Nuclear interaction models

In Geant4

- Nuclear interaction models are slow
- In particular the most sophisticated ones e.g. **QMD**

Trade-off between
computing **time** and
precision

Use simpler models

Problems in Geant4 below 100 MeV/u

No dedicated model to nuclear interaction **below 100 MeV/u** in Geant4

- **Exp. data**
- **G4-BIC**
- **G4-QMD**

[Plot from De Napoli et al.
Phys. Med. Biol., vol. 57, no.
22, pp. 7651–7671, Nov. 2012]

Many papers showed discrepancies:

Braunn et al. : one order of magnitude in ^{12}C fragmentation at 95 MeV/u on thick PMMA target

De Napoli et al. : angular distribution of the secondaries emitted in the interaction of 62 MeV/u ^{12}C on thin carbon target

Dudouet et al. : similar results with a 95 MeV/u ^{12}C beam on H, C, O, Al and Ti targets

Cross section of the ^6Li production at 2.2 degree in a ^{12}C on ^{nat}C reaction at 62 MeV/u.

BLOB (Boltzmann-Lagevein One Body)

- Test-particle approach
- Self-consistent **mean field** + collisions
- Probability to find a nucleon in the phase space

BLOB (Boltzmann-Lagevein One Body)

- Test-particle approach
- Self-consistent **mean field** + collisions
- Probability to find a nucleon in the phase space

BLOB (Boltzmann-Lagevein One Body)

- Test-particle approach
- Self-consistent **mean field** + collisions
- Probability to find a nucleon in the phase space

BLOB (Boltzmann-Lagevein One Body)

- Test-particle approach
- Self-consistent **mean field** + collisions
- Probability to find a nucleon in the phase space

BLOB (Boltzmann-Langevin One Body)

We interfaced BLOB with Geant4
and its de-excitation model

[C. Mancini-Terracciano et al. Preliminary results coupling
“Stochastic Mean Field” and “Boltzmann-Langevin One Body”
models with Geant4. In: Physica Medica 67 (2019), pp. 116–
122. doi: 10.1016/j.ejmp.2019.10.026.]

Accurate

Slow

Order of minutes per interaction!

$^{12}\text{C} + ^{\text{nat}}\text{C} \rightarrow ^4\text{He}$ at 62 MeV/u

Blob code optimization

- We optimised BLOB without changing the code structure (52% speed-up overall)

Not enough for practical applications

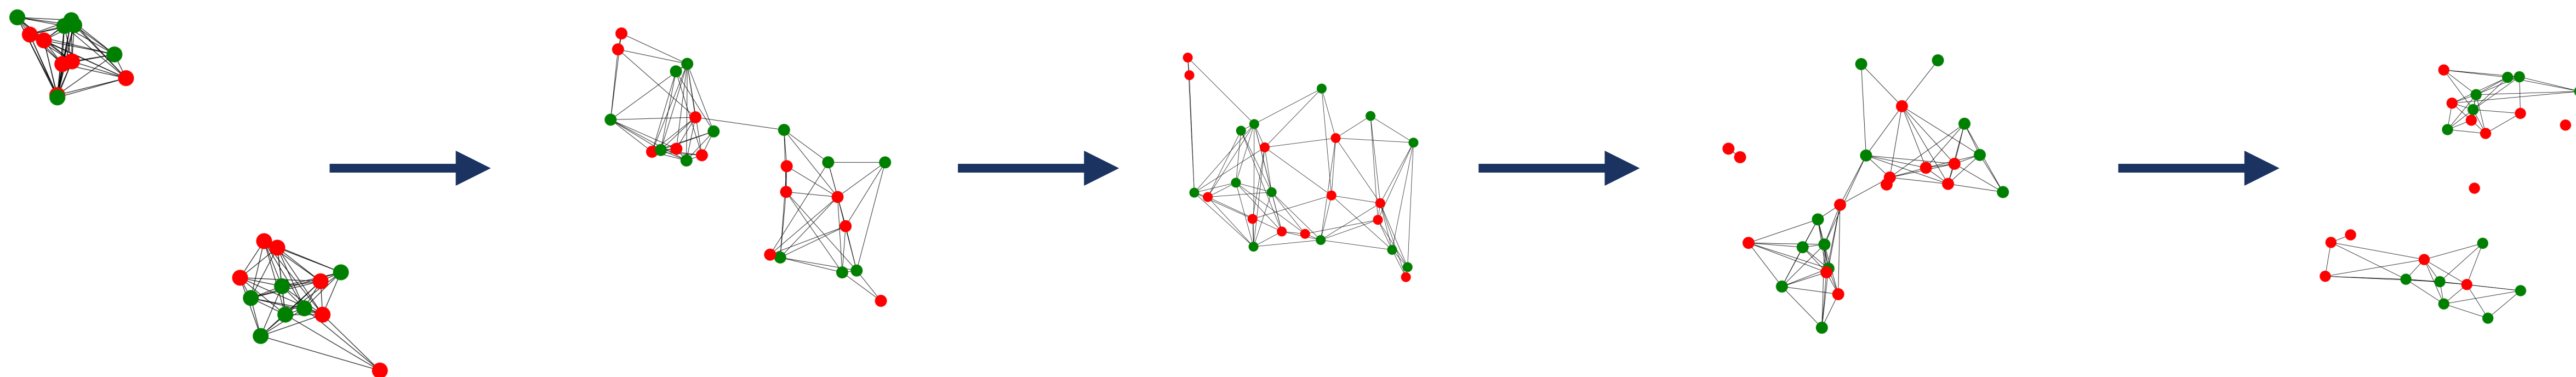

Deep Learning to accelerate NIMs

Starting from a proof-of-concept study on **G4-QMD**

Graph Networks Simulator approach

Train a **Graph Neural Network** to emulate the **interaction dynamics**

Each nucleon is a node of the graph

Convolve the central node's representation with its neighbours' representations

[A. Sanchez-Gonzalez et al. "Learning to simulate complex physics with graph networks." PMLR, 2020.]

Drawbacks

- Quantities are conserved on average
- Comparable performance to Euler method
- Results with fully connected graph
- $N_{edges} \propto N^2$

Going Hybrid

Why?

- Approximating complex functions with **Neural Networks**
- Leveraging **GPU acceleration** for ultra-fast execution

How?

- Building **Physics-inspired** architectures

Physics under control

Explainability

What to emulate?

The Potential

It is the Bottleneck

Profiling BLOB
with Intel VTune Amplifier

~ 4 mins per
interaction

3 mins: computing mean field laplacian

Elapsed Time[?]: 110.235s

CPU Time[?]: 110.223s

Total Thread Count: 1

Paused Time[?]: 0s

Top Hotspots

This section lists the most active functions in your application. Optimizing these hotspot functions typically results in improving overall application performance.

Function	Module	CPU Time [?]
lapla	run	56.086s
erff	libm.so.6	17.038s
define_two_clouds_rp	run	9.051s
sortrx	run	7.450s
powf	libm.so.6	5.184s
[Others]		15.414s

Learning the Potential: DL model

Particle-wise MLP for Potential Prediction

In QMD

$$V_i = \sum A_{ij} + \left(\sum B_{ij} \right)^\gamma$$

$$f(q_i, q_j, p_i, p_j, c_i, c_j) =$$

MLP

Learning the Potential: DL model

Particle-wise MLP for Potential Prediction

Learning the Potential: DL model

Particle-wise MLP for Potential Prediction

Building a DL model which:

- is **coherent** with the Physics

Two body interactions embedded in the architecture

- works with **any** number of particles

Particles are treated in **batch**

Potential Predictions

Model:

5 layers MLP + ReLu + LayerNorm

Data:

23k stories

10 events

24 particles : ~5 M examples

Training: ~3d training on Nvidia V100

Results: Median Relative Error 0,05 %

C12 on C12 at 62 MeV/u

Implementation in Geant4

Exporting the DL models from pytorch to **ONNX**

Using ONNX C++ API  substituting GetPotential() Method in QMD

```
G4double MyQMDMeanField::GetPotential_dl( G4int i )
{
    // -----PREDICT WITH DEEP LEARNING -----
    return static_cast<G4double>( ONNXInterface::GetInstance()->Generate(i, system)[0] );
    // -----
}
```

Thread-safe implementation

Test on the Potential

Simulating the reaction:

C12 on C_nat at 62 MeV/u

Interfacing DL model with Geant4

- Reasonable accuracy on double differential cross section of **lighter fragments**

Test on the Potential

However: for heavier fragments

- Even **small errors** on the potential **propagate** badly to the double differential cross sections
- It is not the bottleneck!

