Star formation

molecular cloud core

Kaho Morii

- Core to star formation efficiency of ~ 30-50%
- Core mass more than $\gtrsim 30 M_{\odot}$ and high mass accretion rate ($10^{-3} M_{\odot} \text{ yr}^{-1}$) are required to form high-mass stars ($> 8 M_{\odot}$).
 - Student Fest by SGU-PG

Star formation

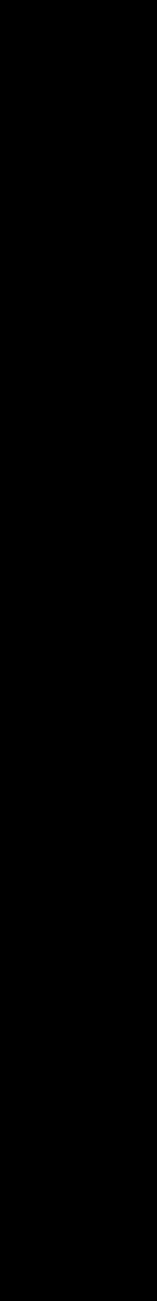

Prestellar core

Kaho Morii

Protostellar core

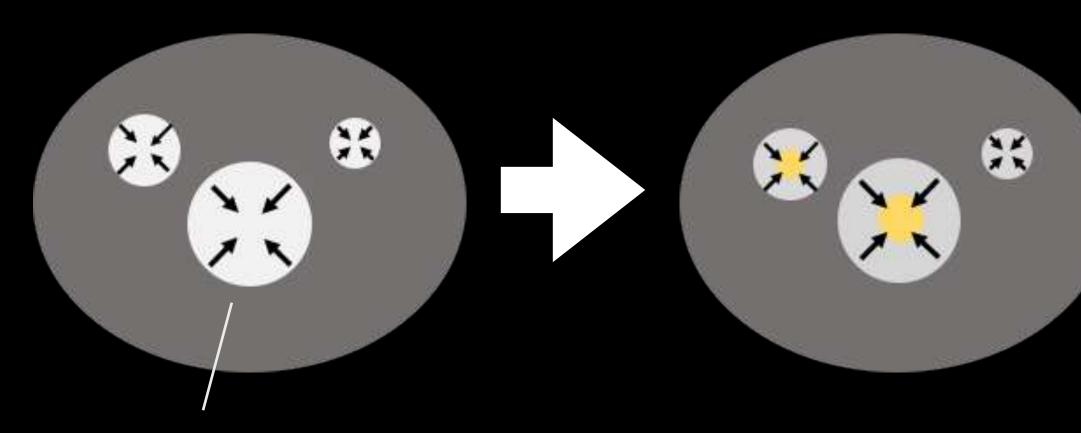

Q: How to form such a high-mass core? Q: Do high-mass "prestellar" cores exist?

Student Fest by SGU-PG

High-mass star formation scenario

Core-fed accretion scenario High-mass prestellar core supported by strong turbulence or magnetic field

