 cm<sup>3</sup>
- Sensitive volume:  
3 × 3 × 400 cm<sup>3</sup>
- Voxel size:  
1 × 1 × 1 mm<sup>3</sup>
- PhysicsList:
  - H: QGSP\_BIC\_EMZ
  - C: Shielding\_EMZ
- multiple stepfunctions
- multiple steplimiters

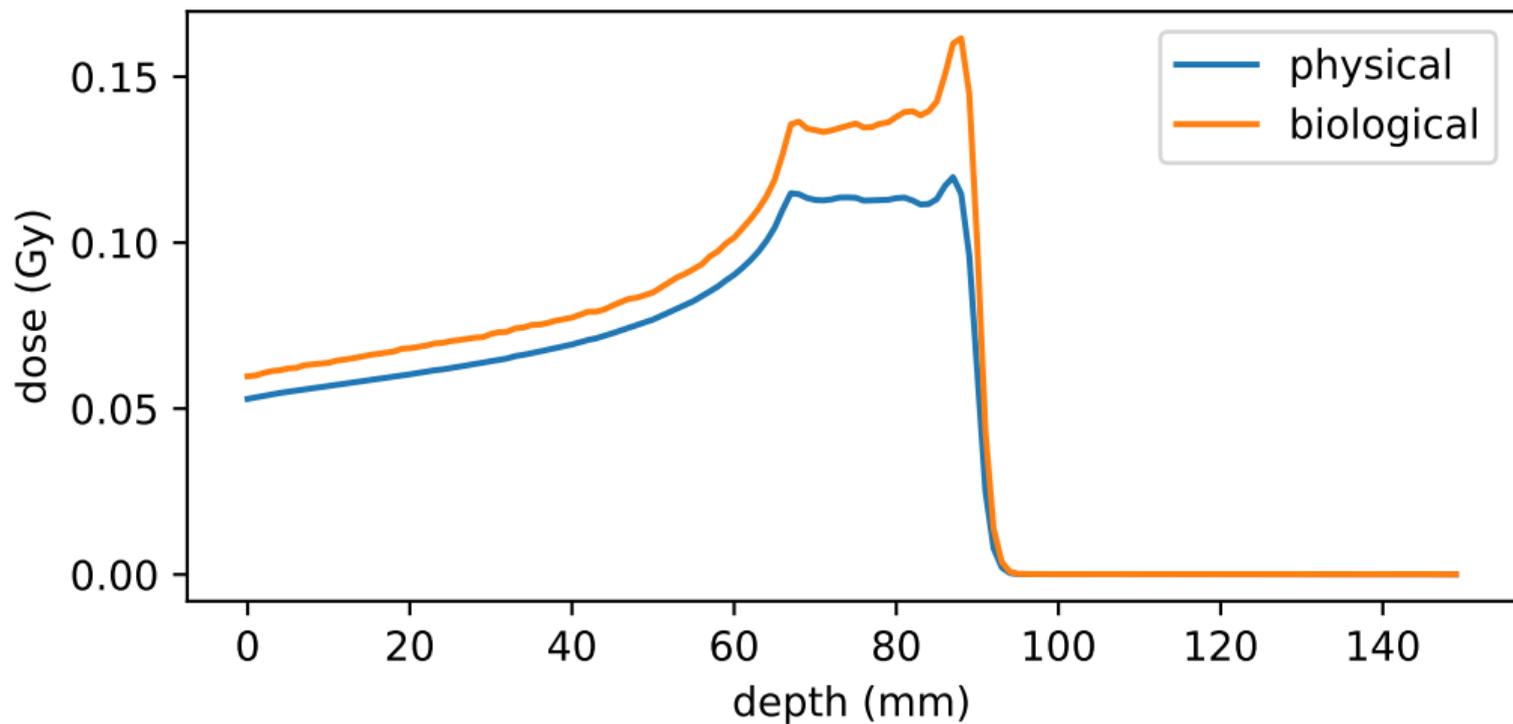

H-ion:

