→ Expanding collaboration (+Europe, +Asia, ...)

CAGRA project

- By using the existing Compton Suppressed Ge Clover detectors from laboratories in Japan and the U.S. + China, it is assembled to the CAGRA array at RCNP/RIBF to be utilized in gamma-ray spectroscopy.
- Physics experiments at RCNP using EN, GR, MuSIC
- At RIBF using both energy degraded and stopped beams of exotic nuclei.
- Mechanical Infrastructures to be built
 - Self contained, trigger-less acquisition system using Gretina Digitizers
 - Liquid Nitrogen filling system
 - Support structure
- Physics Scope
 - Multi-Step Coulomb excitation
 - Transfer or Deep Inelastic reactions
 - Fusion Evaporation
 - Stopped Beams

Exp. at RCNP

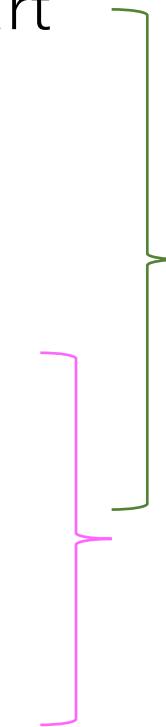

- Exp. at EN beam line
- Exp. at Grand Raiden

Exp. at JAEA

Exp. at RIBF

Introduction

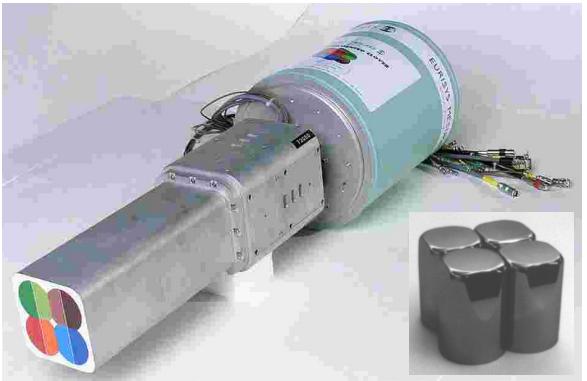

- Physics motivation
 - Nuclear shell evolution across the nuclear chart
 - Nuclear shape coexistence
 - Nuclear triaxiality
 - Superdeformation
 - Astrophysical application
 - Detailed nature of Pygmy dipole and Gamov-Teller resonances
 - Isospin symmetry breaking

EN exp.
campaign

GR exp.
campaign

CAGRA status: Detector Inventory

6 clovers + Compton suppression shields from **Tohoku University**. Inventory from Hyper-Nuclei program at JPARC (T. Koike)

10 clovers + Compton suppression shields come from **CloverShare** in USA. These detectors originally comprised the Yrast Ball at the Wright Nuclear Structure Laboratory – Yale University (V. Werner and R. Casten).

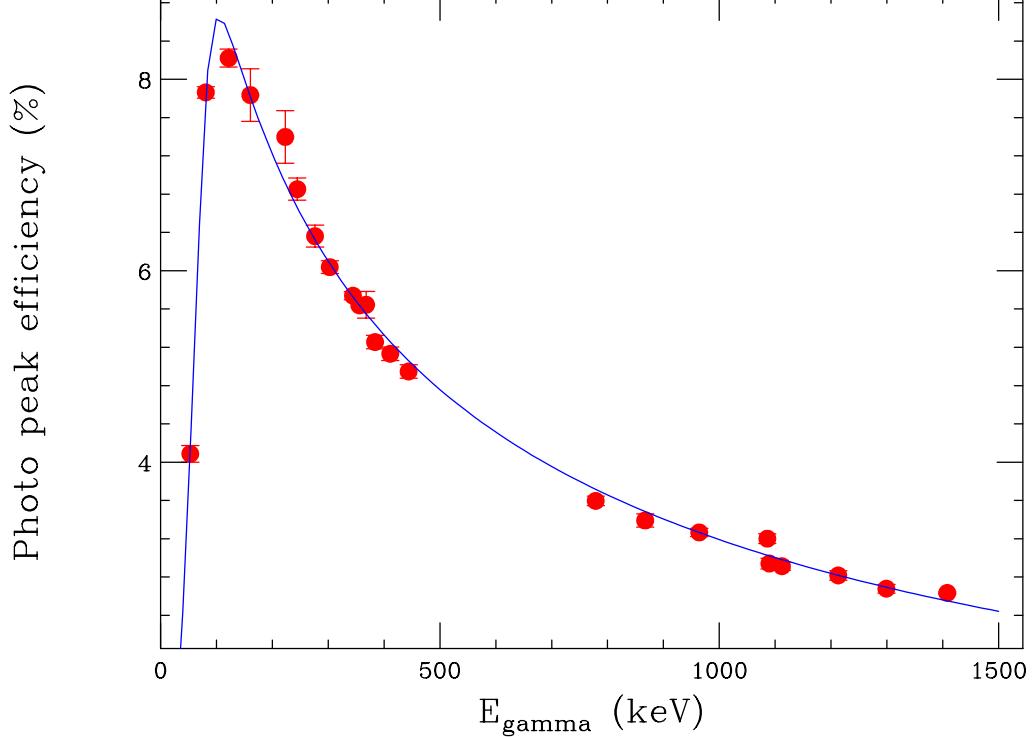

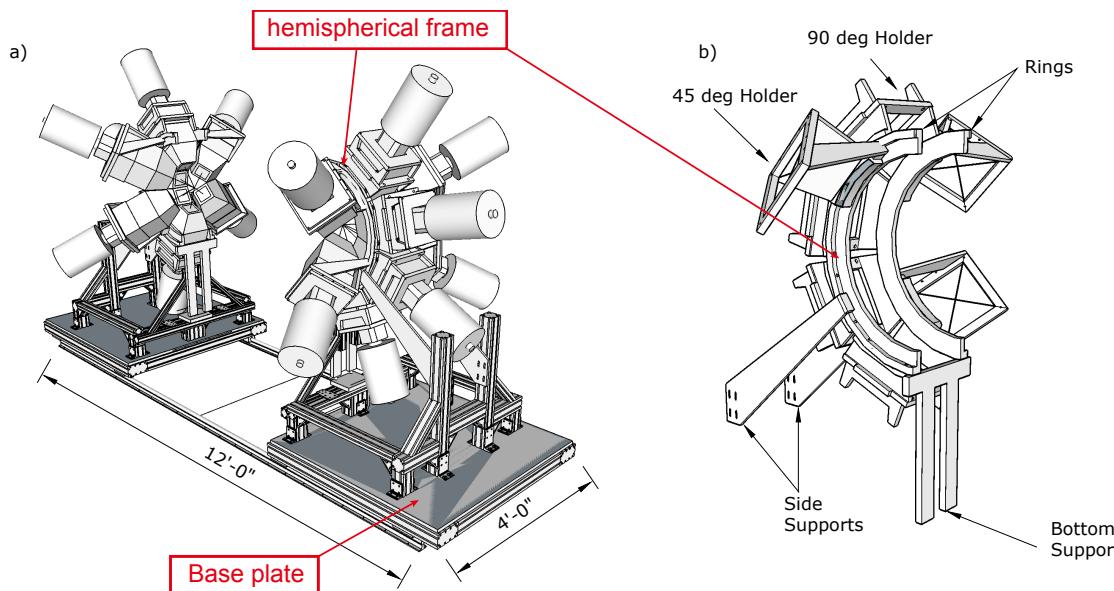

2 Clovers from ARL (Jeff. Carroll)

3 EXOGAM type Clover Detectors from **IMP**, China

4 Large volume LaBr₃ detectors from **Milano**: 3.5" ϕ -8" L

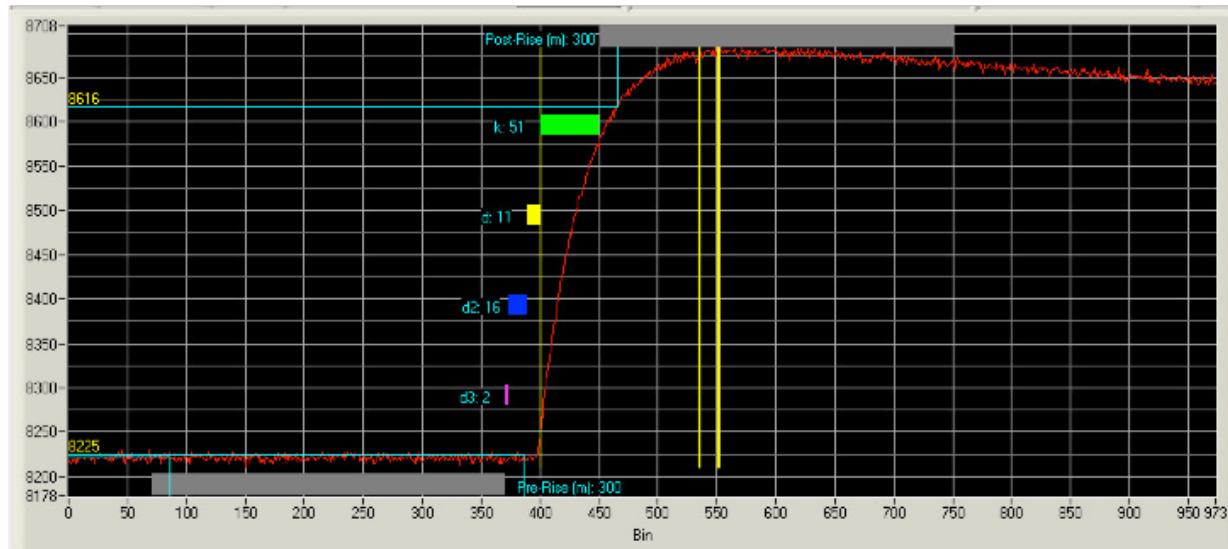

CAGRA specification

- 16 Compton suppressed Clover Ge detectors
 - 4 detectors at 45°
 - 8 detectors at 90°
 - 4 detectors at 135°
- Target – Ge : 202mm
- $\varepsilon_{ph}(1\text{MeV}) \sim 3\%$

Campaign at RCNP-EN beam line

RCNP Exotic Nucleus beam line using Heavy Ion Beams

T. Shimoda et al., NIM B70 (1992) 320.

S. Mitsuoka et al., NIM A372 (1996) 489.

RI beam with beam energy from low (\sim a few MeV/u) to high (\sim several tens MeV/u) can be delivered.

