Ionisation of a single nanoparticle by heavy Cosmic Ray

jeudi 26 octobre 2023 17:00 (30 minutes)

The interstellar medium is made up of gas and dust. This medium is traversed by cosmic radiation and irradiated by stellar UV, except in dense clouds where UV is absent. The interaction of these rays with the dust and gas is crucial to the chemical evolution of interstellar and circumstellar environments. Heavy and slow cosmic rays interact with very small dust particles (~100 atoms) and multi-fragment them by coulombic explosion, enriching the gas phase with complex molecules (Chabot, M et al. 2019). The upper limit in dust size for which multifragmentation occurs is currently unknown. The NanoCR experiment aims to provide physics inputs to determine the coulombic explosion size limit. To do this, the charge state distributions of model nanoparticles in single collision with a sample of heavy ions are measured. The experimental set-up will be presented along the initial results on the collision between 100 nm nanoparticles and Argon ions between 1.5 and 15 MeV.

Auteurs principaux: Dr DARTOIS, Emmanuel (ISMO); Dr CHABOT, Marin (IJCLab); Dr SUBLÉMONTIER, Olivier (NIMBE); NGUYEN TRUNG, Thibault (IJCLab)

Orateur: NGUYEN TRUNG, Thibault (IJCLab)

Classification de Session: Astroparticle

Classification de thématique: Astroparticle