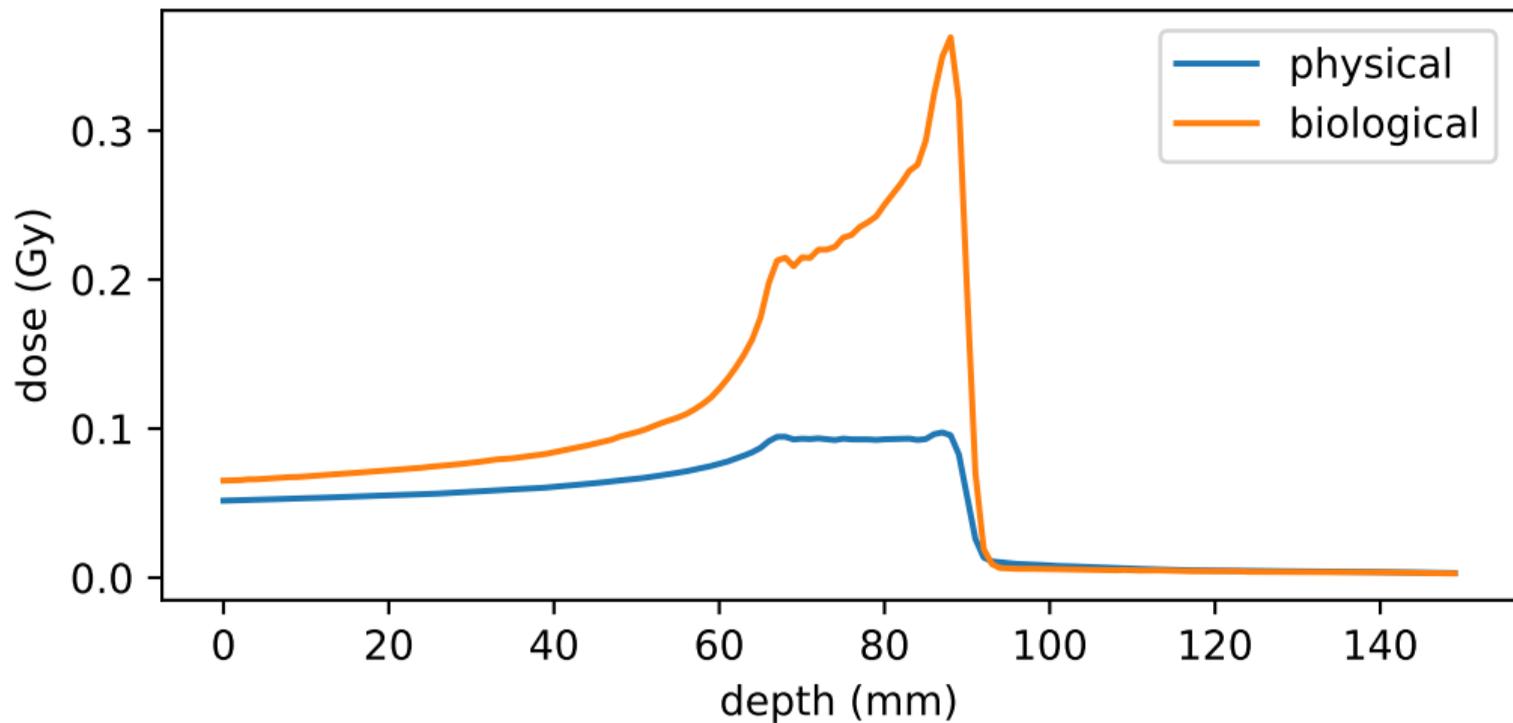

C-ion:

## Results – water, proton, NanOx

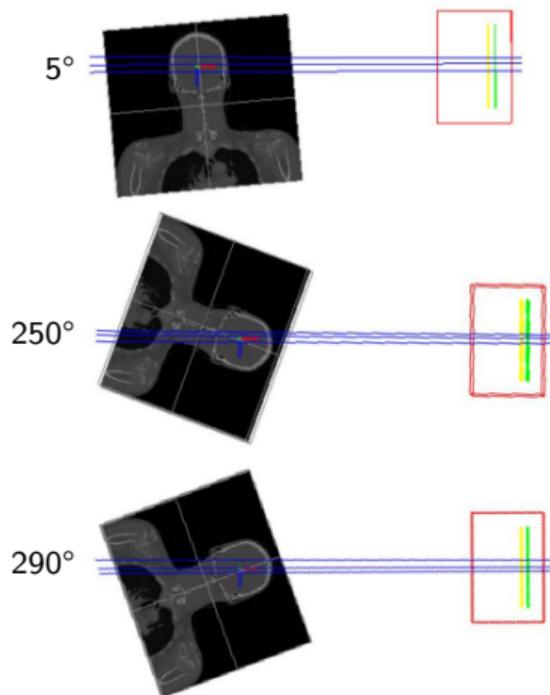

## Results – water, carbon-ion, mMKM

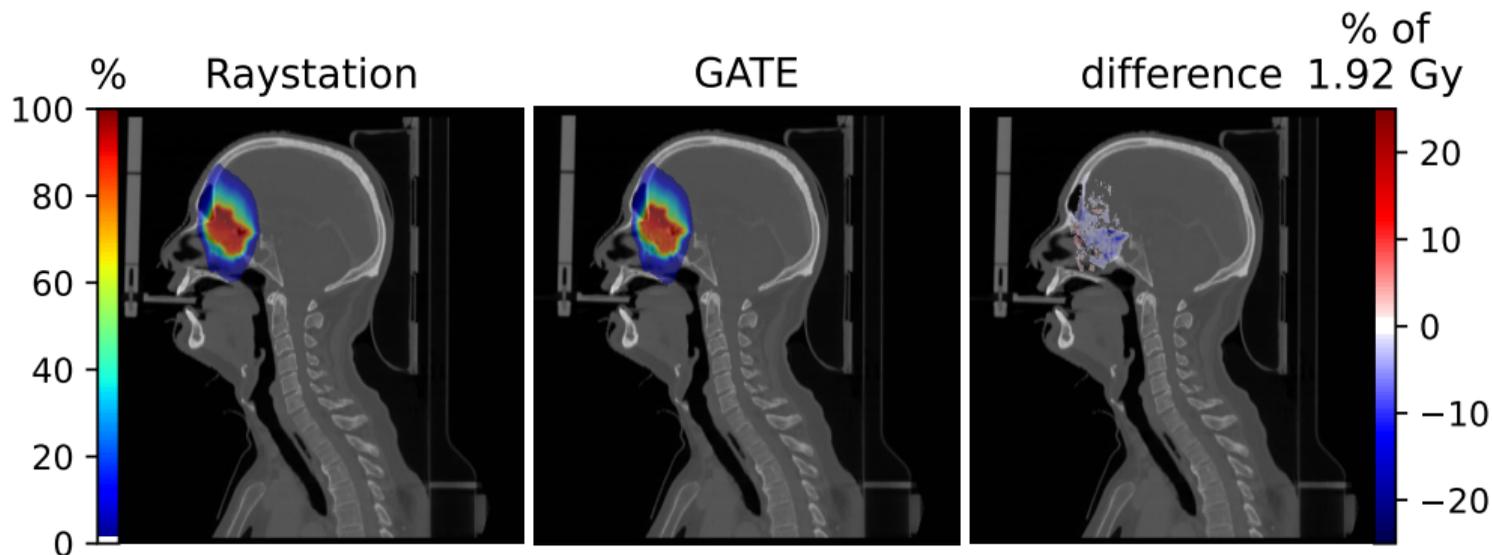

## C-ion clinical PBS beams in patient

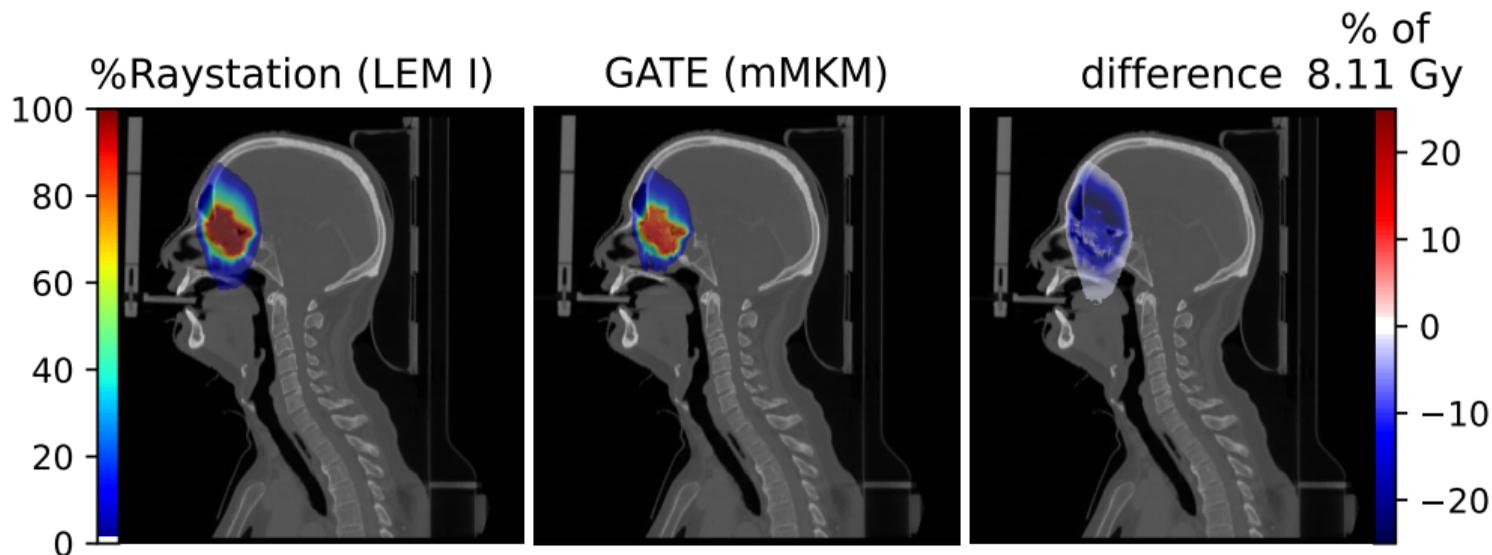

- Human Salivary Glands
- Pencil Beam Scanning
- CT:  $50 \times 50 \times 44 \text{ cm}^3$
- Voxel size:  
 $0.97 \times 0.97 \times 2 \text{ mm}^3$
- PhysicsList:  
Shielding\_EMZ
- 3 beams
- sinonasal chordoma

## Results – C-ion, physical dose

# Results – C-ion, biological dose (mMKM)

## Converted to GATE 10

- Biodose actor class from GATE 9
- GATE 9 biodose "messenger" class (now in Python)

## Work in progress

- Pencil Beam Scanning source (Martina Favaretto (MedAustron))
- benchmark for the biodose actor

### Biodose actor (GATE 9) validated

- in water and patient;
- with two biophysical models: mMKM, NanOx.

### Next

- cross comparison to be done with RBE actor by MedAustron
- Biodose actor in GATE 10 by june 2023
- Tumor Control Probability (TCP) / Normal Tissue Control Probability (NTCP) actor (postdoc Thomas Berger, LABEX primes, 1 year)