Maximum rigidity	3.2 Tm
Energy acceptance	$\Delta E/E = 16 \%$
Angular acceptance	$\Delta\theta = 40 \text{ mrad}$ $\Delta\phi = 28 \text{ mrad}$
Path length	16.8 m

Experiments at EN beam line

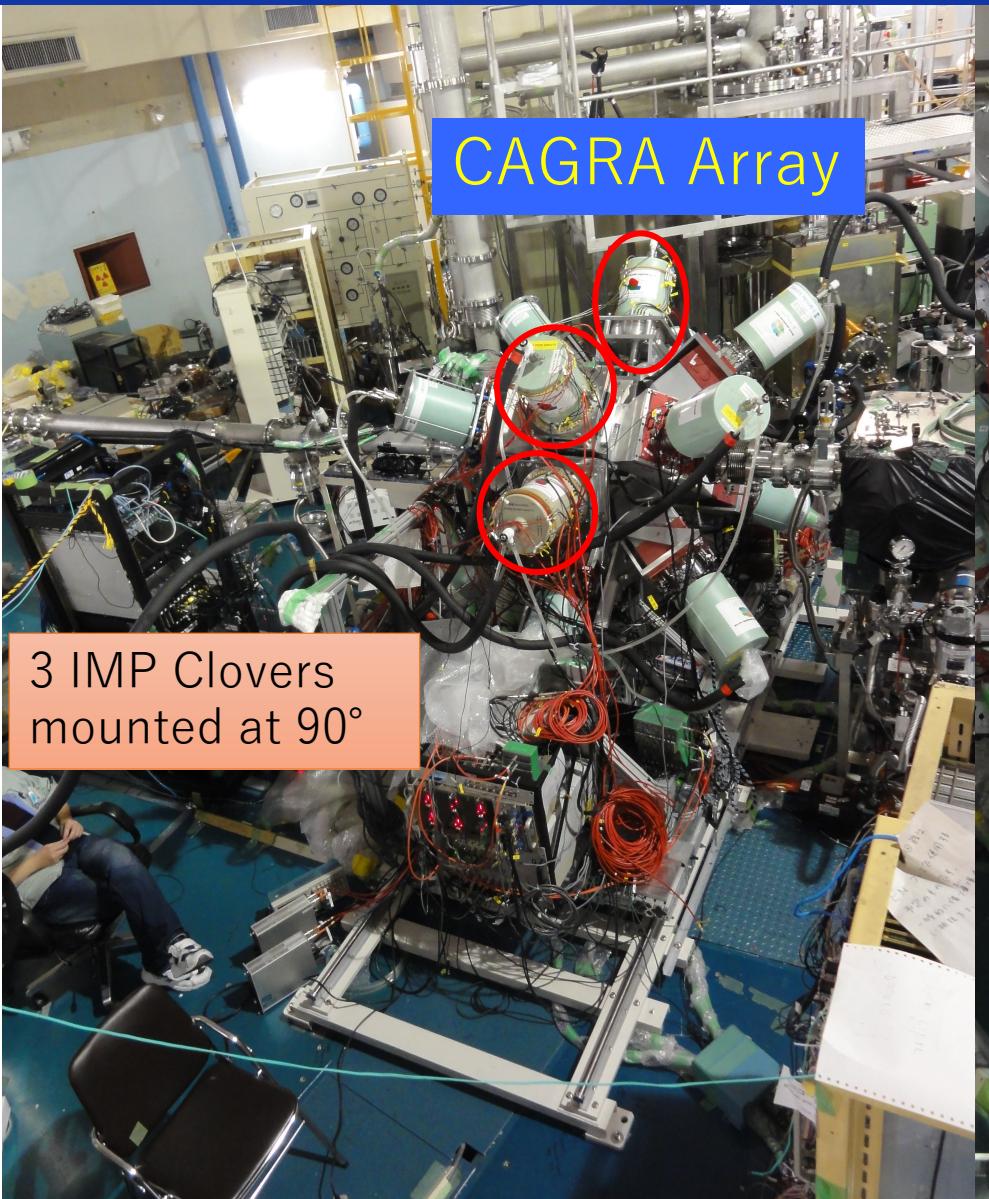

Experiments using stable beam

1. Study of superdeformed structure in ^{44}Ti , ^{45}Sc (E438: E. Ideguchi, RCNP)
2. Structure of excited states above the long-lived ($T_{1/2} \sim 1.5 \times 10^5 \text{y}$),
 $K^\pi = 8^+$ isomer in ^{186}Re (E435: F.G. Kondev, ANL)

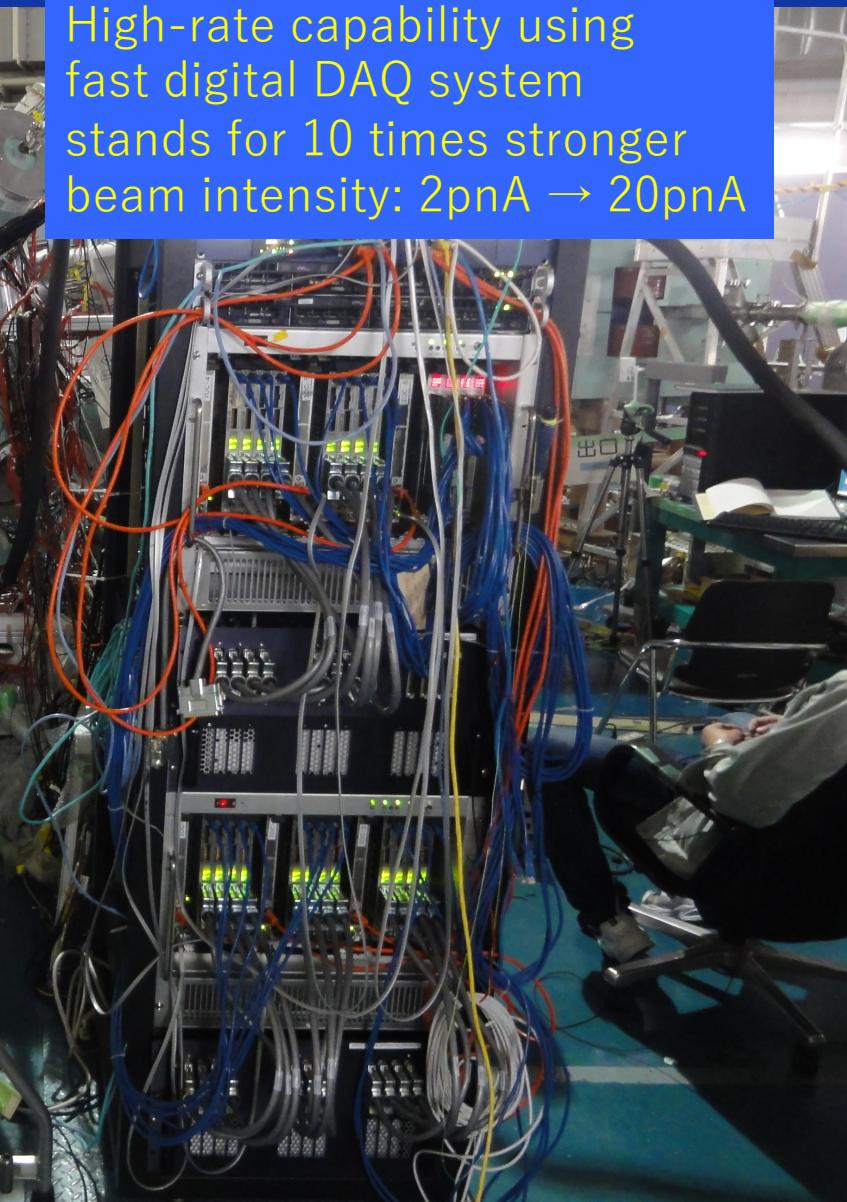

Experiments using unstable beam

1. Probing High-Spin States in $^{61,62}\text{Fe}$ Using the $^{48}\text{Ca}(^{17}\text{N},\text{pxn})$ Reaction
(E436: M.P. Carpenter, ANL)
2. Study of High-Spin States by RI Beam Induced Fusion Reaction
(E448: A. Odahara, Osaka)
3. Study of shell evolution at N=20 in neutron-rich region through nucleon transfer reaction (E439: T. Yamamoto & N. Aoi, RCNP)
4. Spectroscopy of ^{15}B : A search for unexpected bound states
(E437: C.R. Hoffman, ANL)