Only 4% of QMD execution time

Another possibility

Derivatives of the Hamiltonian

Emulating $\frac{\partial H}{\partial q}, \frac{\partial H}{\partial p}$

- 1) Cross sections are **resilient** to 1-2% errors

Callees	CPU Time: Total ▼ 
▼ MyQMReaction::ApplyYourself	100.0%
▼ G4QMDField::DoPropagation	88.7%
▶ G4QMDField::CalGraduate	47.5%
▶ G4QMDField::Cal2BodyQuantities	40.5%

- 2) This is the **bottleneck!**

CalGraduate() is
50% of QMD

Emulating the derivatives

Same architectural design of the Potential model

$$\frac{\partial H}{\partial q, p} \approx \sum A_{ij} + \sum_{\alpha^{(k)}} \left(\sum B_{ij}^{(k)} \right)^{\alpha^{(k)}}$$

Approximating the derivatives

Hyper-parameter optimization on the number of **terms K**

Derivatives prediction

Model: $2 \alpha^{(k)}$ terms +
5 layers MLP + ReLu + LayerNorm

Data:

12k stories

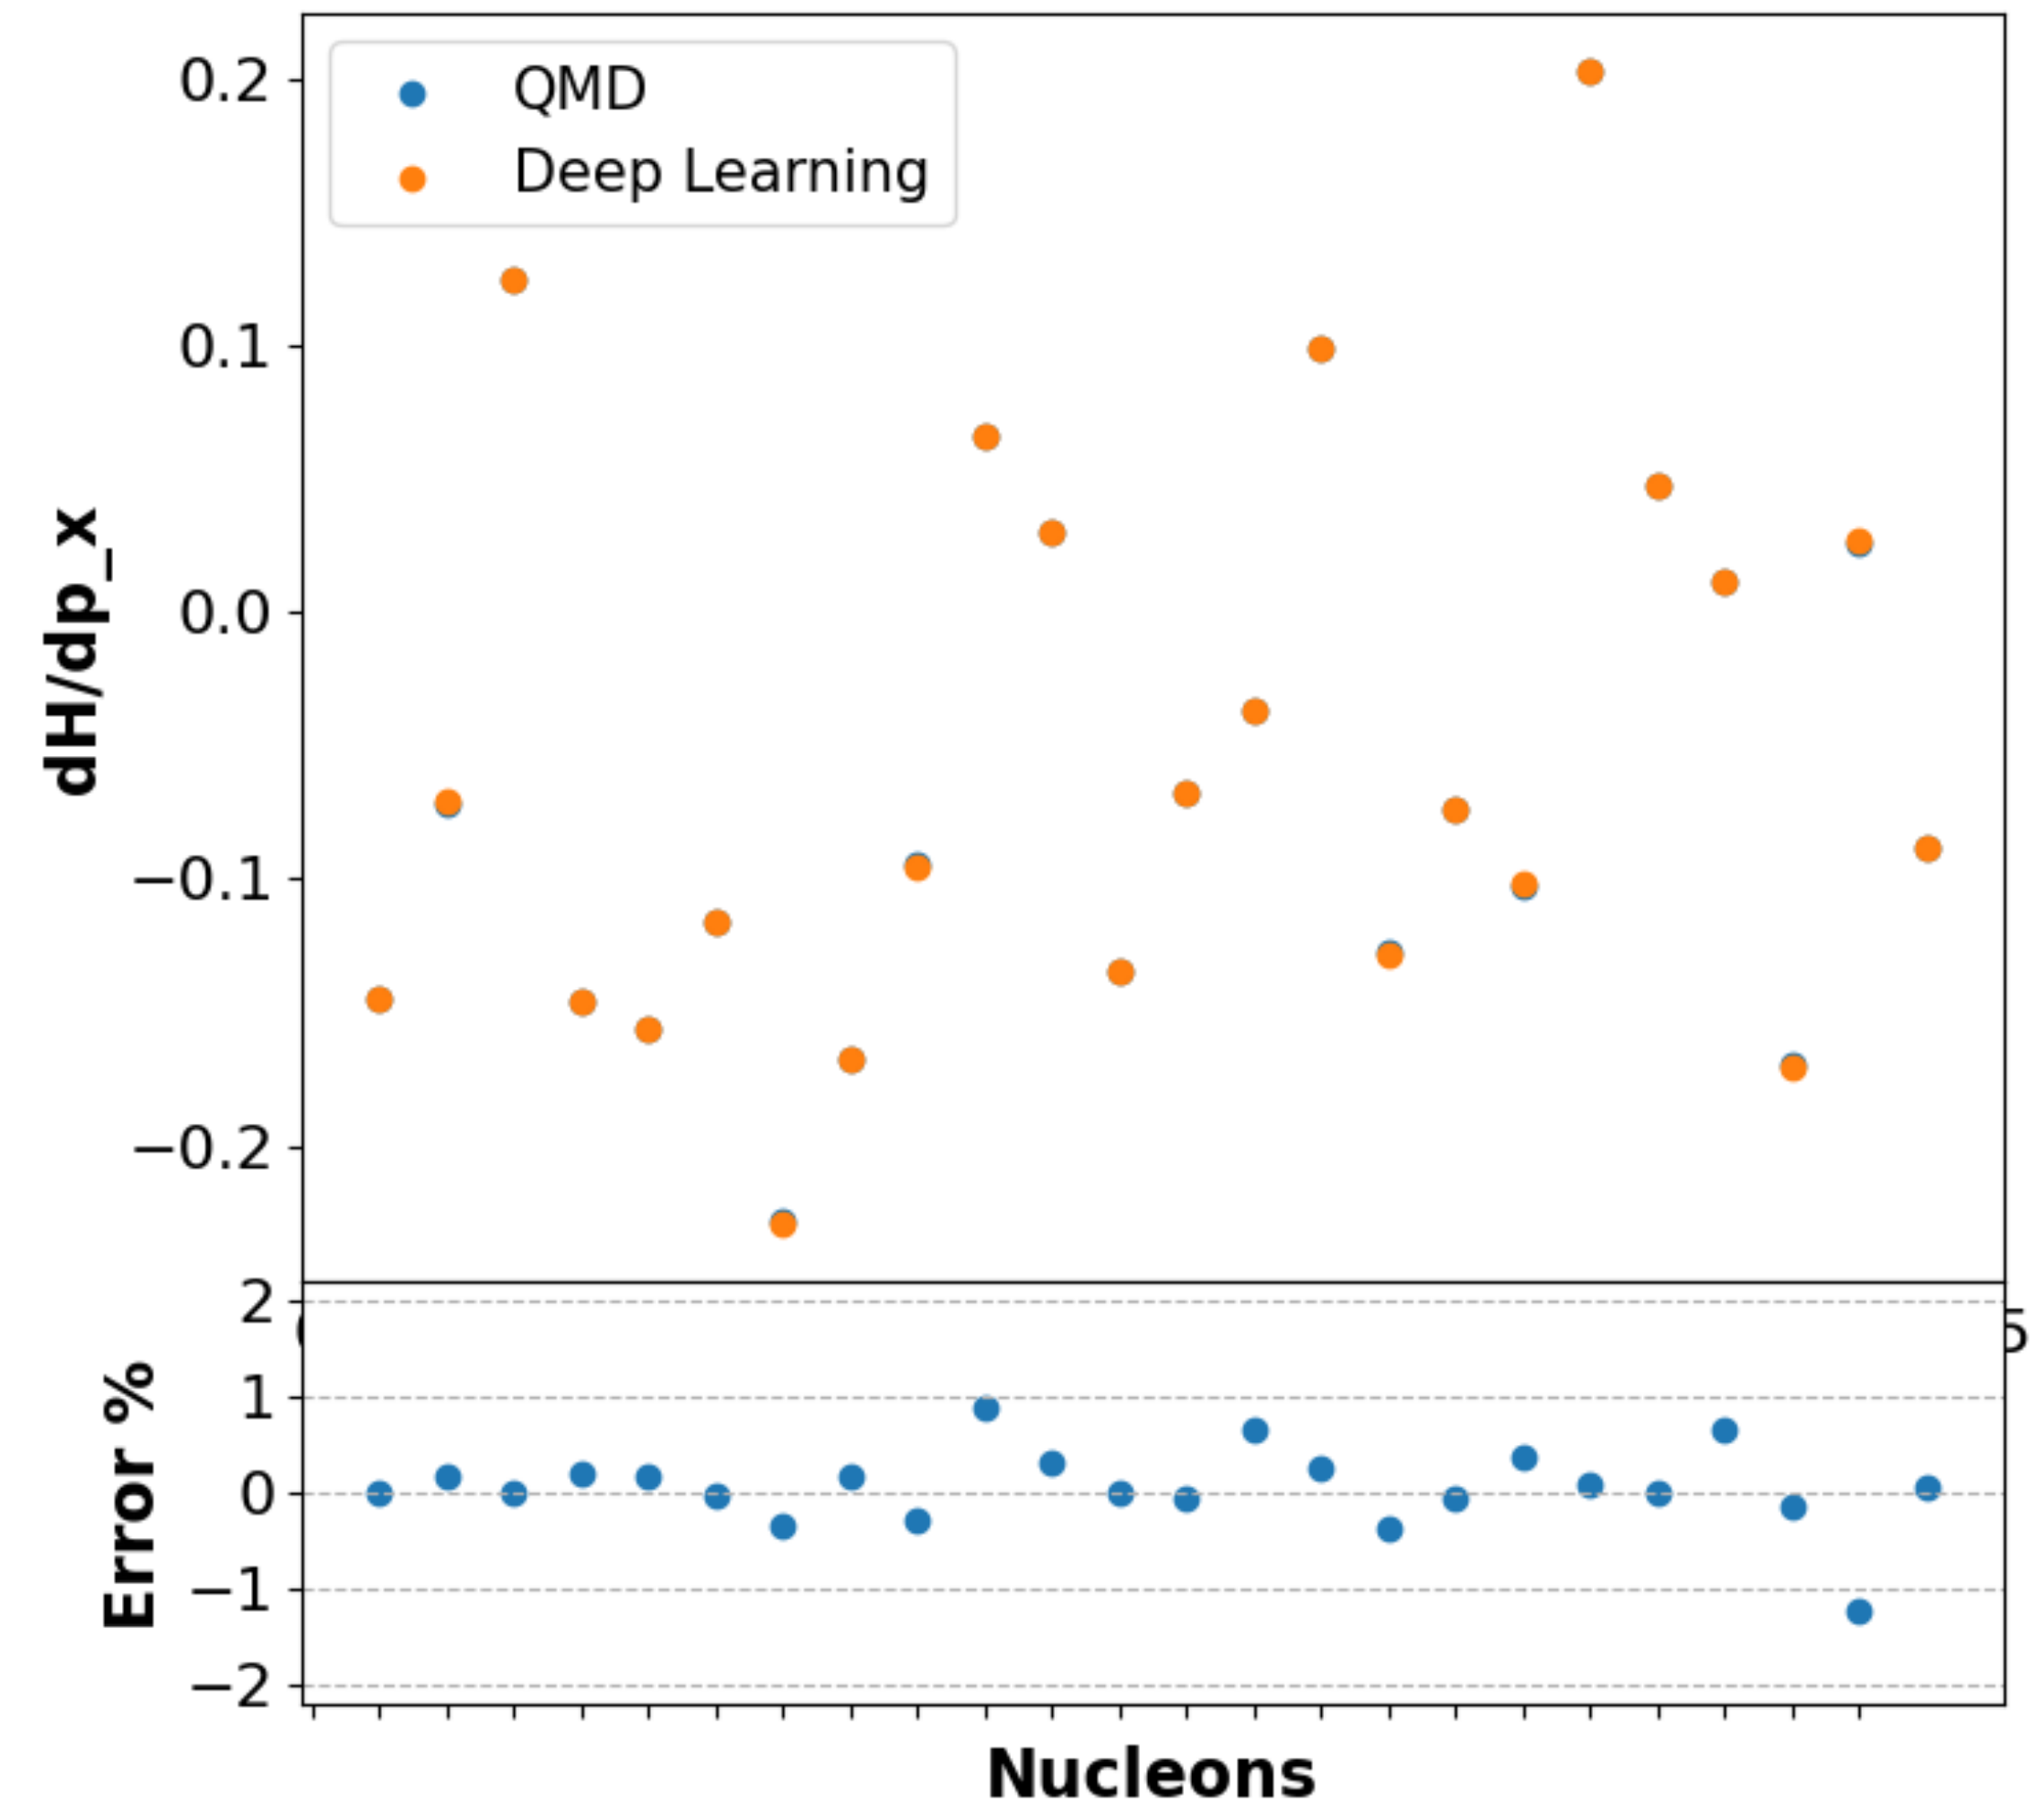

1 events

24 particles : ~300k examples

Training: ~3h training on Nvidia V100

Results: Median Relative Error 0,6 %

C12 on C12 at 62 MeV/u

