4D-TExS: A new 4D lattice-QCD equation of state with extended density coverage

mardi 4 juin 2024 08:50 (20 minutes)

Although calculations of QCD thermodynamics from first-principle lattice simulations are limited to zero netdensity due to the fermion sign problem, several methods have been developed to extend the equation of state (EoS) to finite values of the B, Q, S chemical potentials. Taylor expansion around $\mu_i = 0$ (i = B, Q, S) enables to cover with confidence the region up to $\mu_i/T < 2.5$. Recently, a new method has been developed to compute a 2D EoS in the (T, μ_B) plane. It was constructed through a T-Expansion Scheme (TExS), based on a resummation of the Taylor expansion, and is trusted up to densities around $\mu_B/T = 3.5$. We present here the new 4D-TExS EoS, a generalization of the TExS to all 3 chemical potentials, offering a larger coverage than the 4D Taylor expansion EoS. After explaining the basics of the T-Expansion Scheme and how it is generalized to multiple dimensions, we will present results for thermodynamic observables as functions of temperature and all chemical potentials.

Auteur principal: Dr JAHAN, Johannes (University of Houston)

Co-auteurs: M. ABUALI, Ahmed (University of Houston); PASZTOR, Attila (Eötvös Loránd University, Budapest); RATTI, Claudia (University of Houston); M. SHAH, Hitansh (University of Houston); M. KAHANGIRWE, Micheal (University of Houston); Dr PAROTTO, Paolo (Università di Torino); M. TRABULSI, Seth A. (University of Houston); Dr BORSÁNYI, Szabolcs (Bergische Universität Wuppertal)

Orateur: Dr JAHAN, Johannes (University of Houston)

Classification de Session: Track4-Bulk&Phase

Classification de thématique: Bulk matter phenomena, QCD phase diagram and Critical point