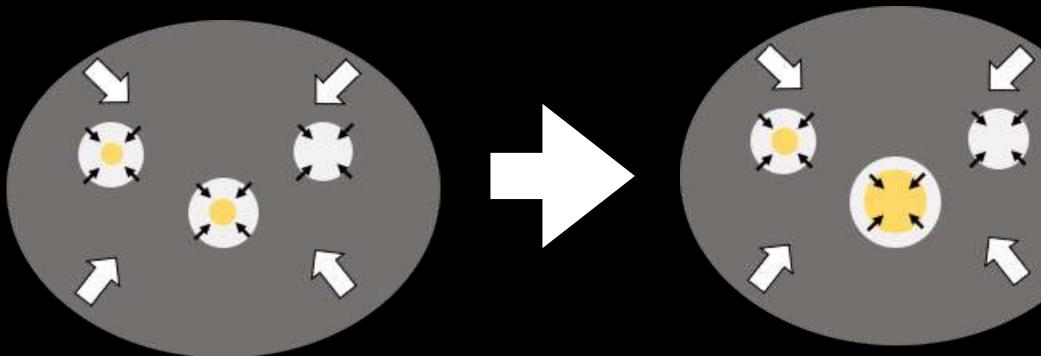

A high-mass prestellar core

Kaho Morii

Clump-fed accretion scenario

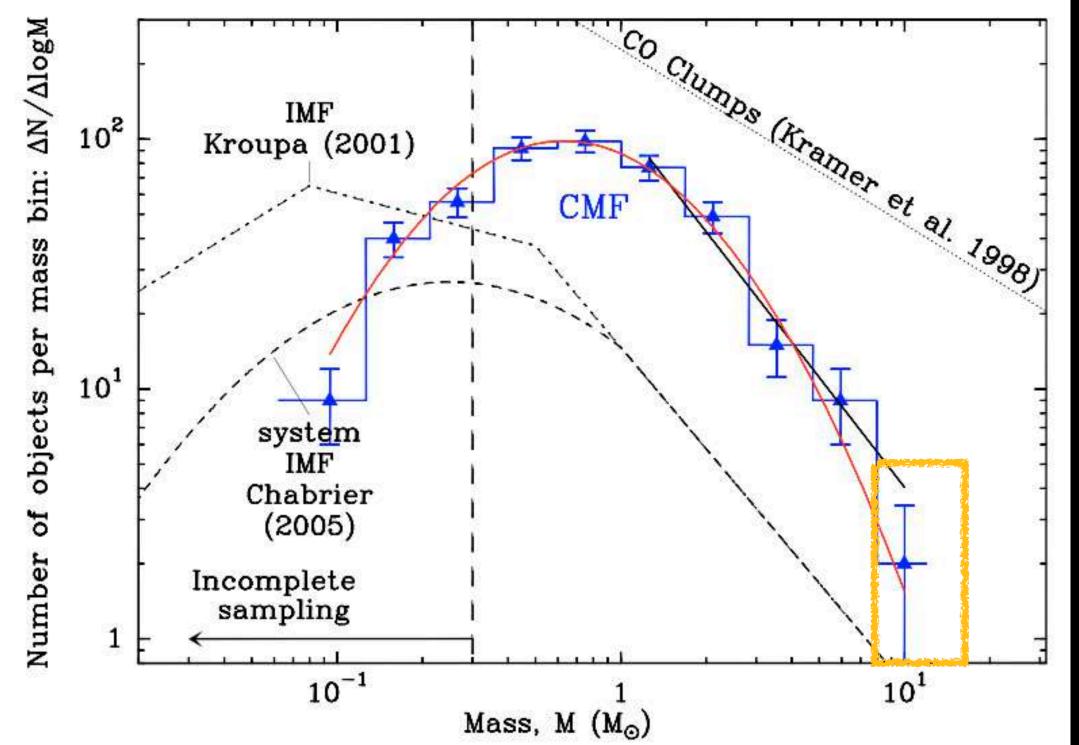

Initially low- to intermediate-mass cores that grow in mass through gas feeding to form high-mass protostar

The rarity of high-mass stars

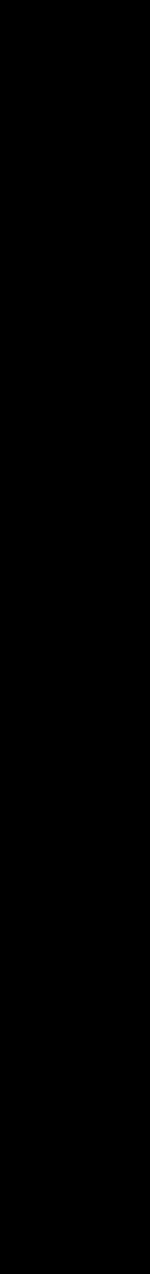

Konyves et al. 2010

Kaho Morii

Initial mass function (IMF) suggests that the ratio of high-mass stars is ~1%.

They are rare, and locate far from the sun. ⇒ Observations are difficult!

So far, only one or two candidates for high-mass prestellar core are reported (e.g., Nony et al. 2018).

Infrared-dark Cloud (IRDC)