Implementation in Geant4

Exporting the DL models from pytorch to **ONNX**

Using ONNX C++ API  substituting CalGraduate() Method in QMD

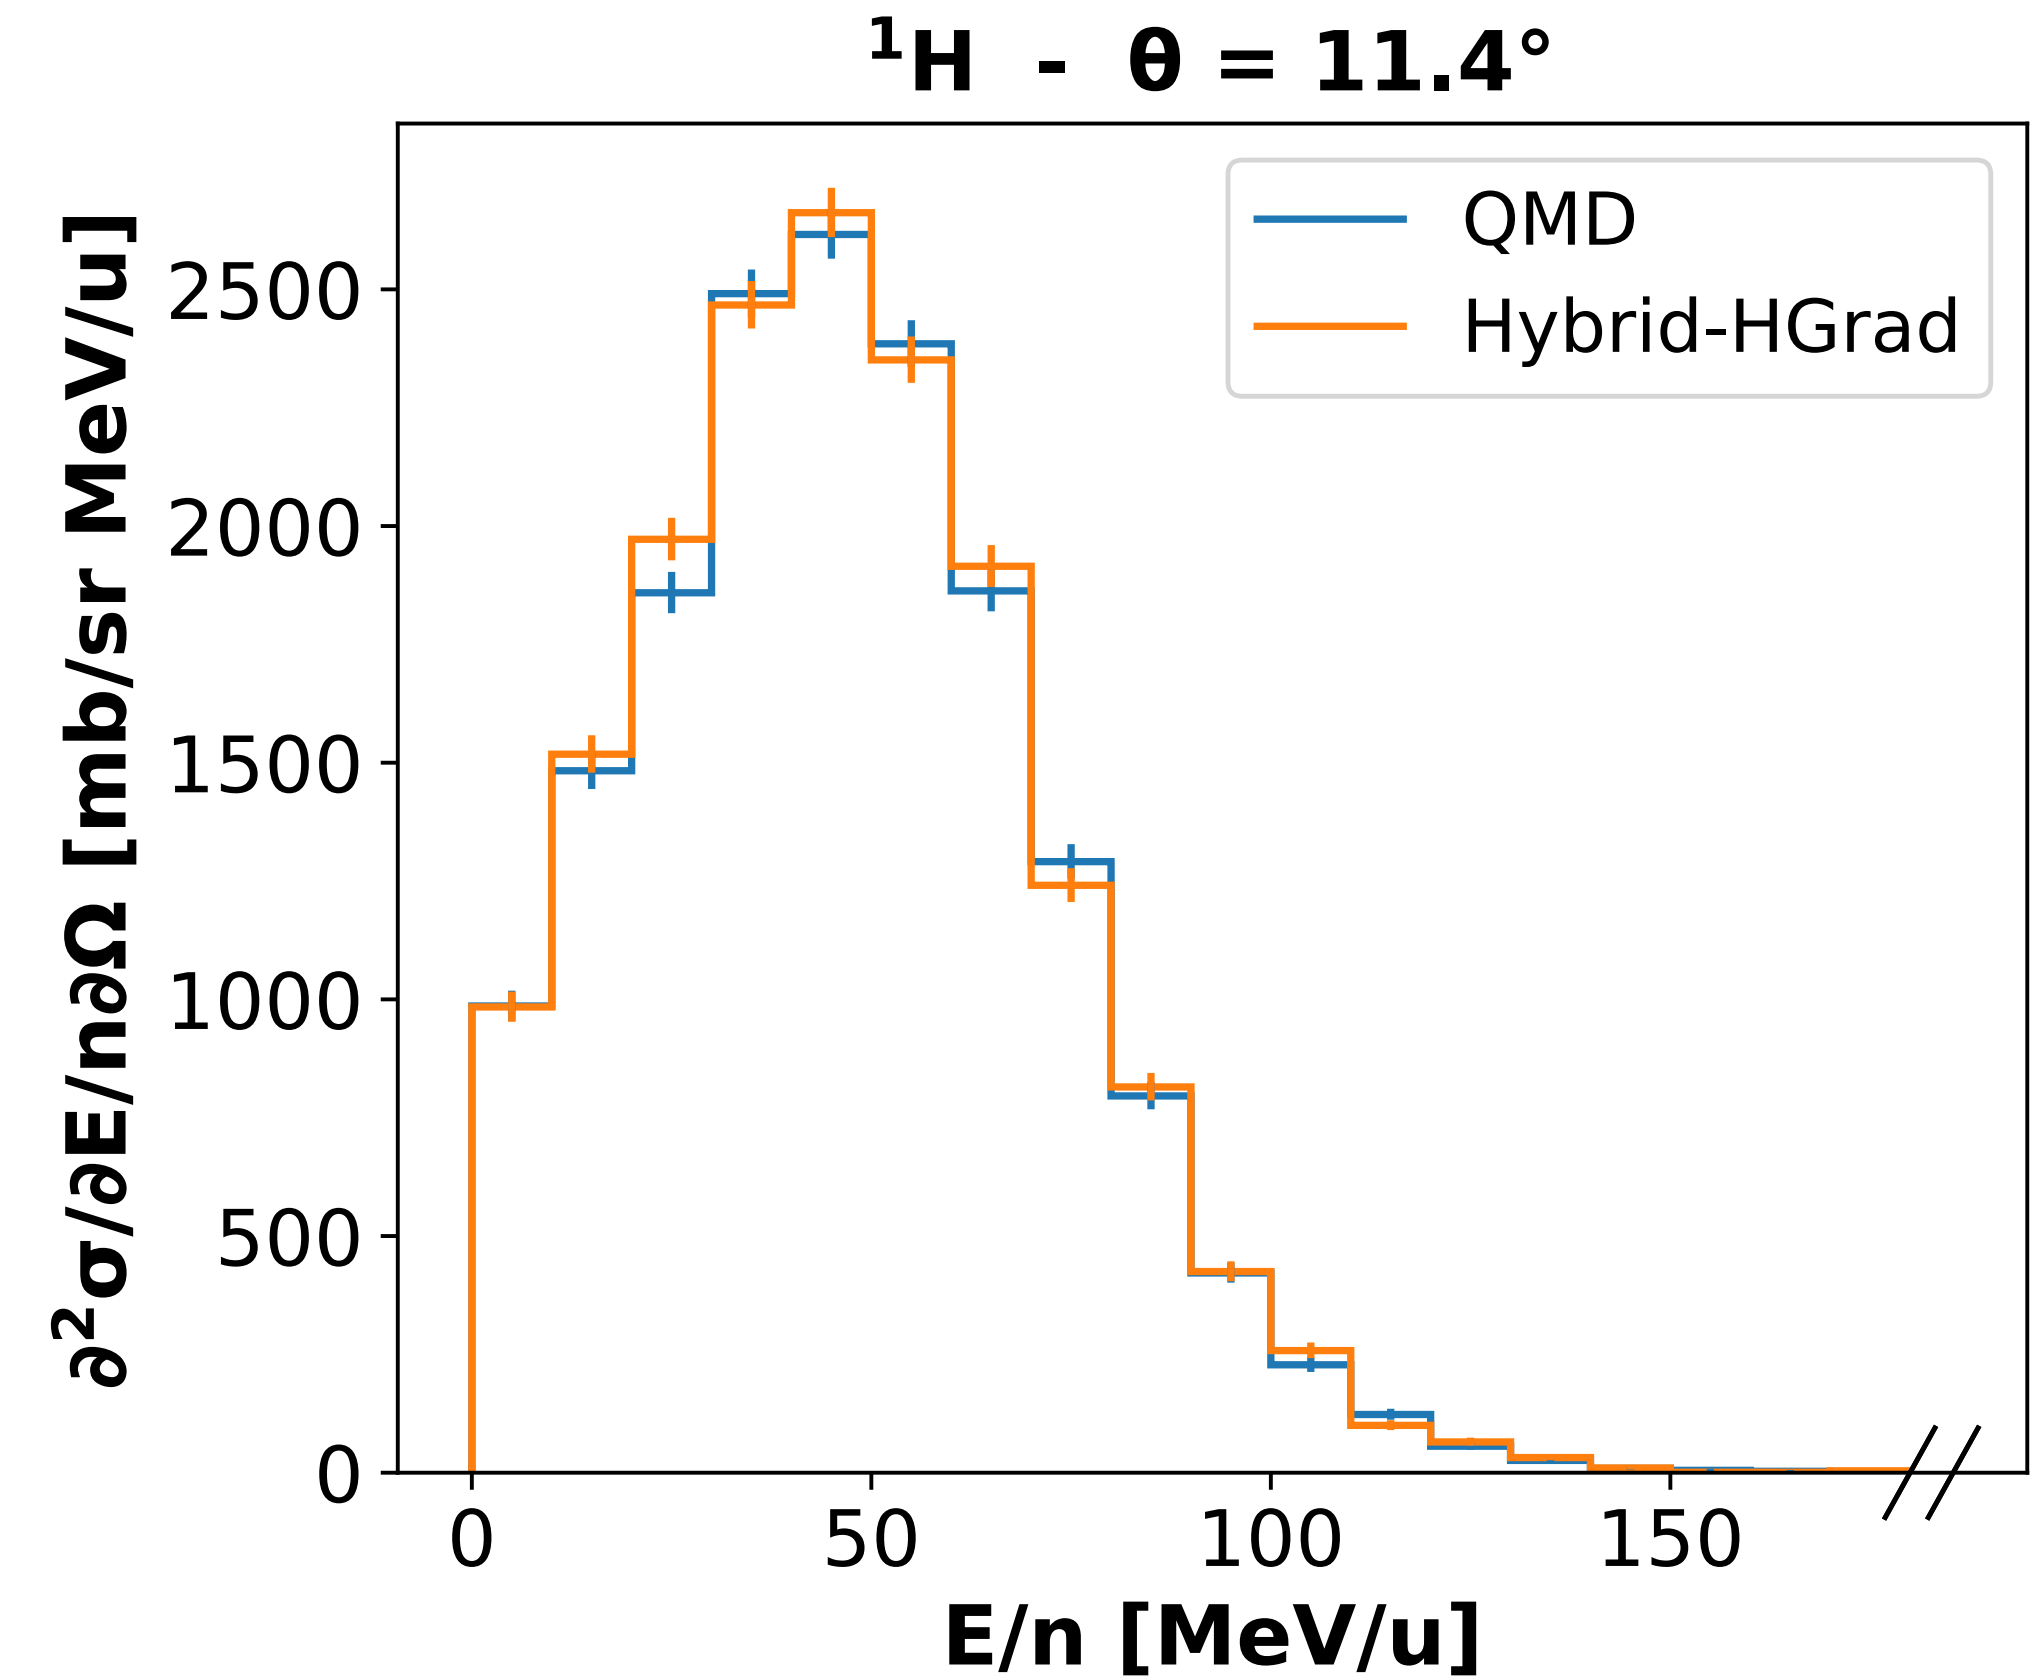

```
void MyQMDMeanField::CalGraduate_dl()  
{  
    ffr.resize( system->GetTotalNumberOfParticipant() );  
    ffp.resize( system->GetTotalNumberOfParticipant() );  
  
    // ----- PREDICT WITH DEEP LEARNING -----  
    auto gradients = ( ONNXInterface::GetInstance()->Generate(system) );  
    ffr = gradients[0];  
    ffp = gradients[1];  
}
```