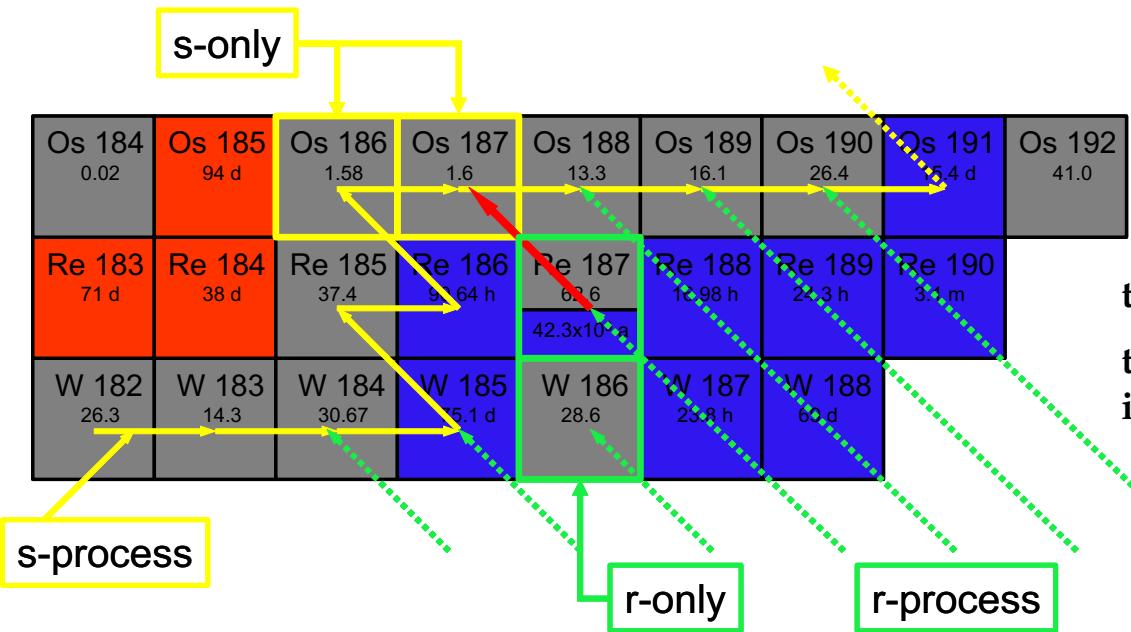

CAGRA campaign experiments at EN beam line

High-rate capability using fast digital DAQ system stands for 10 times stronger beam intensity: $2\text{pnA} \rightarrow 20\text{pnA}$

Structure of excited states above the long-lived ($T_{1/2} \sim 2.0 \times 10^5$ y), $K^\pi = 8^+$ isomer in ^{186}Re

$^{187}\text{Re}-^{187}\text{Os}$ cosmochronometer can be used to date the r-process

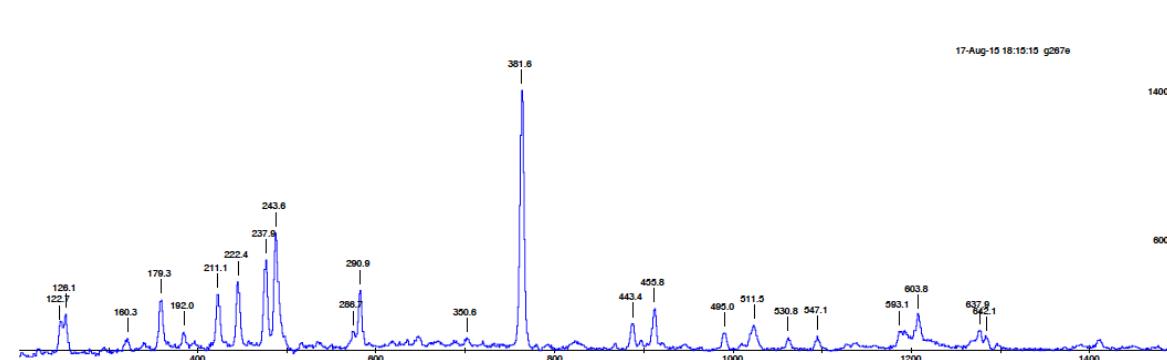

D.D. Clayton, Ap.J. 139 (1964) 637.

the existence of long-lived isomeric state
the production & destruction CS for the isomer are poorly known, but badly needed!

^{186m}Re could contribute to the production of ^{187}Re in s-process nucleosynthesis

$^{186}\text{W}(d,2n)$

- ✓ at Osaka U & CAGRA
- ✓ $\gamma-\gamma$ coin. at 14 MeV – identification of structures above the very long-lived $K^\pi=8^+$ isomer ^{186}Re

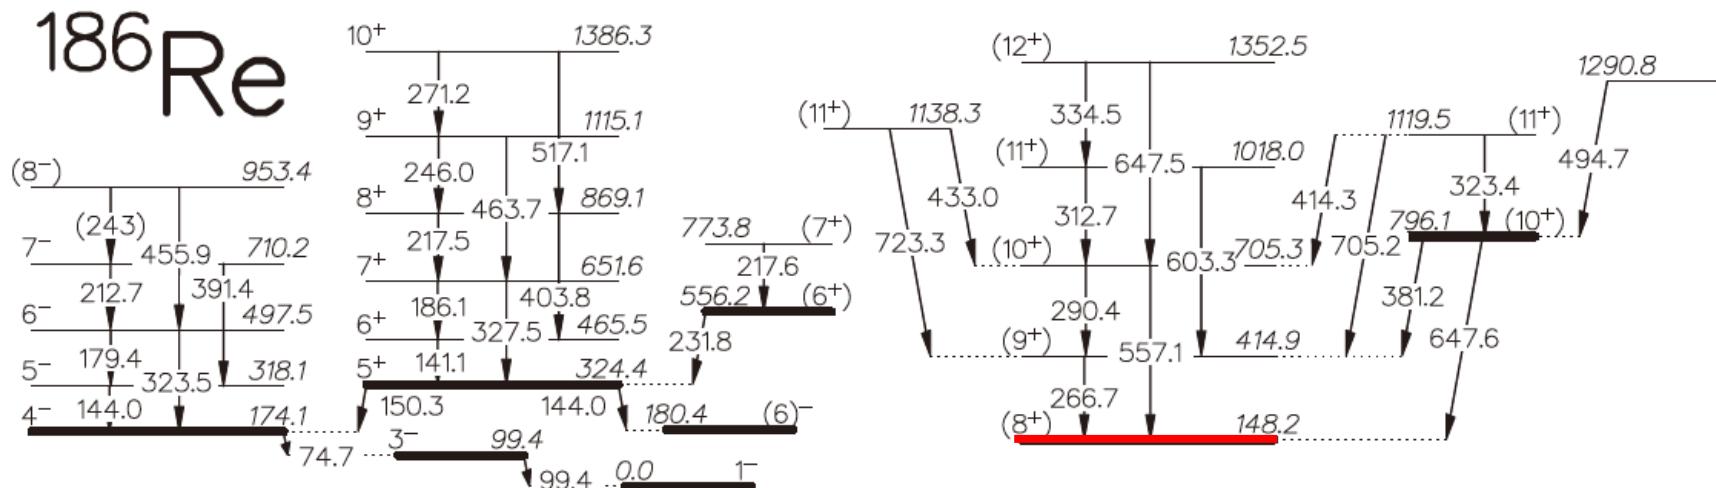

gamma rays above the $K^\pi=8^+$ isomer

Recent CAGRA result

E439

Study of shell evolution at $N=20$ in neutron-rich region through nucleon transfer reaction

Spokes person : Tetsuya Yamamoto (RCNP), Nori Aoi(RCNP)

Beam Time - 2015/05/02 ~ 2015/05/10

Purpose

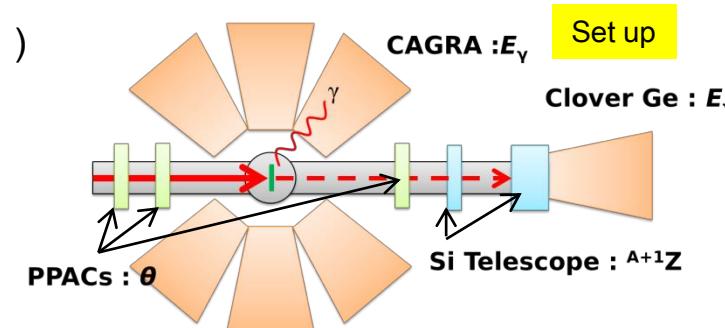

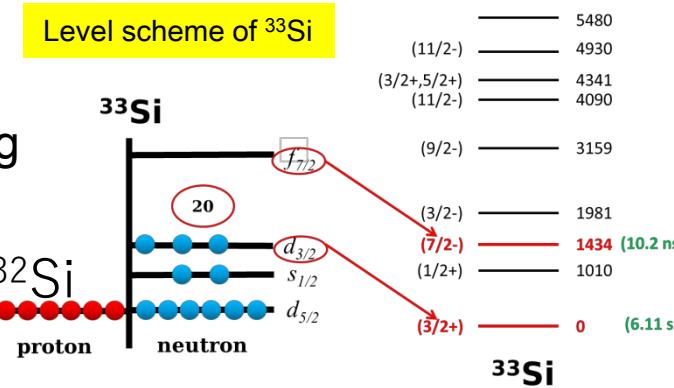

- ◆ Study of the mechanism of shell evolution around $N=20$ neutron rich region.
 - Measurement of the $N=20$ ($f_{7/2}$ - $d_{3/2}$) neutron shell gap.
 - We choose ^{29}Mg , ^{31}Mg , ^{33}Si which are locating across the “island of inversion”.
- ◆ Study of proton and neutron collectivity in