Dark at optical and IR wavelength, but bright at radio

Kaho Morii

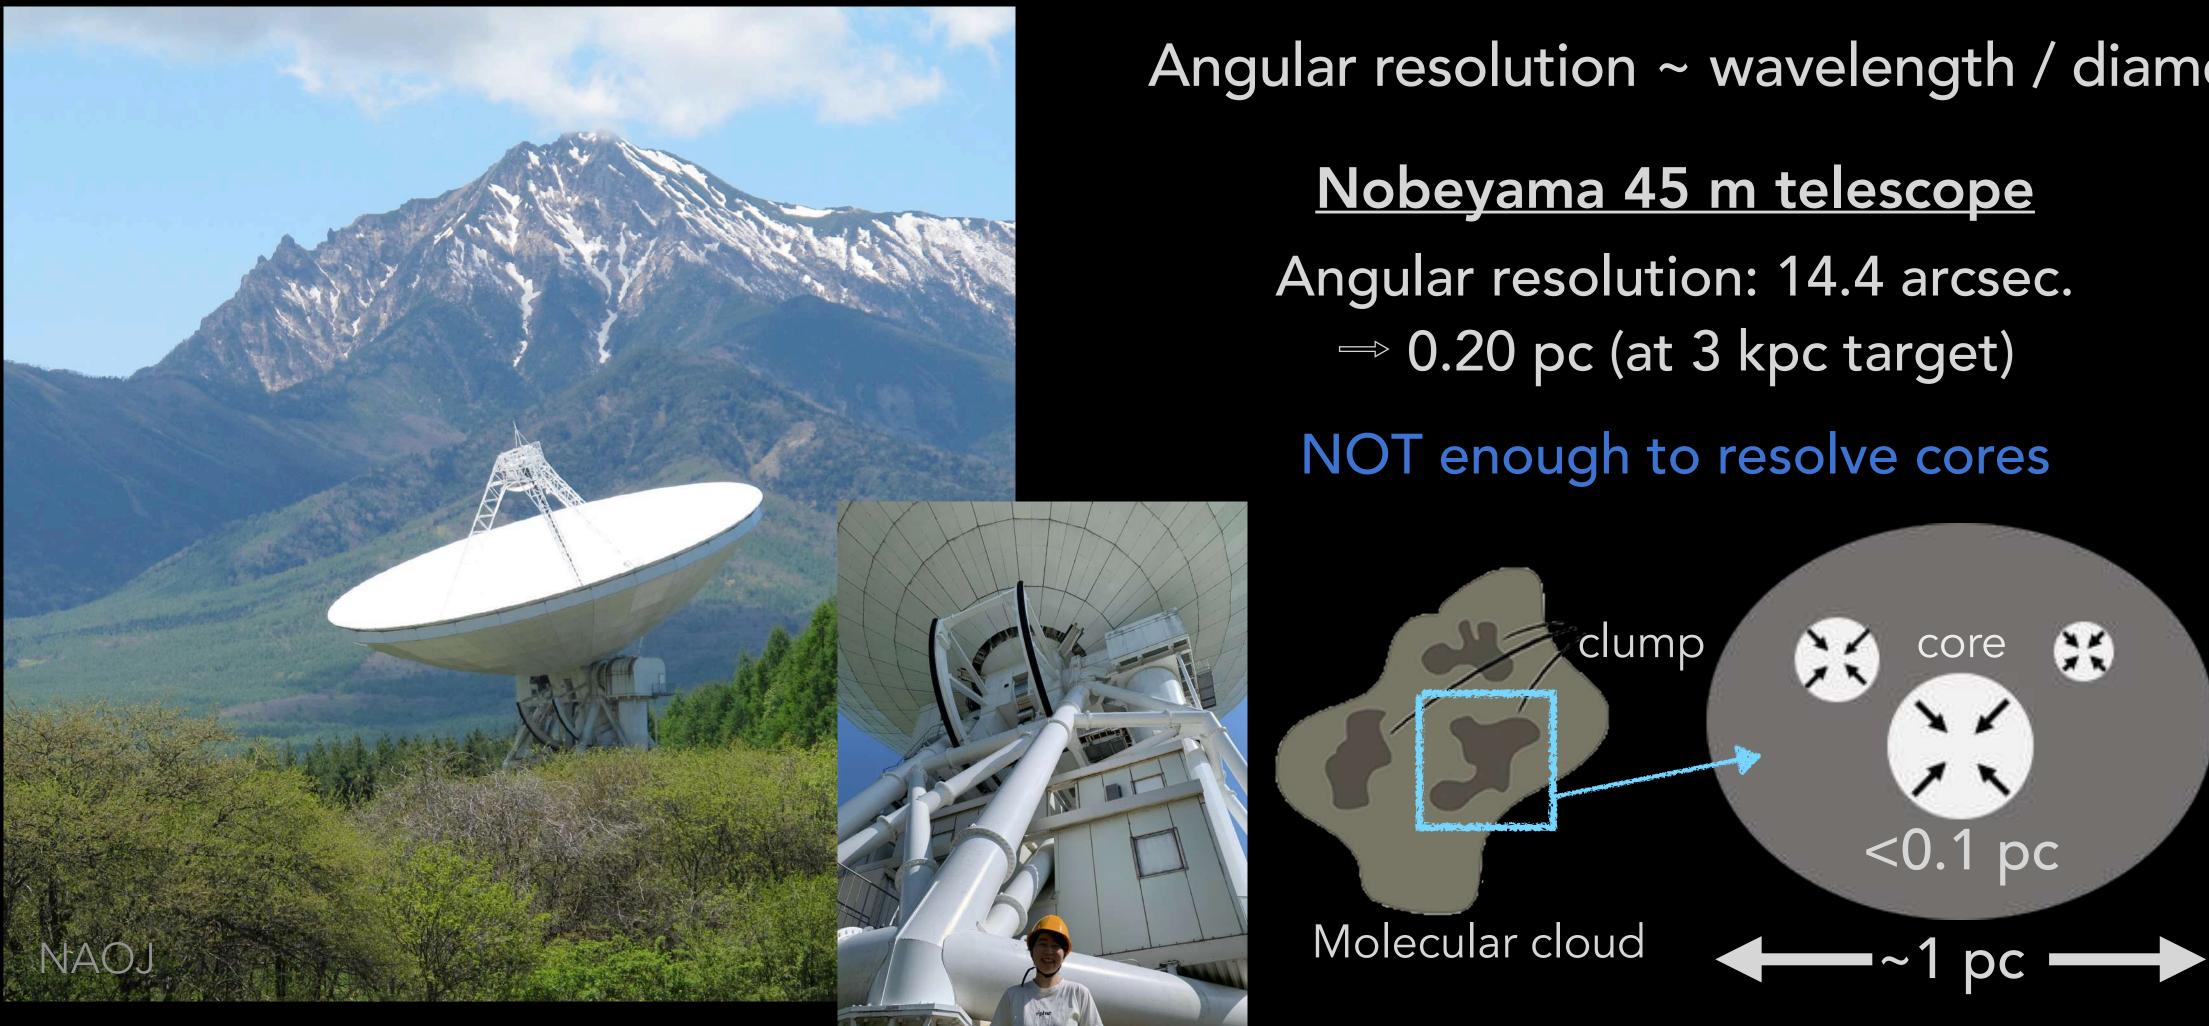

Massive (>10³ Msun), dense (>0.1 g cm $^{-2}$), and cold (T<10 K) region

> d > 3 kpc(~10,000 light year)