Thread-safe
implementation

Double differential cross sections

Emulating H Grad

^{12}C on ^{nat}C at 62 MeV/u

Multi Ion Training

- Extension to multi ions and energies
- Extension to **Light Ion QMD**

Recent QMD optimization

$$\frac{\partial H}{\partial q, p} \approx \sum A_{ij} + \sum_{\alpha^{(k)}} \left(\sum B_{ij}^{(k)} \right)^{\alpha^{(k)}}$$

Double differential cross sections

Test set

^4He on $^{\text{nat}}\text{C}$ at 115 MeV/u

^4He - $\theta = 21.8^\circ$

^8Be on $^{\text{nat}}\text{C}$ at 75 MeV/u

^1H - $\theta = 17.2^\circ$

Paper in preparation

Double differential cross sections

Test set

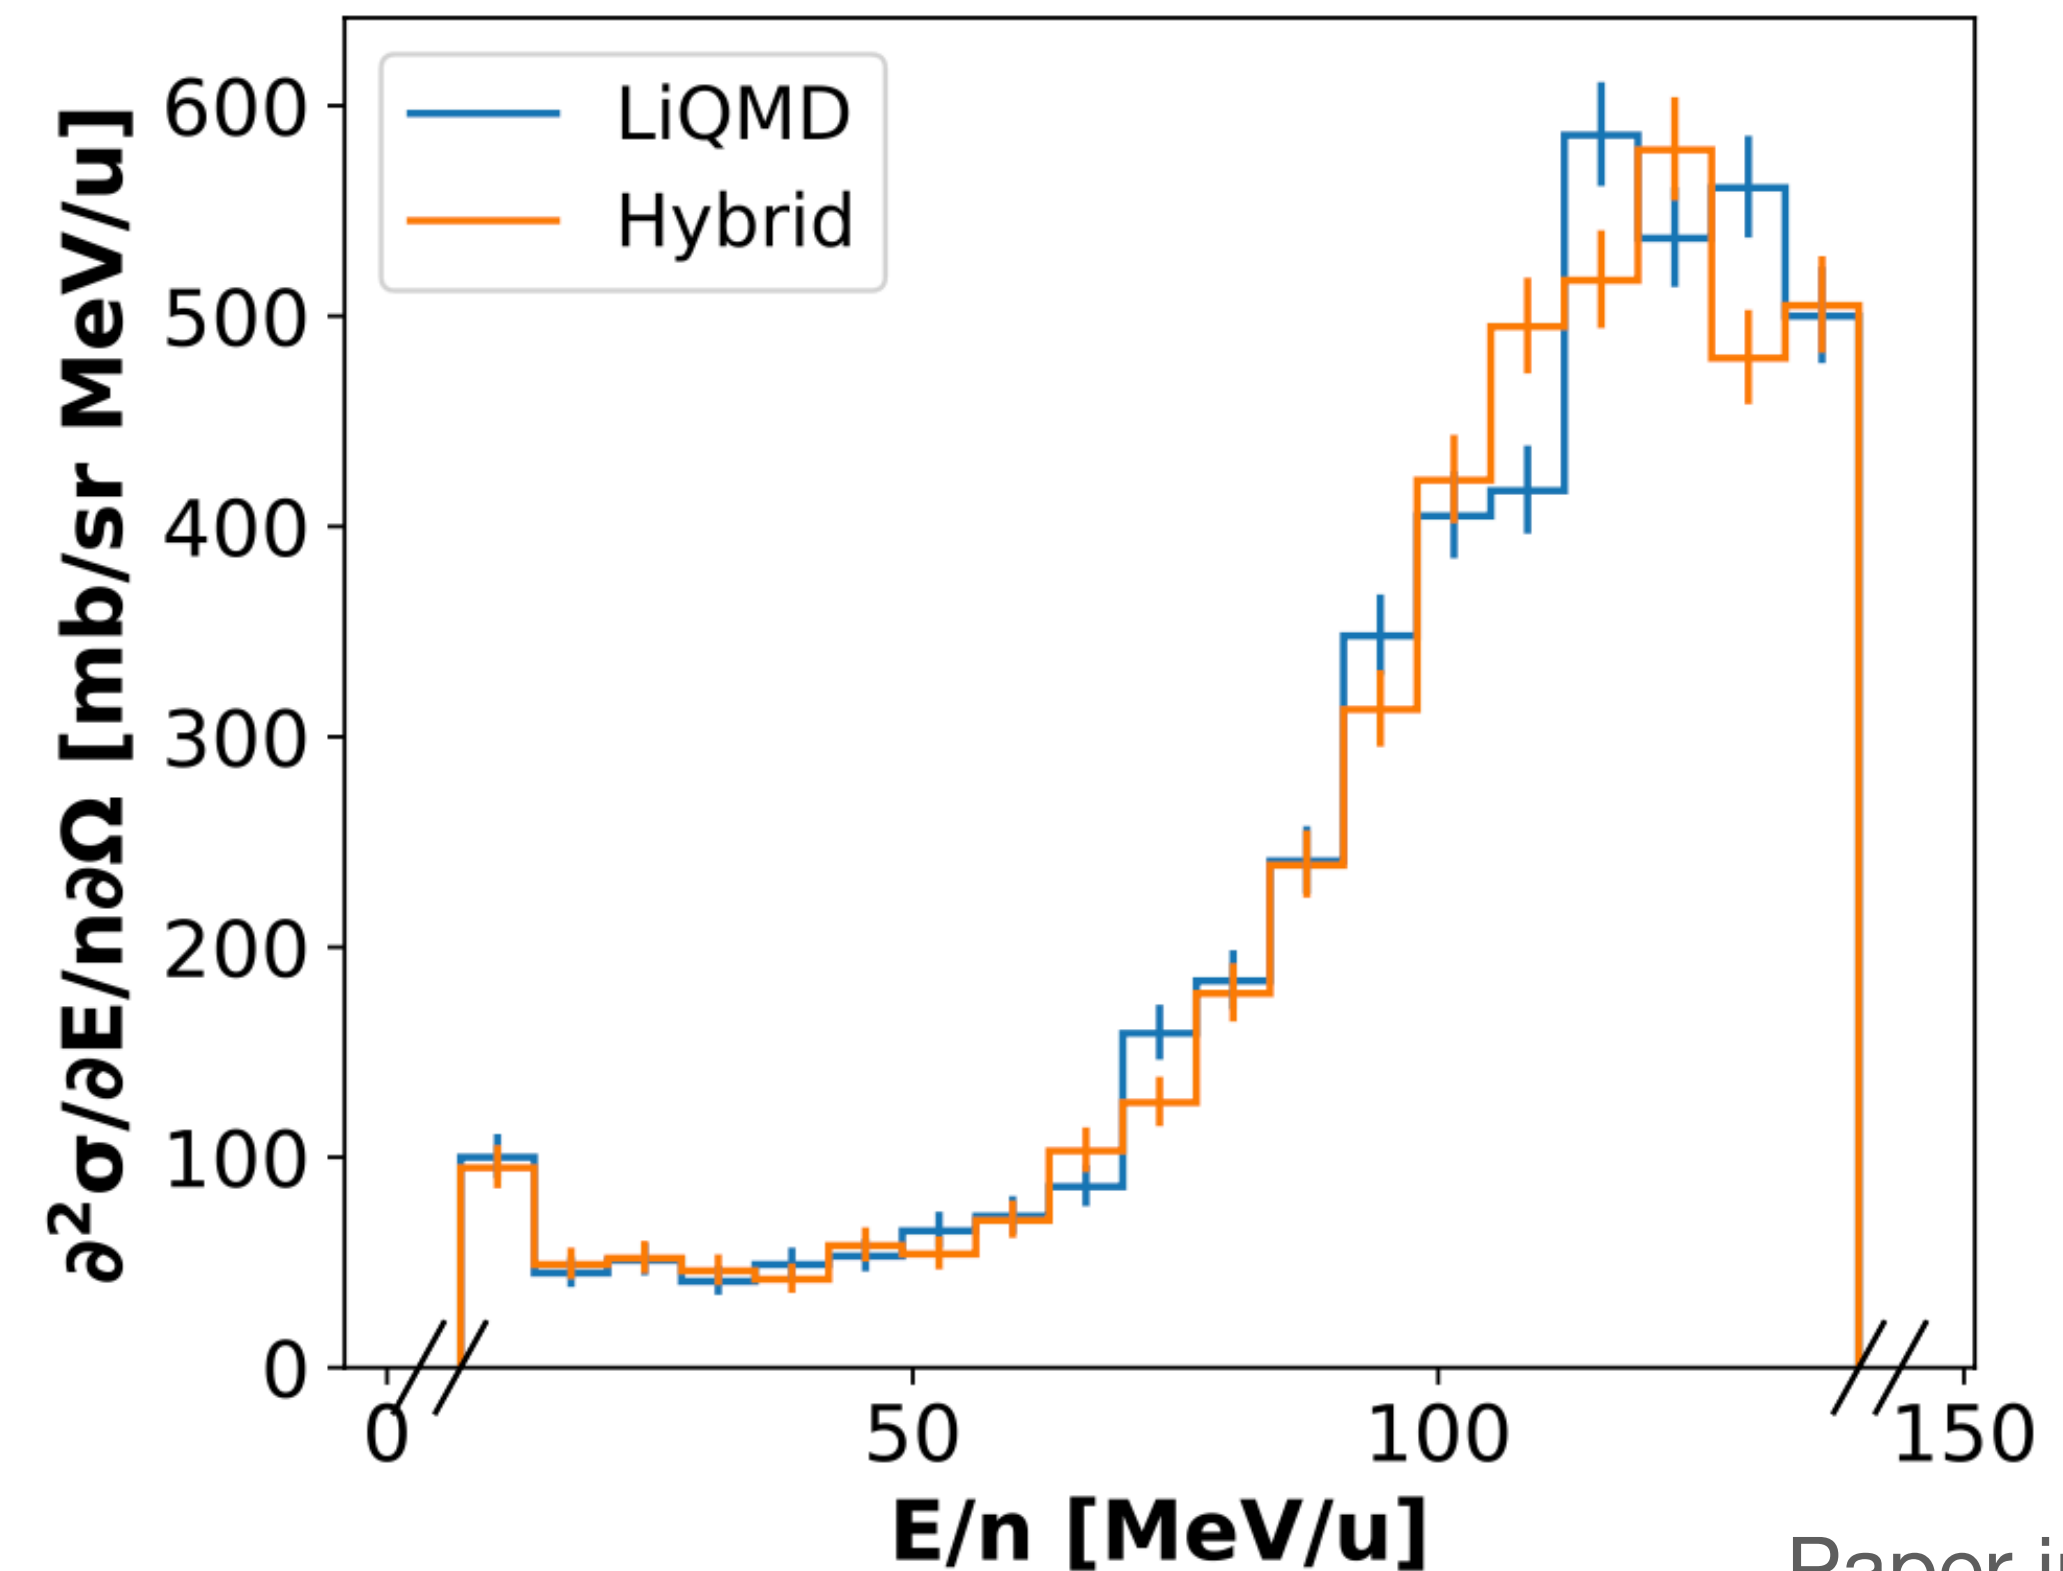

^{16}O on $^{\text{nat}}\text{C}$ at 105 MeV/u

^1H - $\theta = 11.4^\circ$

^{20}Ne on $^{\text{nat}}\text{C}$ at 85 MeV/u

^2H - $\theta = 11.4^\circ$

Paper in preparation