Experiment

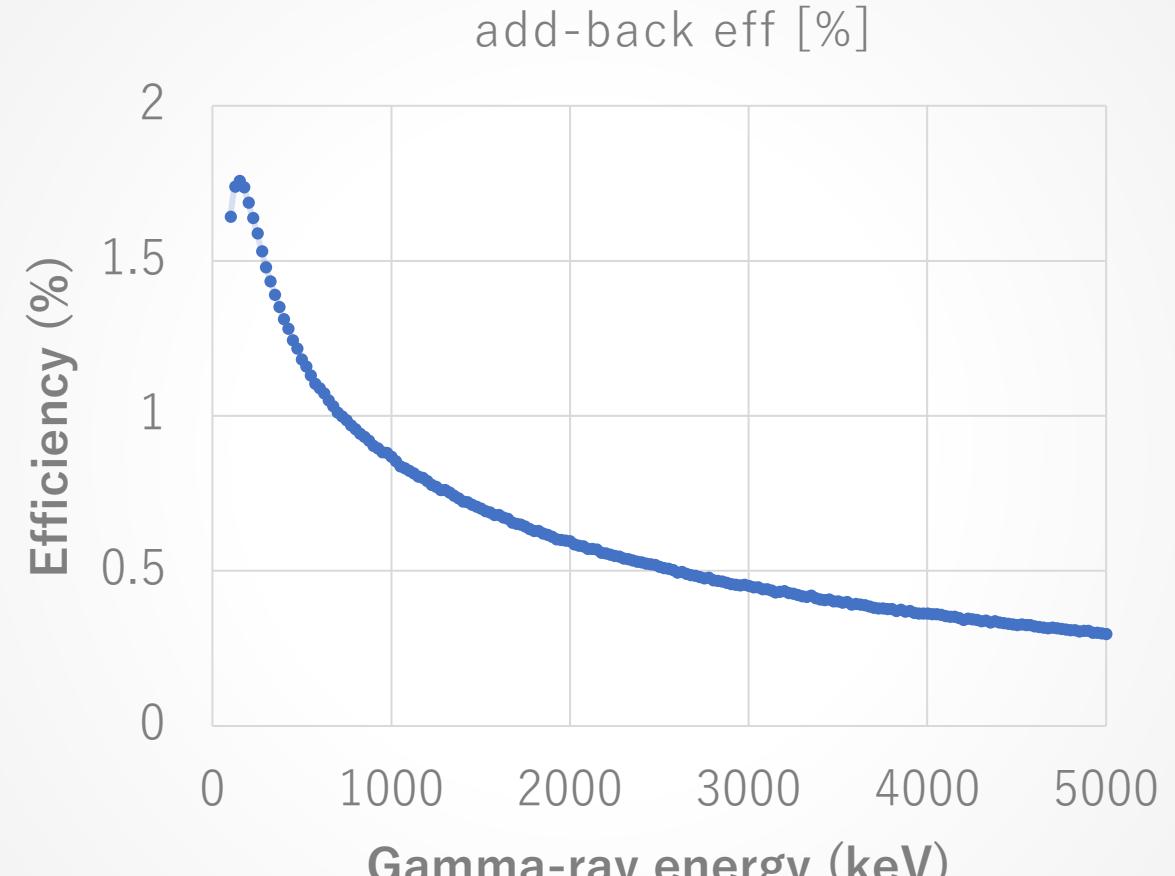

- ◆ Beam : (primary) ^{40}Ar , (secondary) $^{28,30}\text{Mg}$, ^{32}Si
- ◆ Reaction : $^{28}\text{Mg}(d,p)^{29}\text{Mg}$, $^{30}\text{Mg}(d,p)^{31}\text{Mg}$, $^{32}\text{Si}(d,p)^{33}\text{Si}$, $^{32}\text{Si}(d,d')^{32}\text{Si}$
- ◆ Measurement : θ_{sc} , γ (especially $7/2^- \rightarrow 3/2^+$)

E_{ex} , $d\sigma/d\Omega$, J^π , S_f

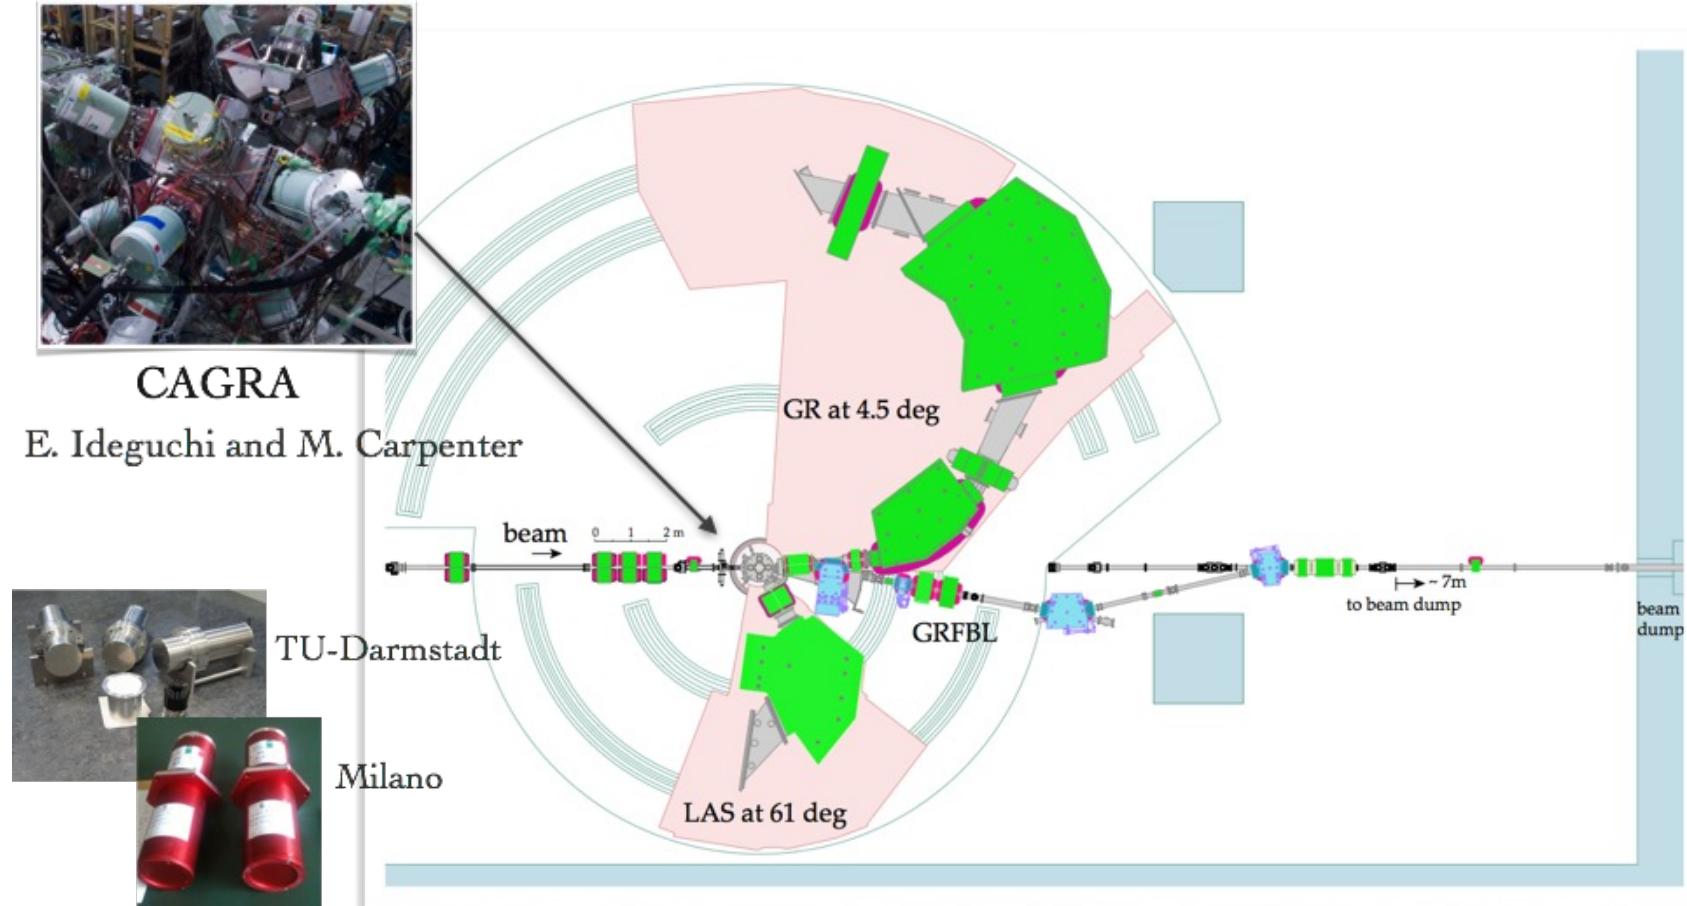

GAGRA (Clover Ge's with Gretina Quad Ge)

CAGRA-Grand Raiden Campaign at RCNP

Purpose: To perform high-resolution coincident measurements between reacting light-ions (Grand Raiden) and de-excitation γ -rays (CAGRA).

RCNP, Tohoku, ANL, LBNL, Milano, TU-Darmstadt, GSI, Köln, KVI, IFJ-PAN, IMP, York, ARL, ...

CAGRA+GR Campaign Exps. in Oct-Dec 2016

Physics Motivation

Where is the limit of nuclear stability?