NASA/JPL-Caltech S. Carey (SSC/Caltech)

Student Fest by SGU-PG

Difficulties in observing IRDCs

Kaho Morii

Angular resolution ~ wavelength / diameter

Atacama Large Millimeter/submillimeter Array

And the second second

THE STORES

Maximum spatial resolution: ~0.04 arcsec. \Rightarrow 7×10⁻⁴ pc (at 3 kpc target)

Radio observations reveal cold stellar seeds

24 µm image

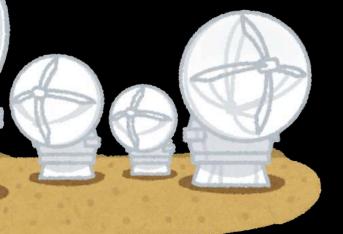

3.5, 8.0, and 1200 µm image

ALMA

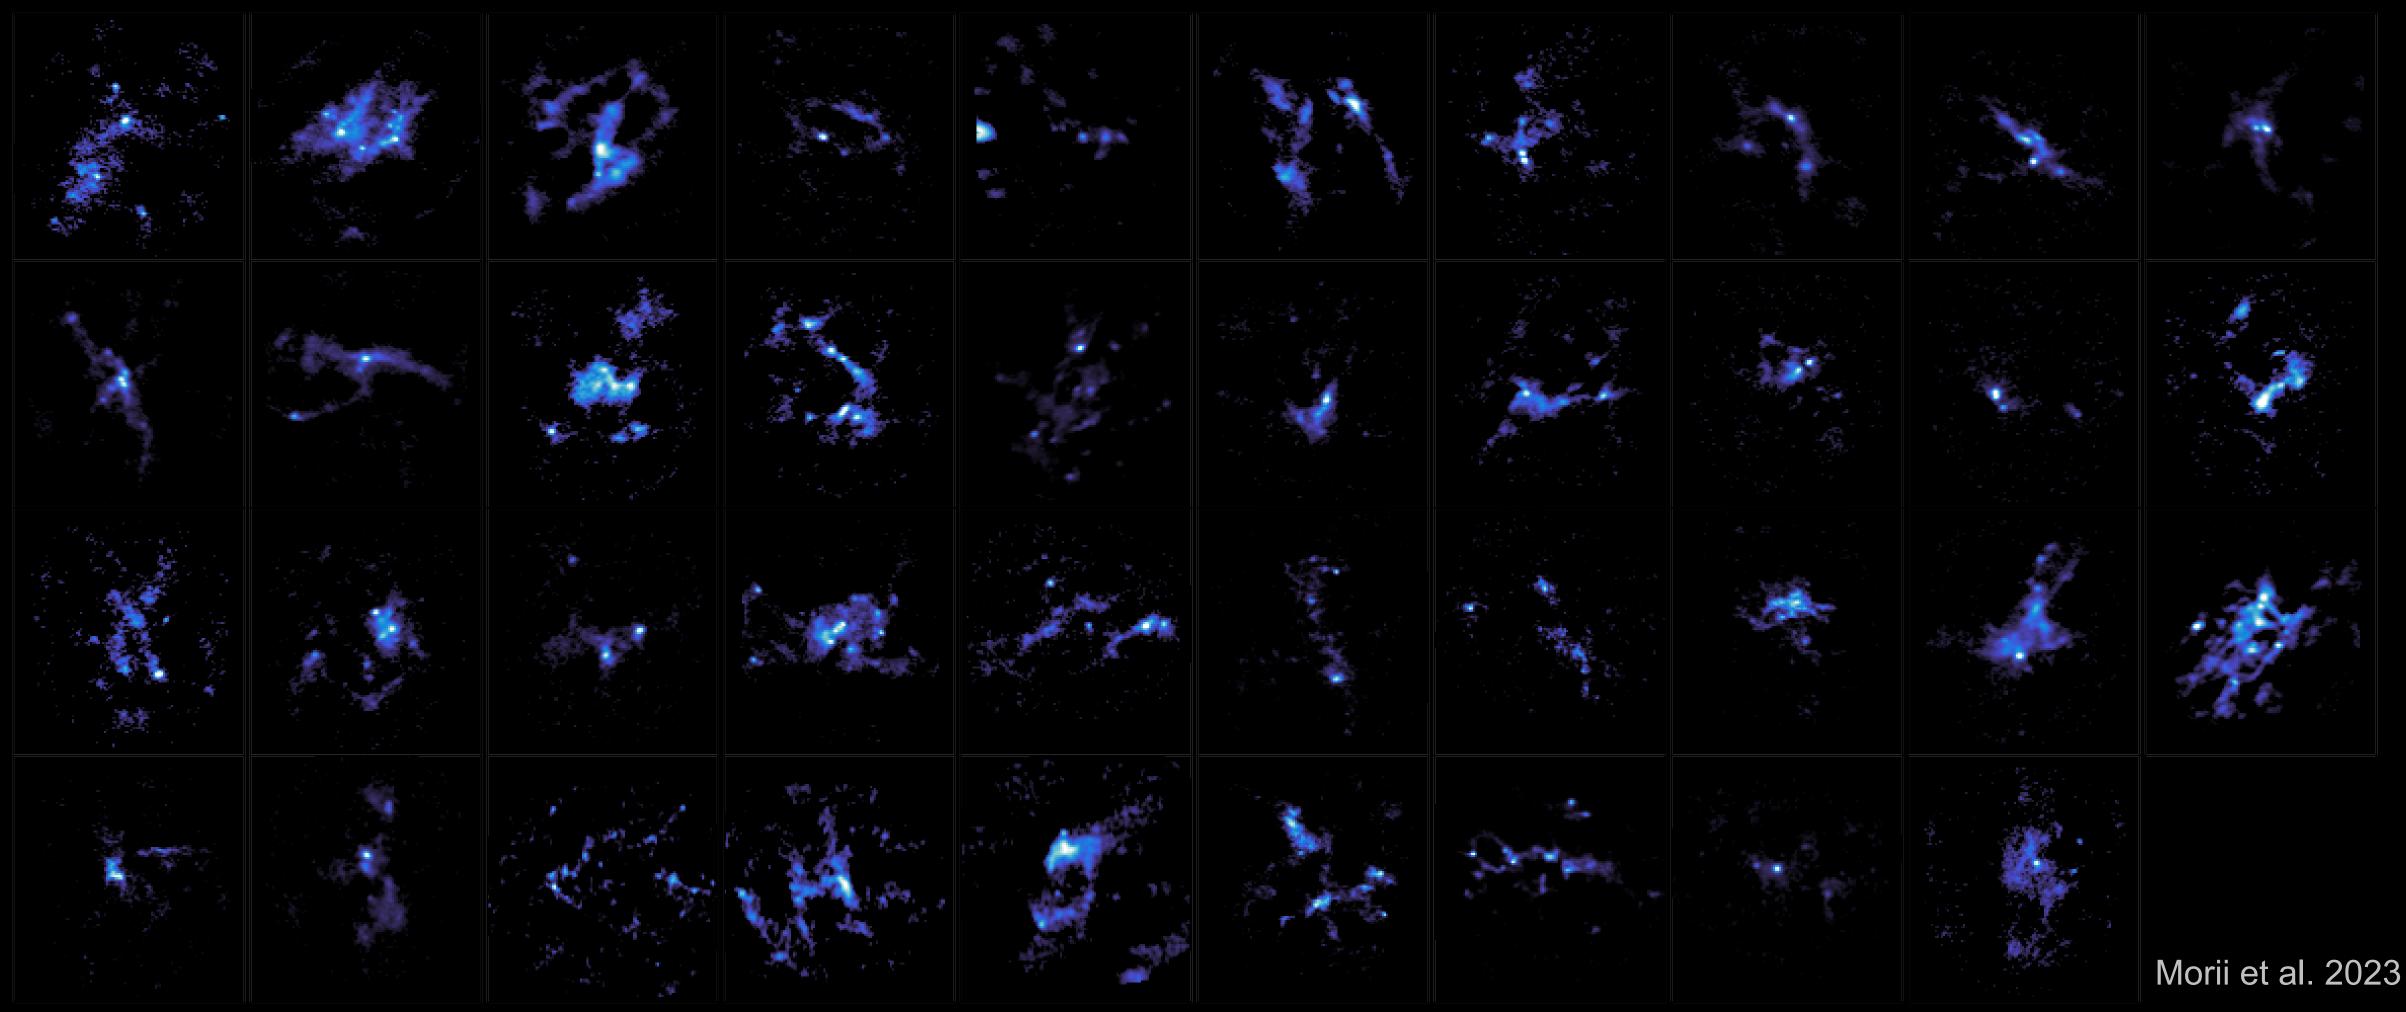

Deeply embedded star formation can only be revealed with ALMA (blue color)