Next steps

Extension to BLOB

Next steps

Extension to BLOB

Full DL modeling

Inputting the potential removes the need for fully connected geometry

Emulating tracking and collisions with GNN

Next steps

Extension to BLOB

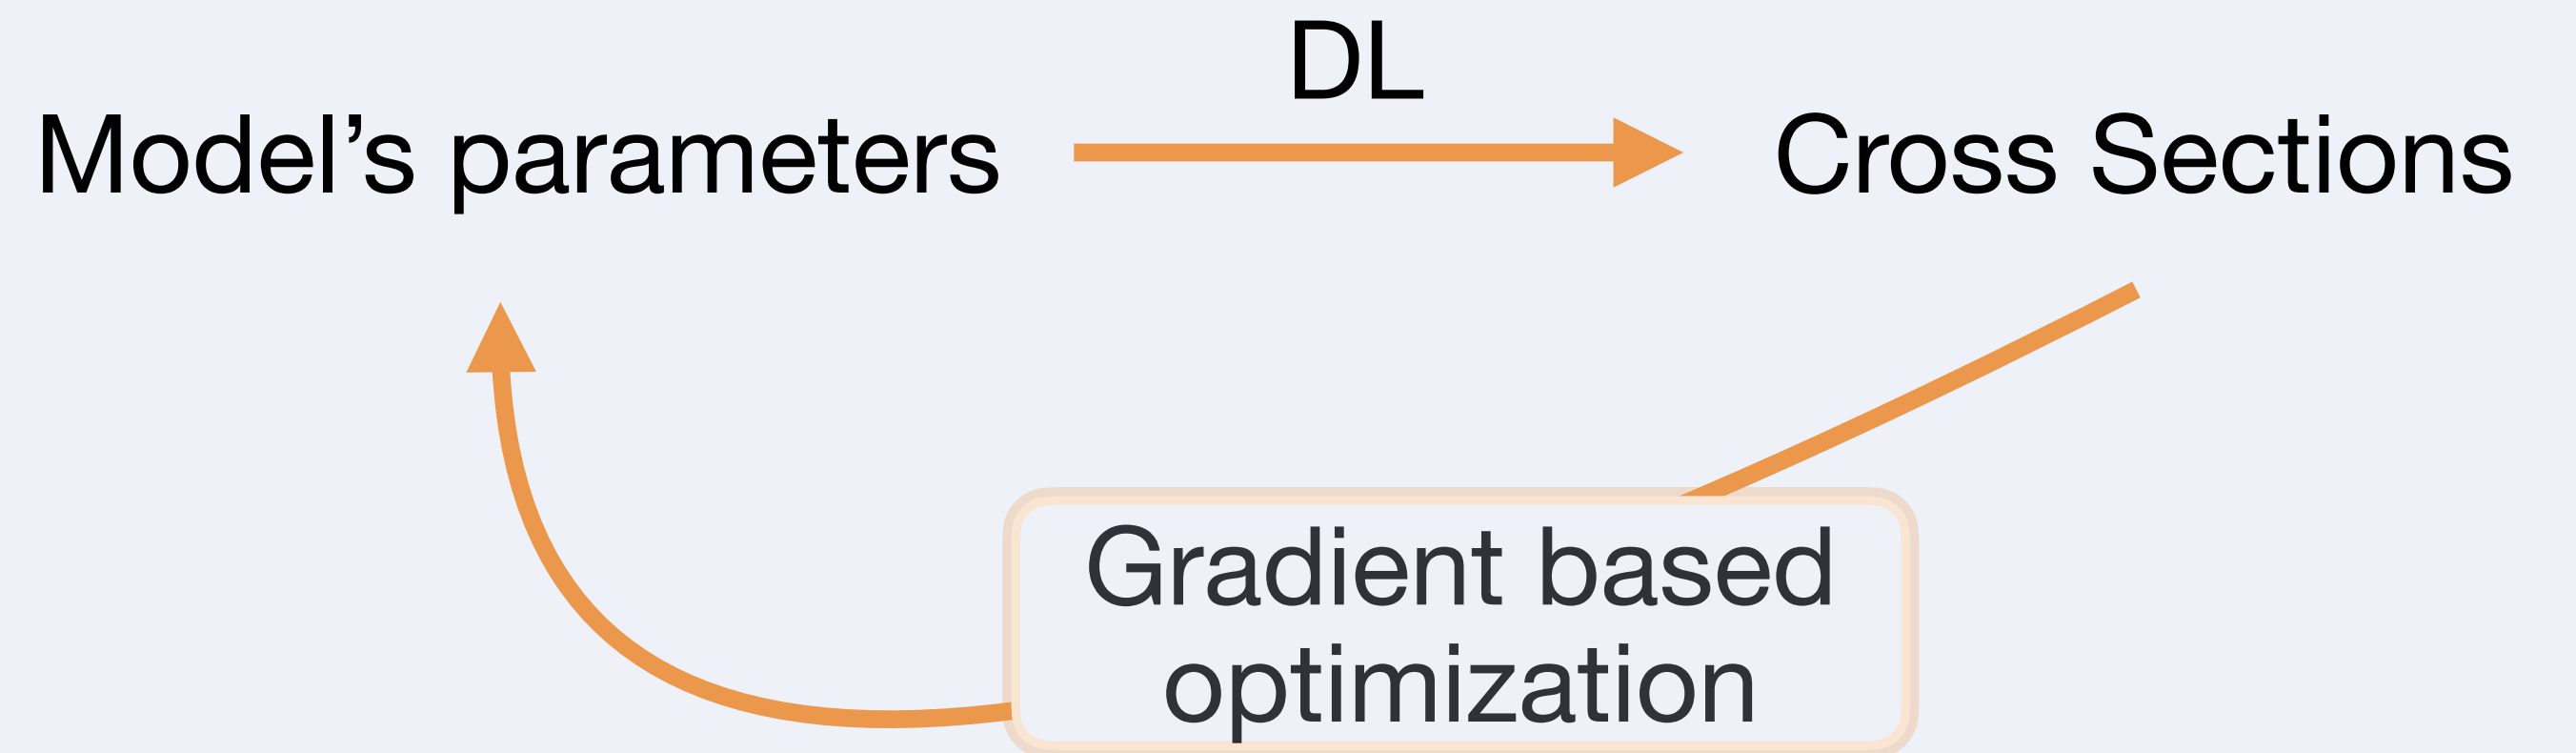

Full DL modeling

Inputting the potential removes the need for fully connected geometry

Emulating tracking and collisions with GNN

QMD and LiQMD Optimisation

Fully differentiable pipeline:

Emulating de-excitation model

Thank you for your attention!

- Nuclear interaction models in Geant4:
 - Sophisticated models are **slow**
 - No dedicated model under 100 MeV/u
- **Deep Learning** approach for model emulation
 - Emulation of **Hamiltonian derivatives** with DL for QMD
 - **Multi ion** training to achieve generalization
 - Possible model **optimization** or speed-up