Predicted single-particle structure in transuranium region

$\pi j_{15/2}$, $\pi f_{5/2}$ orbitals are important for $Z=114, 126$ shell gap
 $\nu h_{11/2}$, $\nu k_{17/2}$ for $N=184$ gap

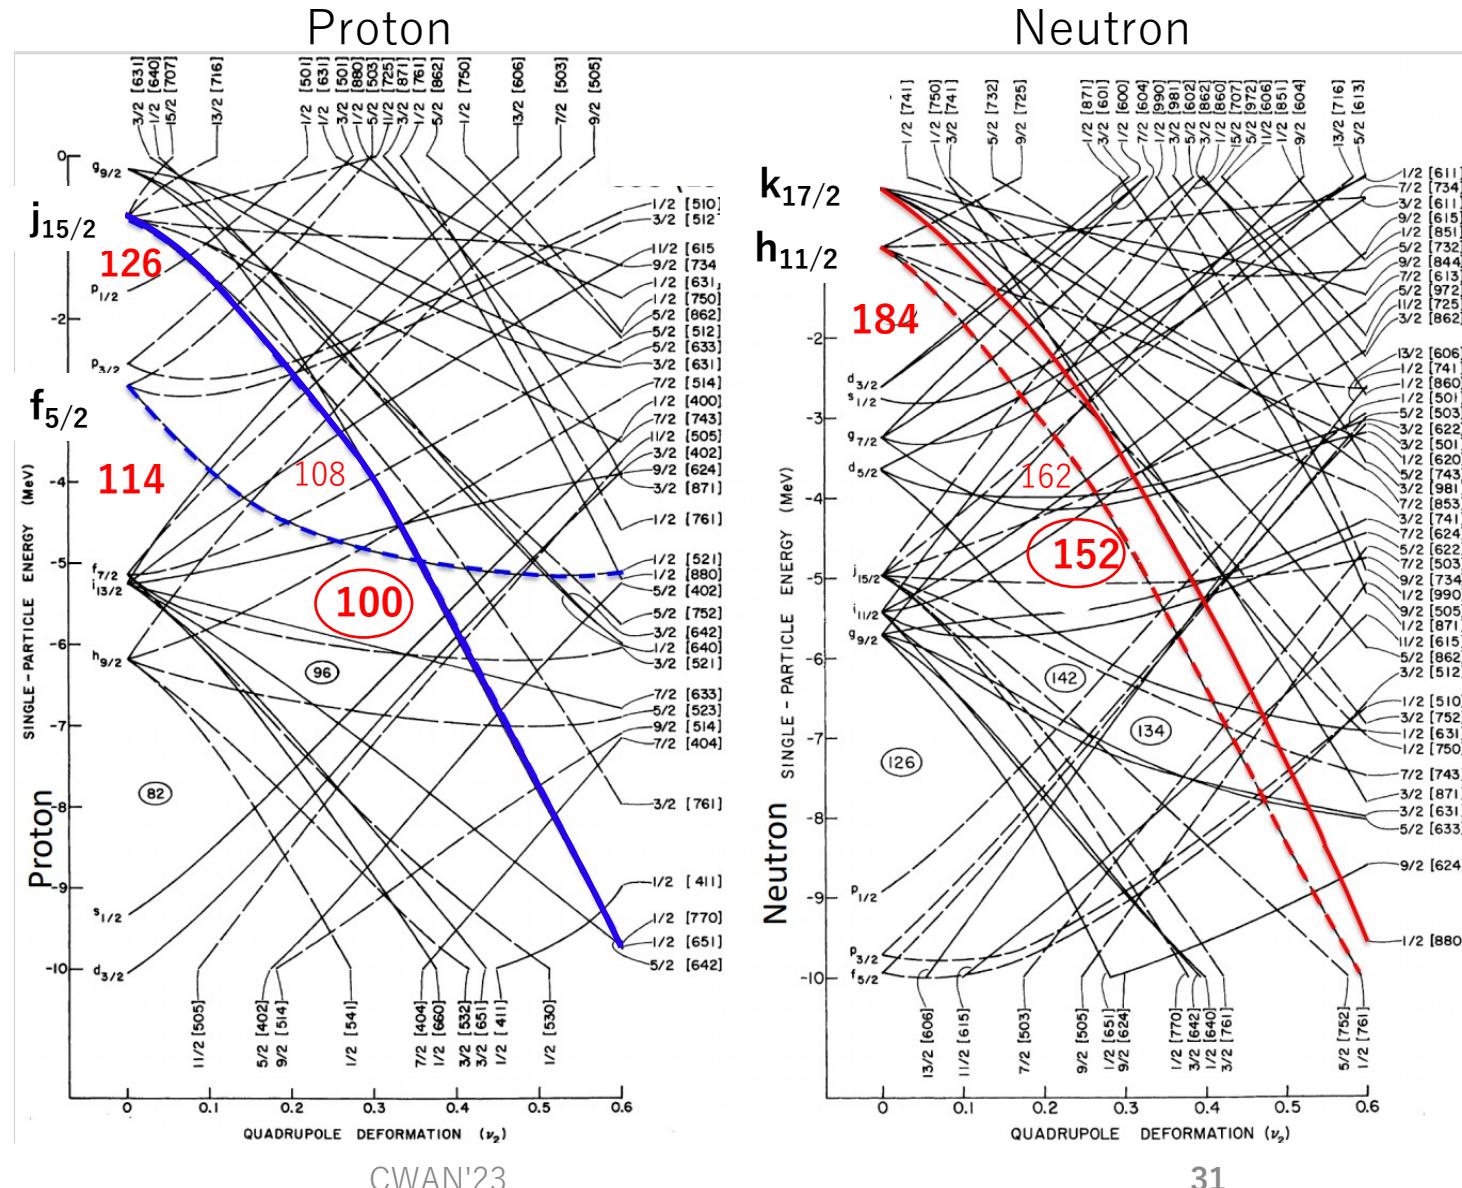

Deformed shell gap at $Z=100, N=152$

$\pi j_{15/2}$, $\pi f_{5/2}$, $\nu h_{11/2}$, $\nu k_{17/2}$ orbits are going down in the deformed region

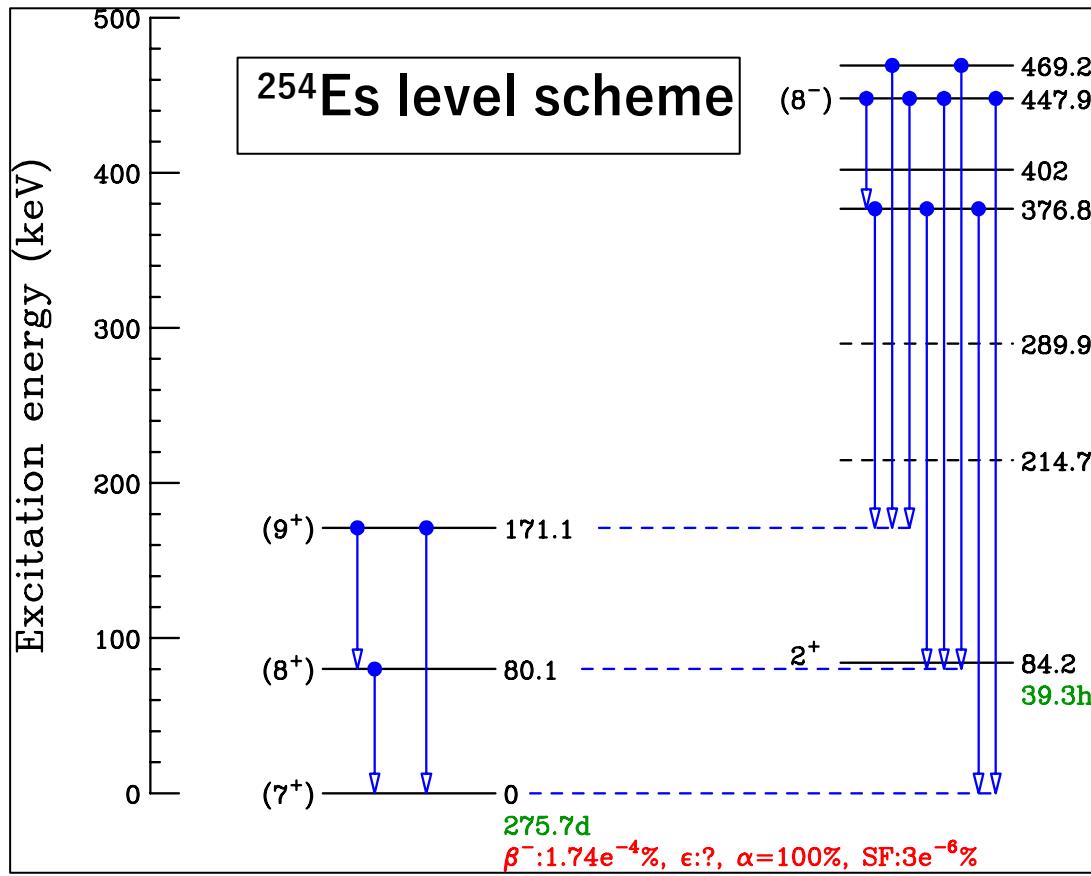

Studies of excited states and deformation will be useful to understand the shell structure

^{254}Es Target Coulomb excitation

K.J. Moody et al., Nucl. Phys. A 563, 21-73 (1993).