Student Fest by SGU-PG

Morii et al. 2023 11

The ALMA Survey of 70 µm dark High-mass clumps in Early Stages (ASHE

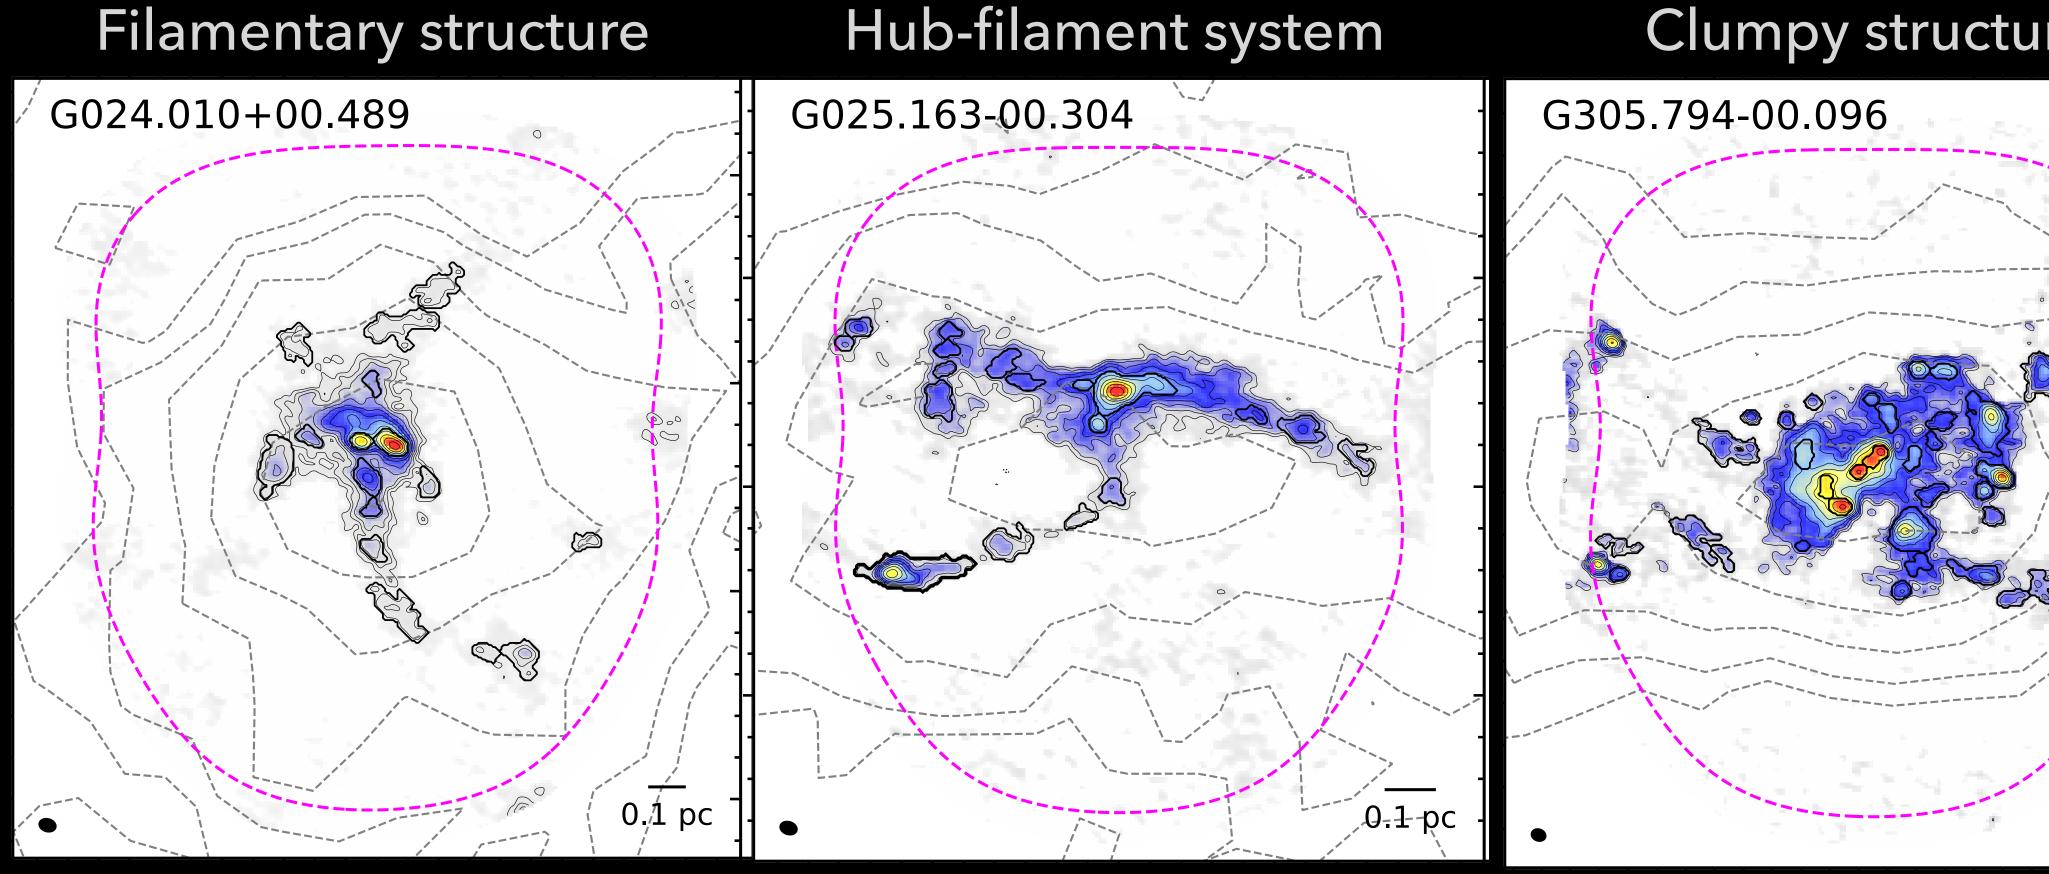

Kaho Morii

S)