Carbon Ion Radiation Therapy

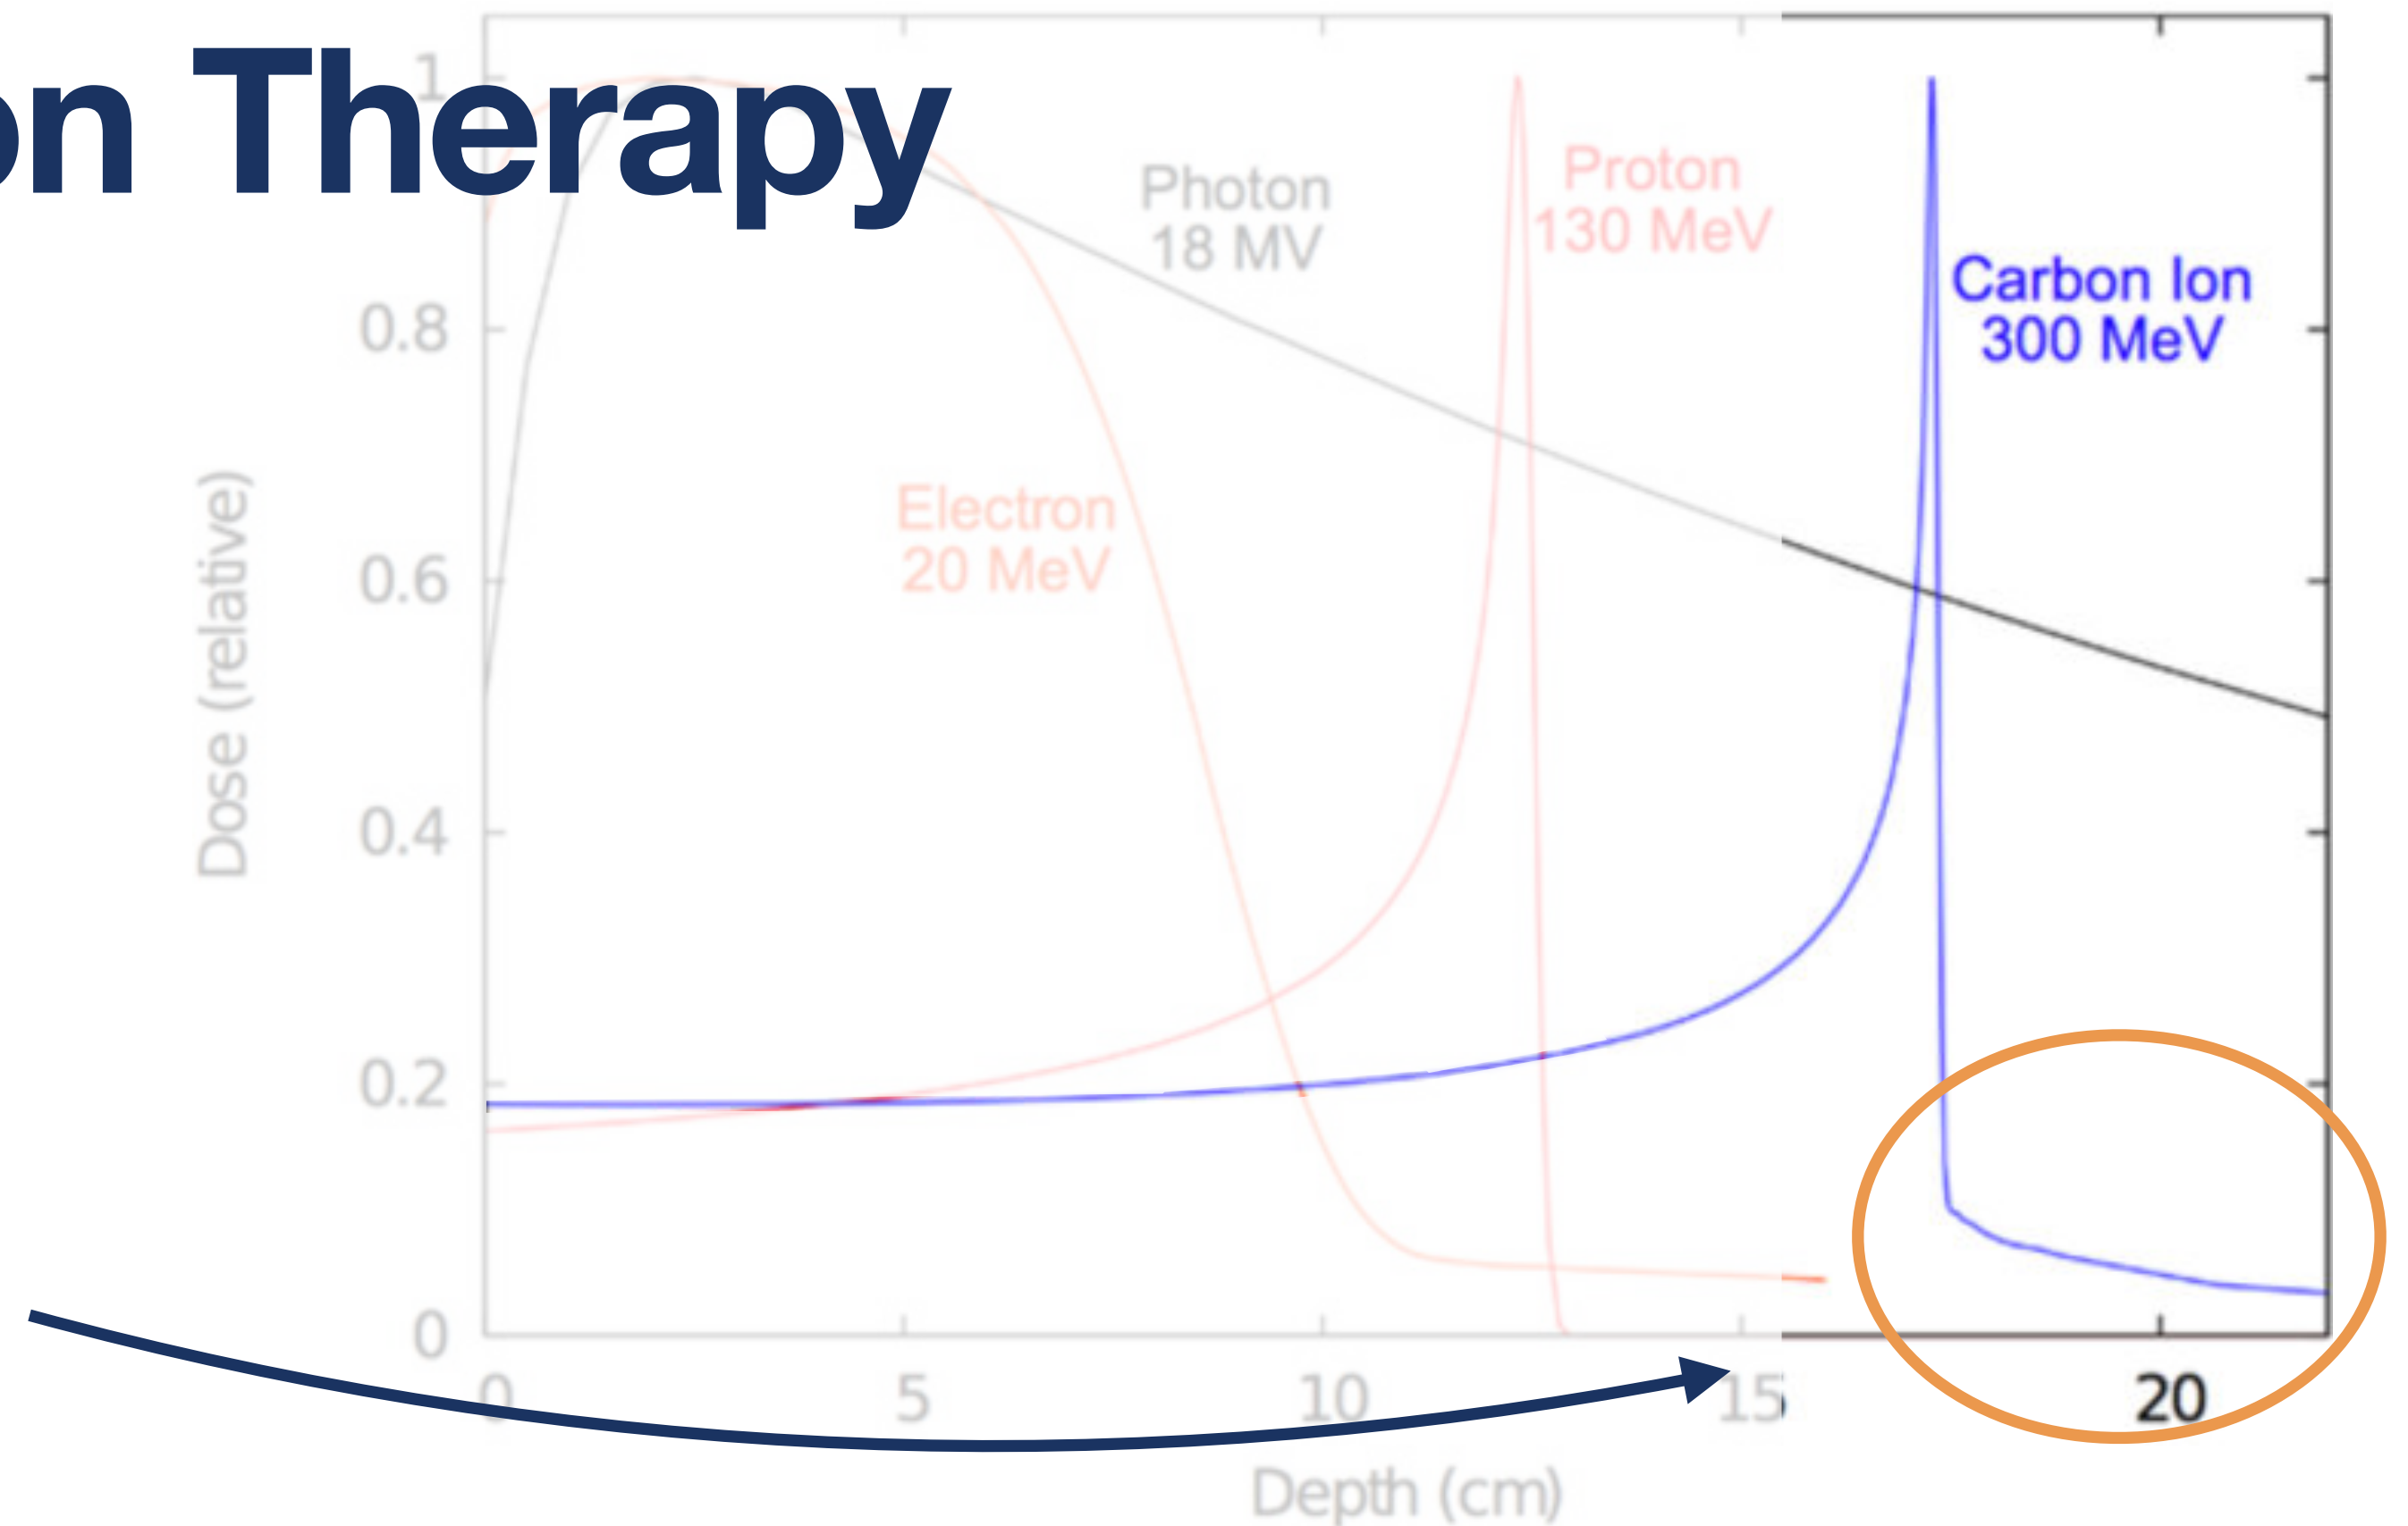

High biological effectiveness

Subject to fragmentation

Responsible for the tail in the dose distribution

Accurate modeling of fragmentation is crucial

Lack of dedicated nuclear interaction models under 100 MeV/u

Deep Learning

Differentiability

Training a Neural Network

Minimization of a *Loss Function*

$$\mathcal{L}_w = |f(X) - \tilde{f}_w(X)|^2$$

Gradient descent

$$\min_w \mathcal{L}_w$$

$$\nabla_w \tilde{f}_w(X)$$

Differentiability

After the training

Fast and Accurate approximation of $f(X)$

Fix the weights $w \longrightarrow \tilde{f}_w(X)$ is **differentiable** with respect to X

Graph Neural Networks

Learning on Graphs

$$\mathcal{G}(V, E)$$

Economics

Molecules

Social Networks

Point Clouds

Physics Simulations

Message passing

Neighborhood information

Process

Aggregate

Learning on
nodes

Learning on
edges

QMD

Quantum extension of the classical molecular dynamics

Nucleons \longrightarrow Gaussian wave packet $\varphi_i(\mathbf{r}) = \frac{1}{(2\pi L)^{3/4}} \exp \left(-\frac{(\mathbf{r} - \mathbf{r}_i)^2}{4L} + \frac{i}{\hbar} \mathbf{r} \cdot \mathbf{p}_i \right)$