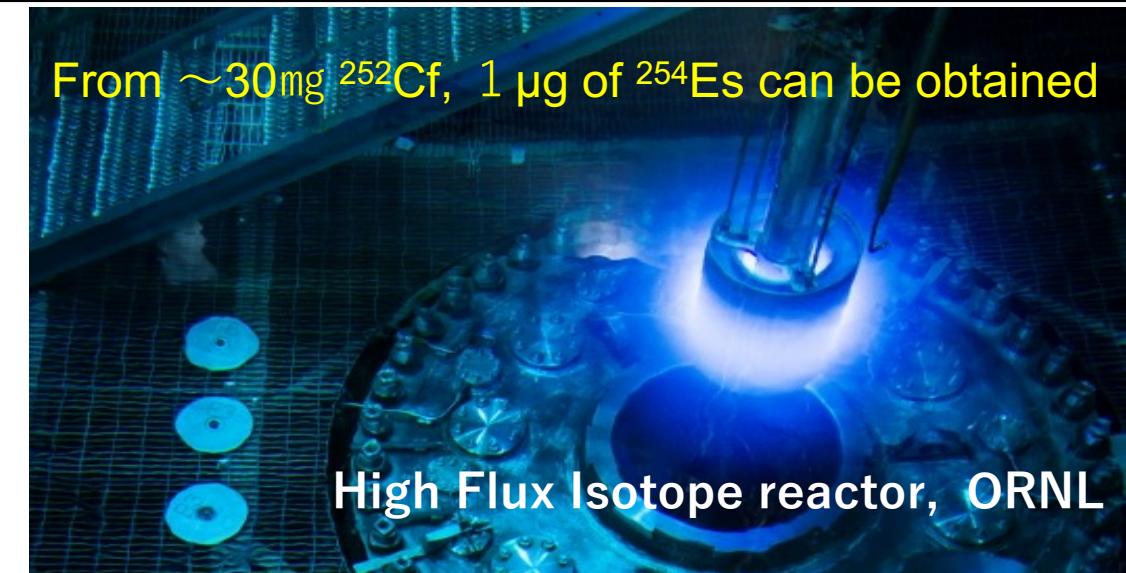

^{254}Es produced at High Flux Isotope Reactor at Oak Ridge National Lab, USA.

Performed in JAEA Tandem accelerator, Tokai, Ibaraki

Beam : $^{58}\text{Ni} - 250\text{MeV}$

Target : $^{254}\text{Es} \sim 3\mu\text{g}/\text{cm}^2$

Backing & cover : $^{nat}\text{Ni} - 300\mu\text{g}/\text{cm}^2$ both side

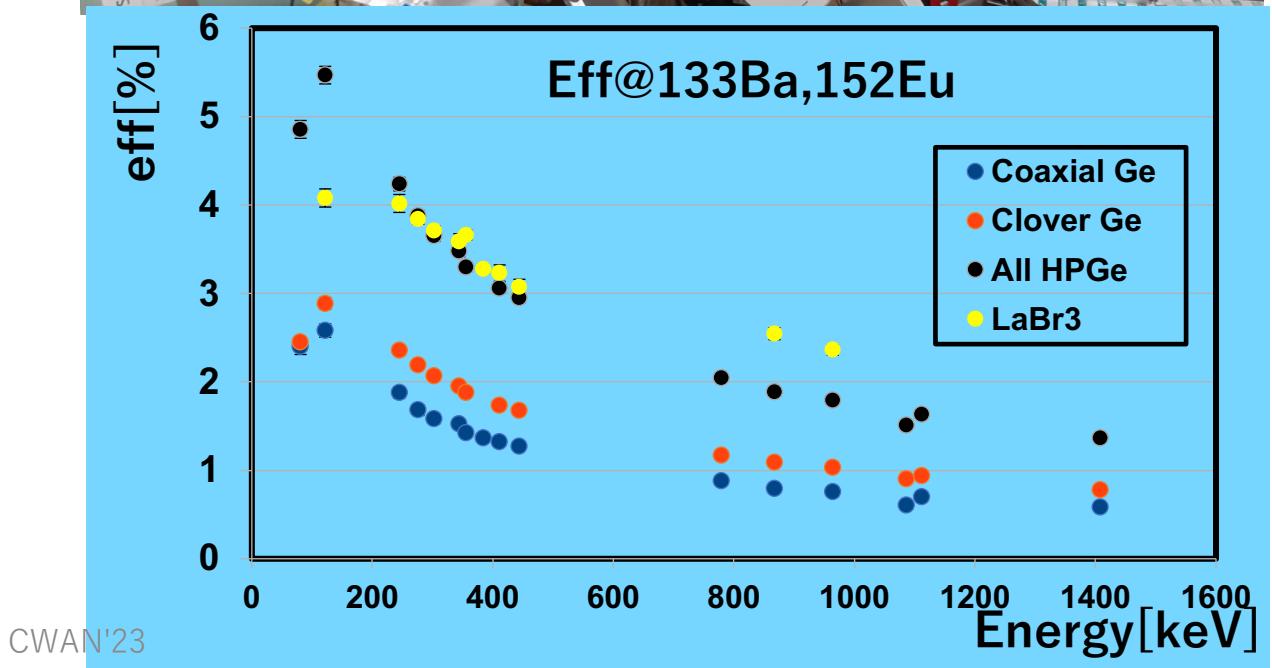

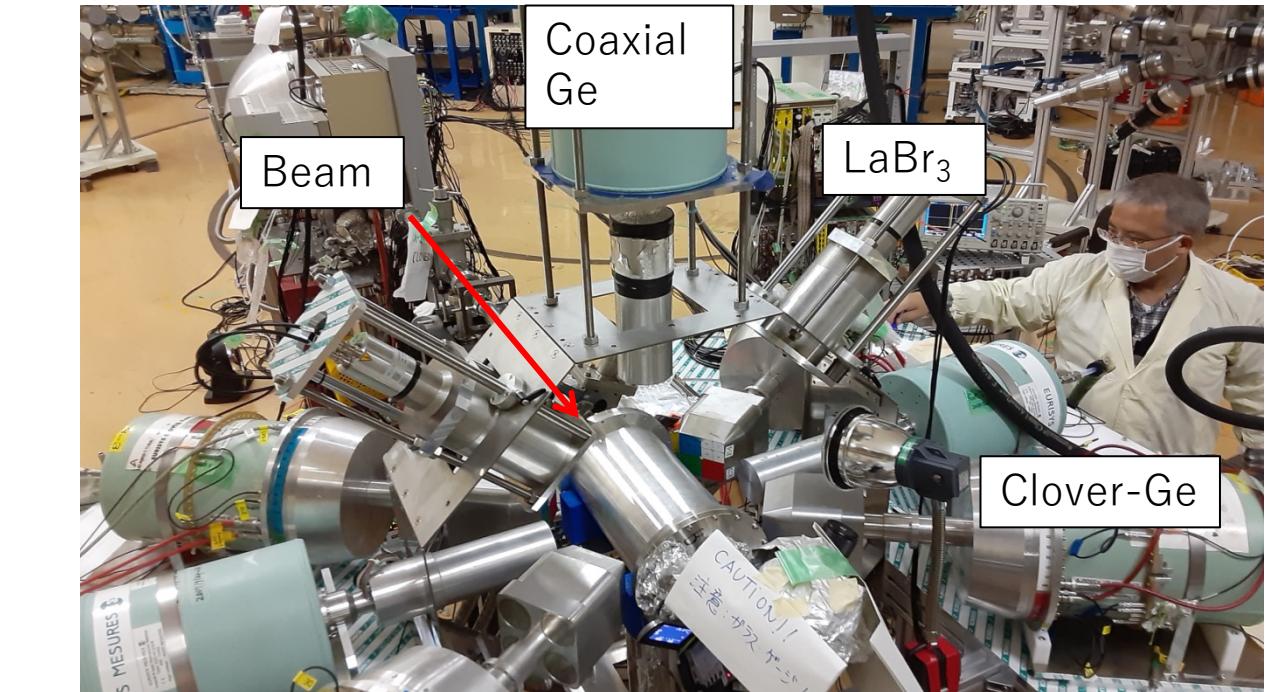

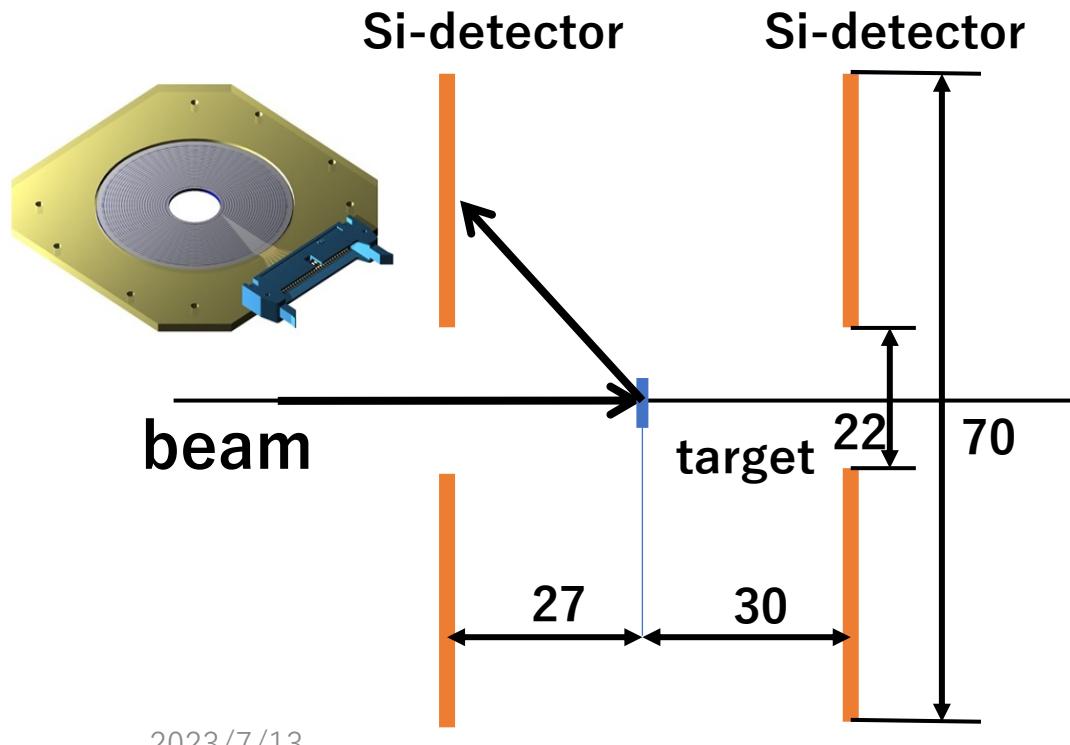

^{254}Es target

Target prepared at JAEA
using $\sim 0.1\mu\text{g}$ ^{254}Es
Activity $\sim 4.5\text{ MBq}$