Internal structure of 70 µm-dark massive clumps

dendrogram algorithm

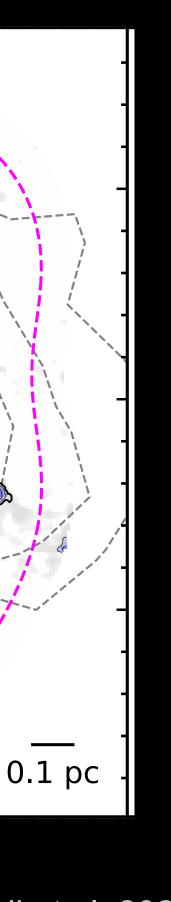

Kaho Morii

Student Fest by SGU-PG

Clumpy structure

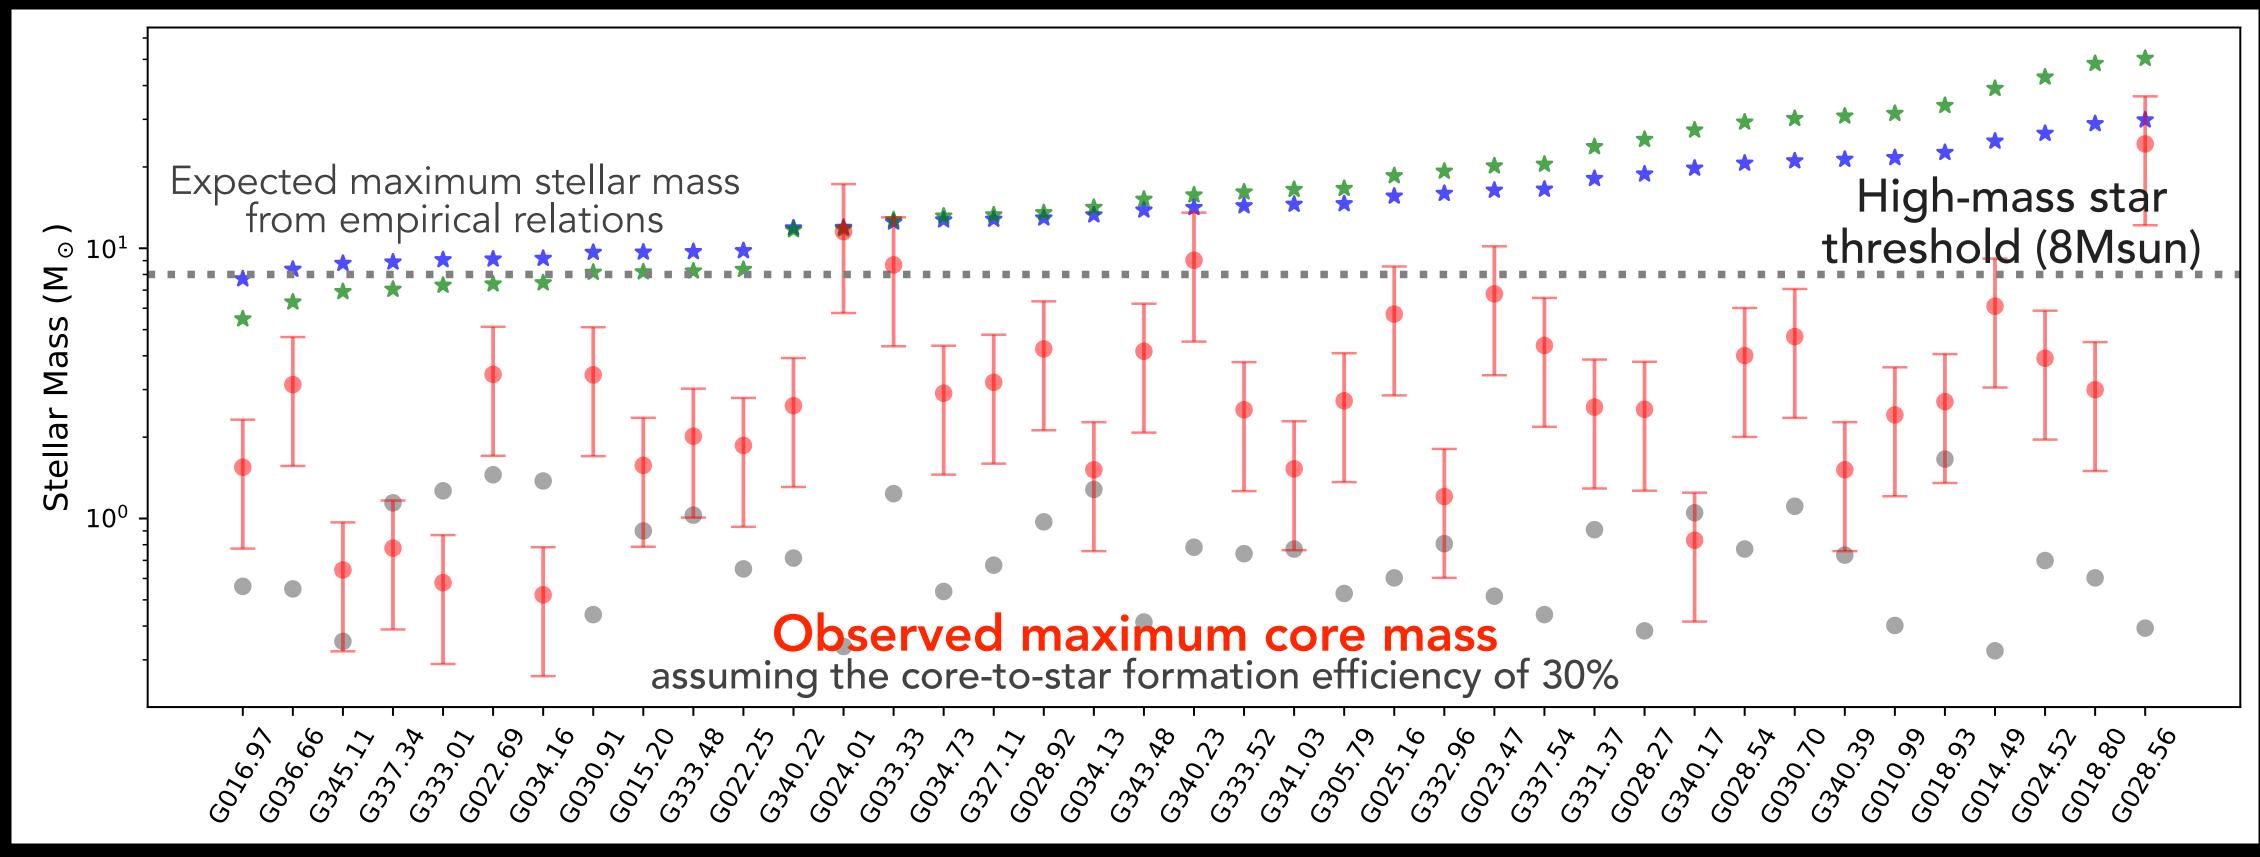

Morii et al. 2023

Core Mass

Kaho Morii

Student Fest by SGU-PG

 $F_{1.3 \,\mathrm{mm}} \to M_{\mathrm{dust}} \to M_{\mathrm{core}}$

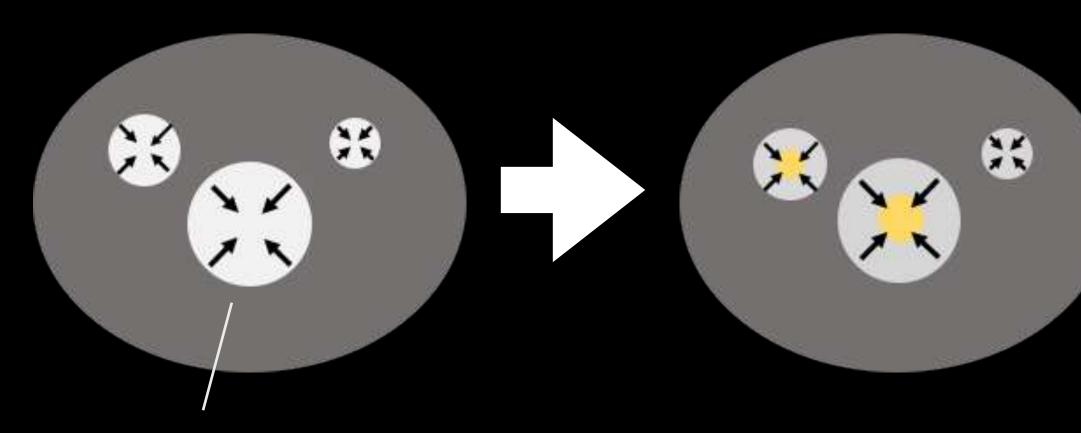

The most massive cores are low- to intermediate-mass cores, not enough massive to form HM stars.