Covariant Hamiltonian

$$H = \sum_i \sqrt{\mathbf{p}_i^2 + m_i^2} + 2m_i V_i$$

Equation of motion

$$\dot{\mathbf{r}}_i = \frac{\partial H}{\partial \mathbf{p}_i}, \quad \dot{\mathbf{p}}_i = -\frac{\partial H}{\partial \mathbf{r}_i}$$

QMD Potential

QMD

LiQMD

$$\begin{aligned}
 V_i = & \frac{A}{2\rho_0} \sum_{j \neq i} \rho_{ij} + \frac{B}{\gamma + 1} \frac{1}{\rho_0^\gamma} \left(\sum_{j \neq i} \rho_{ij} \right)^\gamma \\
 & + \frac{g_0}{2\rho_0} \sum_{j \neq i} f_{sij} \rho_{ij} + \frac{g_\tau}{\rho_0^\eta} \left(\sum_{j \neq i} \rho_{ij} \right)^\eta \\
 & + \frac{C_s}{2\rho_0} \sum_{j \neq i} \tau_{3,i} \tau_{3,j} \rho_{ij} (1 - \kappa_s f_{sij}) \\
 & + \frac{\alpha \hbar c}{2} \sum_{j \neq i} \frac{c_i c_j}{|\mathbf{r}_i - \mathbf{r}_j|} \operatorname{erf} \left(\frac{|\mathbf{r}_i - \mathbf{r}_j|}{\sqrt{4L}} \right)
 \end{aligned}$$

Double differential cross sections

Lighter fragments

^{12}C on ^{nat}C at 62 MeV/u

$^1\text{H} - \theta = 11.4^\circ$

$^1\text{H} - \theta = 11.4^\circ$

Double differential cross sections

Heavier fragments

^{12}C on ^{nat}C at 62 MeV/u