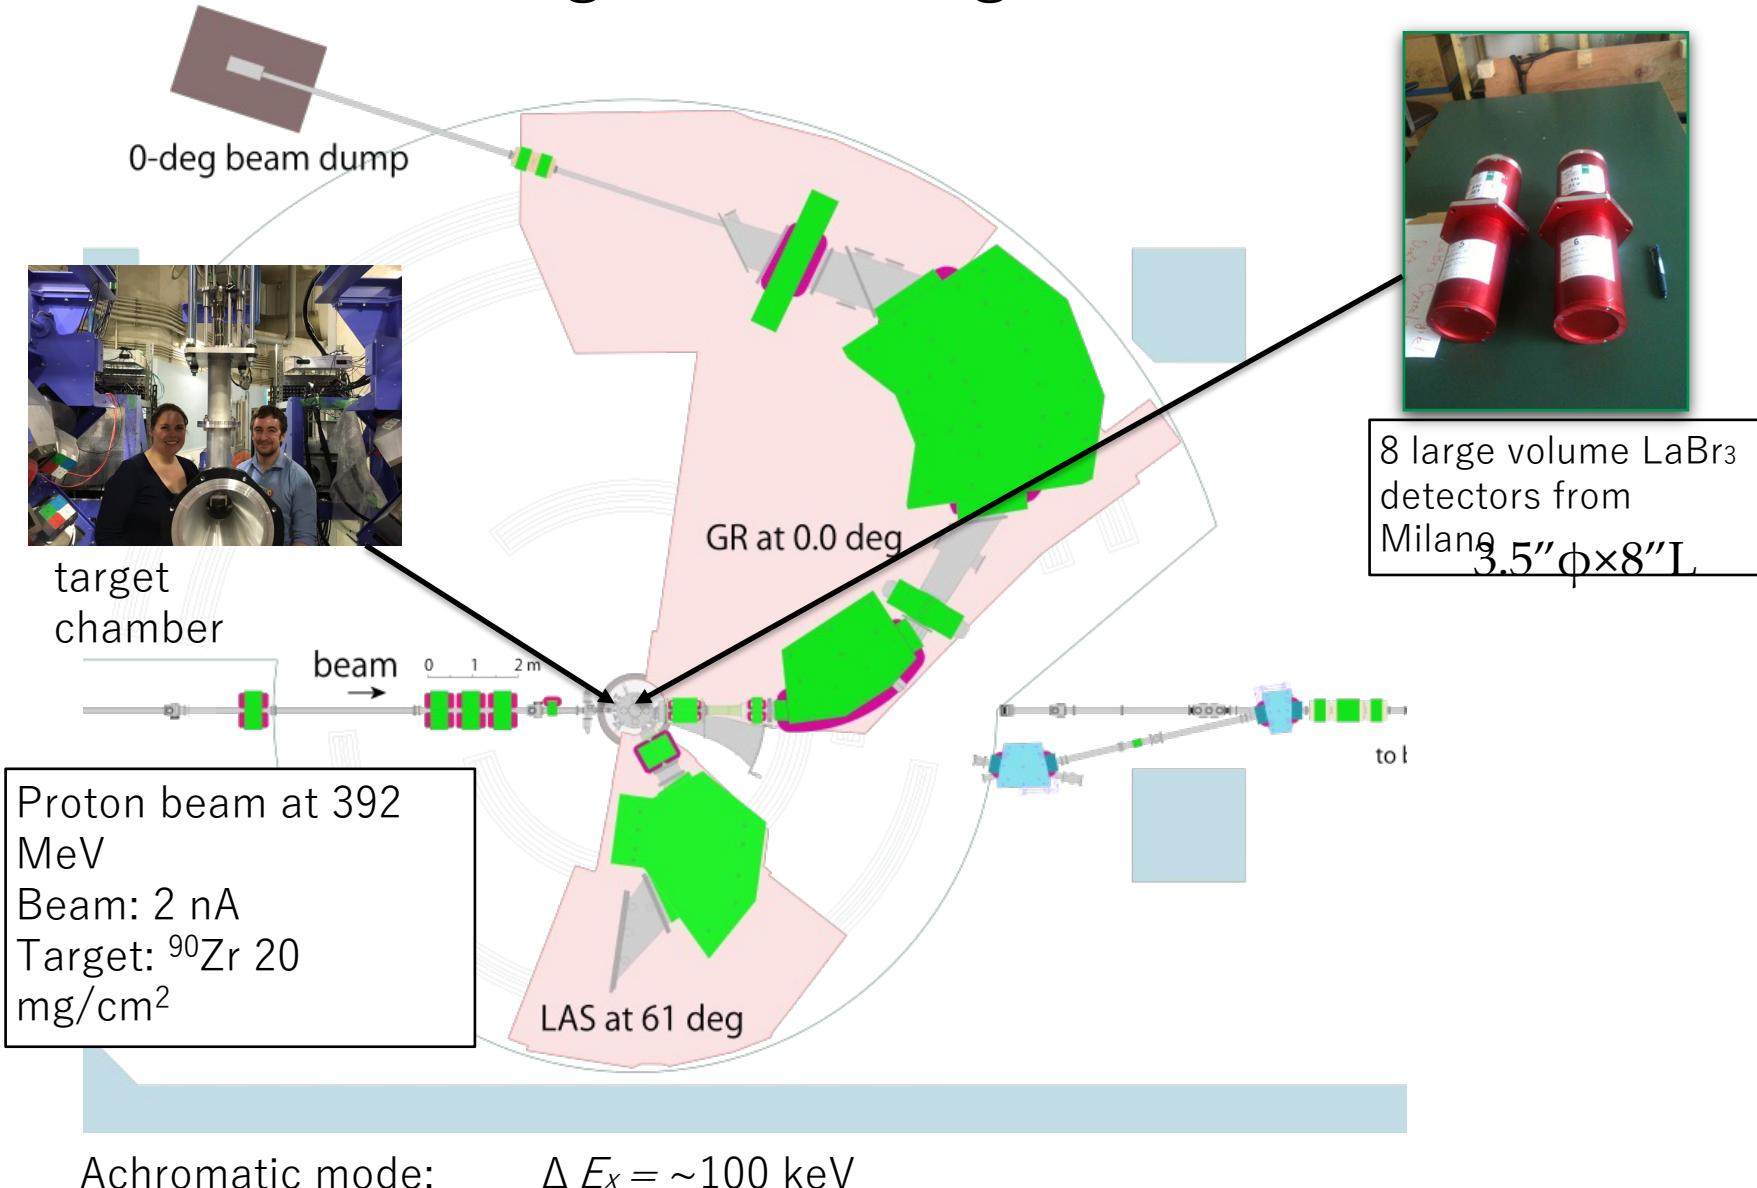

Detector System

Silicon Detectors – 24 rings
Backward
Coverage angle : **127° – 157°**
Forward
Coverage angle : **20° – 49°**