High-mass star formation scenario

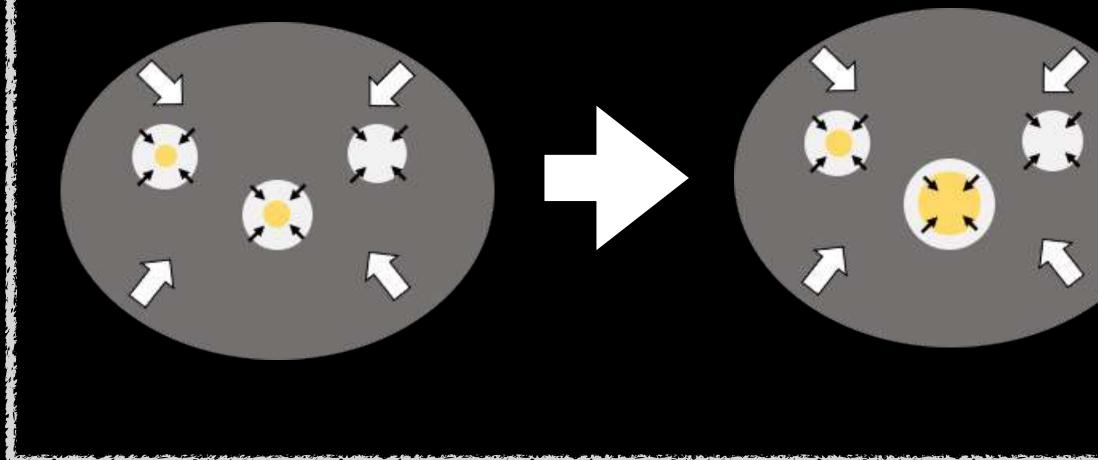

Core-fed accretion scenario High-mass prestellar core supported by strong turbulence or magnetic field

A high-mass prestellar core

Kaho Morii

Clump-fed accretion scenario Initially low- to intermediate-mass cores that grow in mass through gas feeding to form high-mass protostar

High-mass star formation picture

IR-dark phase