E498: Experimental Methods

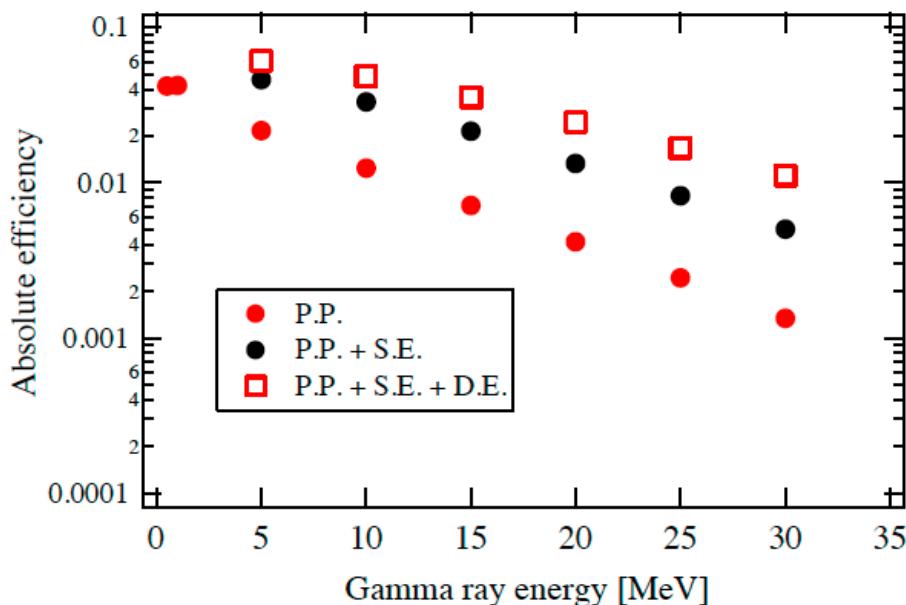

GR 0-deg mode + large volume LaBr₃

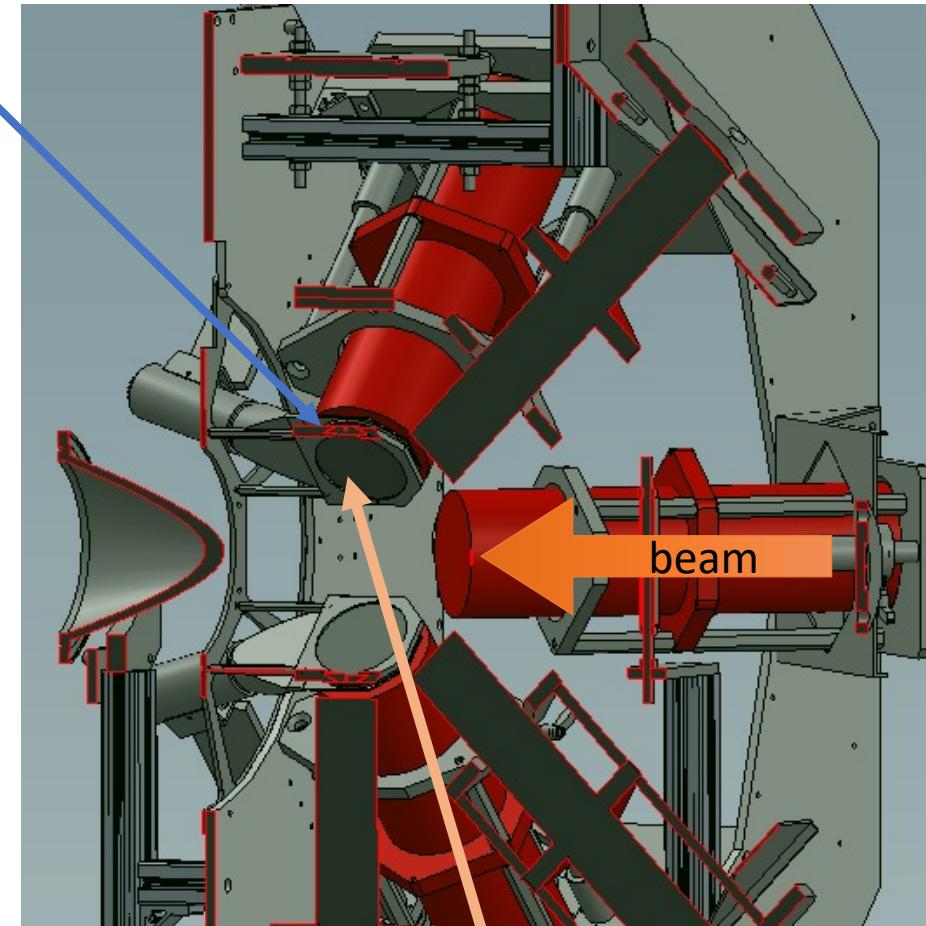

Gamma ray detector array

Plastic (2mm^t) for charged particle veto

Total Number of detectors	8
Detectors at 90'	4
Detectors at 135'	4
Distance from target	135 mm
Solid angle	20% of 4pi
Efficiency @ 15MeV	4% (PP+SE+DE)

Scylla

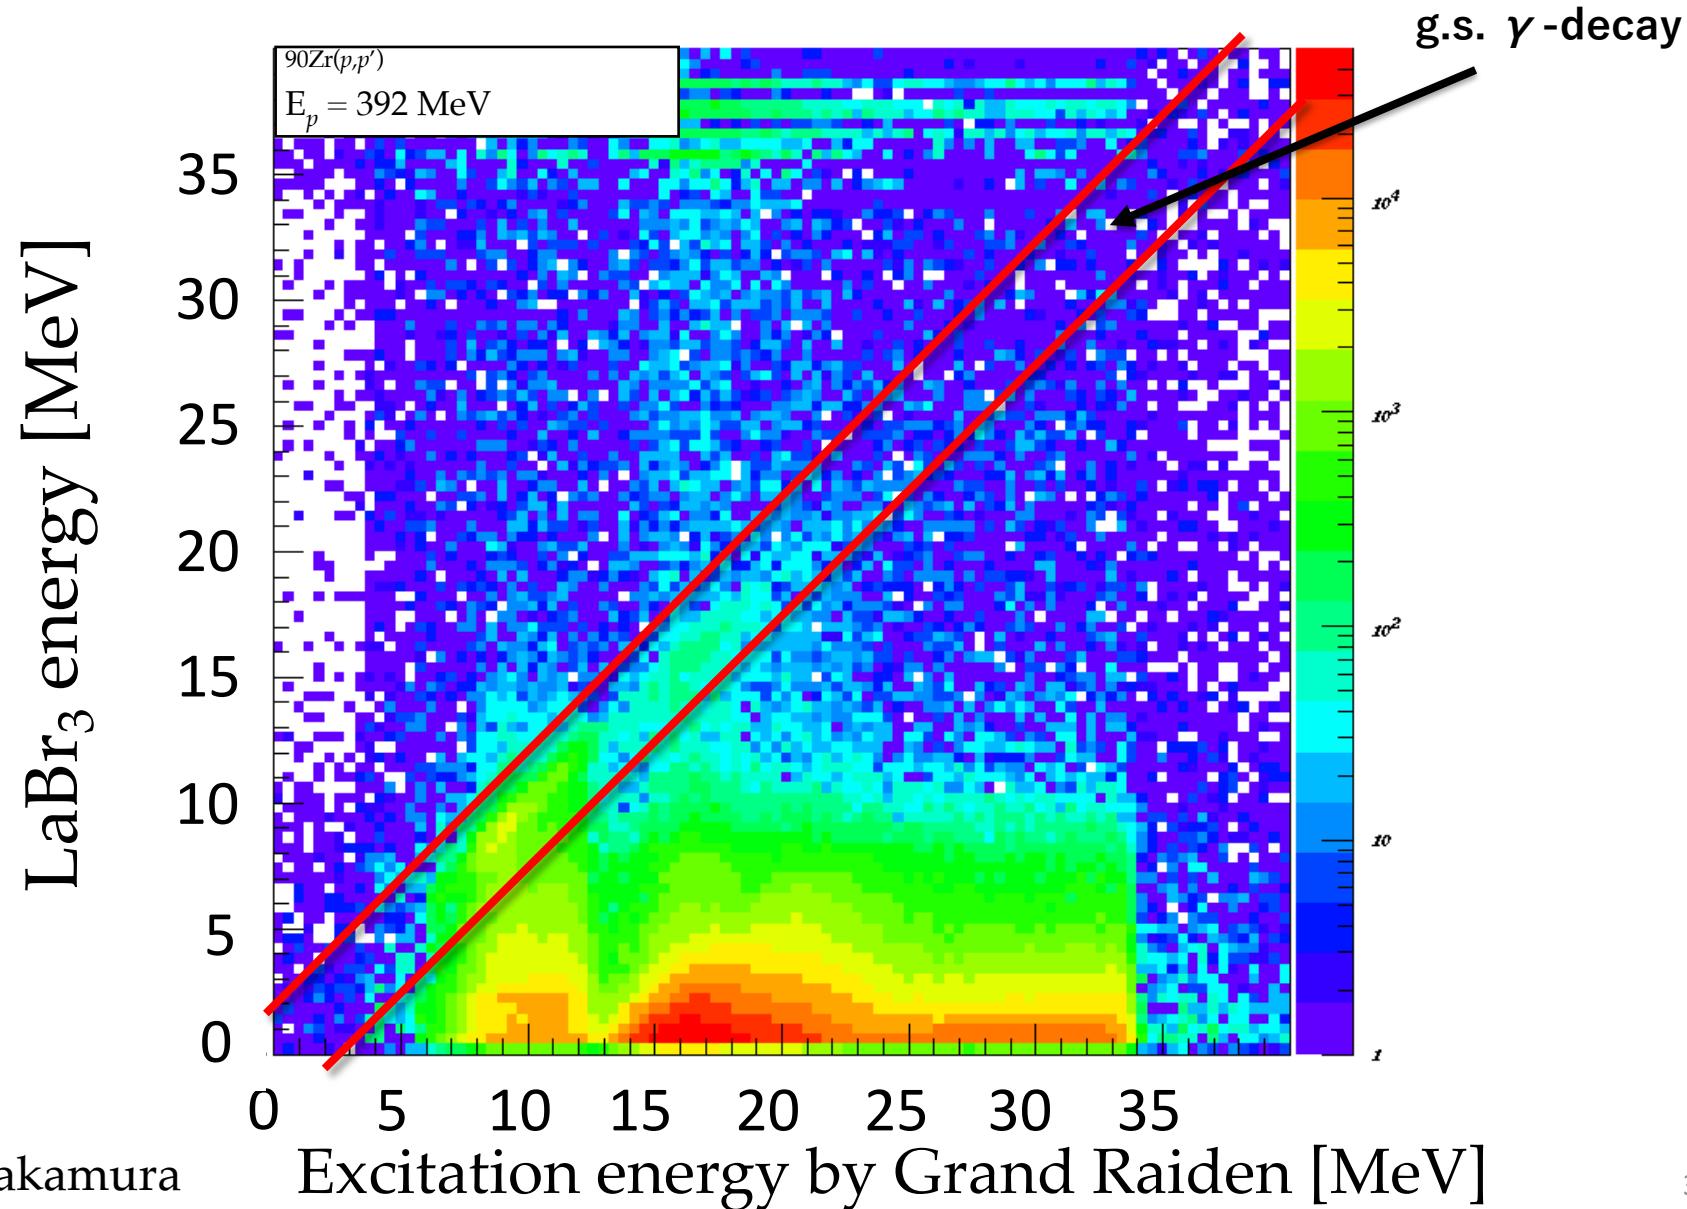

Pb(2mm^t) and Cu(4mm^t) absorber for low energy gammas

by S. Nakamura

Coincidence matrix of Grand Raiden and LaBr₃

means the ground state gamma decay

Summary

- CAGRA project → gamma-ray spectroscopy at RCNP
 - International collaboration: RCNP-Tohoku-ANL-ARL-IMP-Milano...
 - CAGRA campaign experiments at EN and Grand Raiden
 - CAGRA at JAEA
 - Gamma-ray spectroscopy of Actinoid
 - CAGRA including Gretina Quad detector available
- LaBr₃ array at Grand Raiden: Scylla
 - Particle-gamma coincidence measurements
