IRN Terascale @ Marseille 2023

26.10.2023

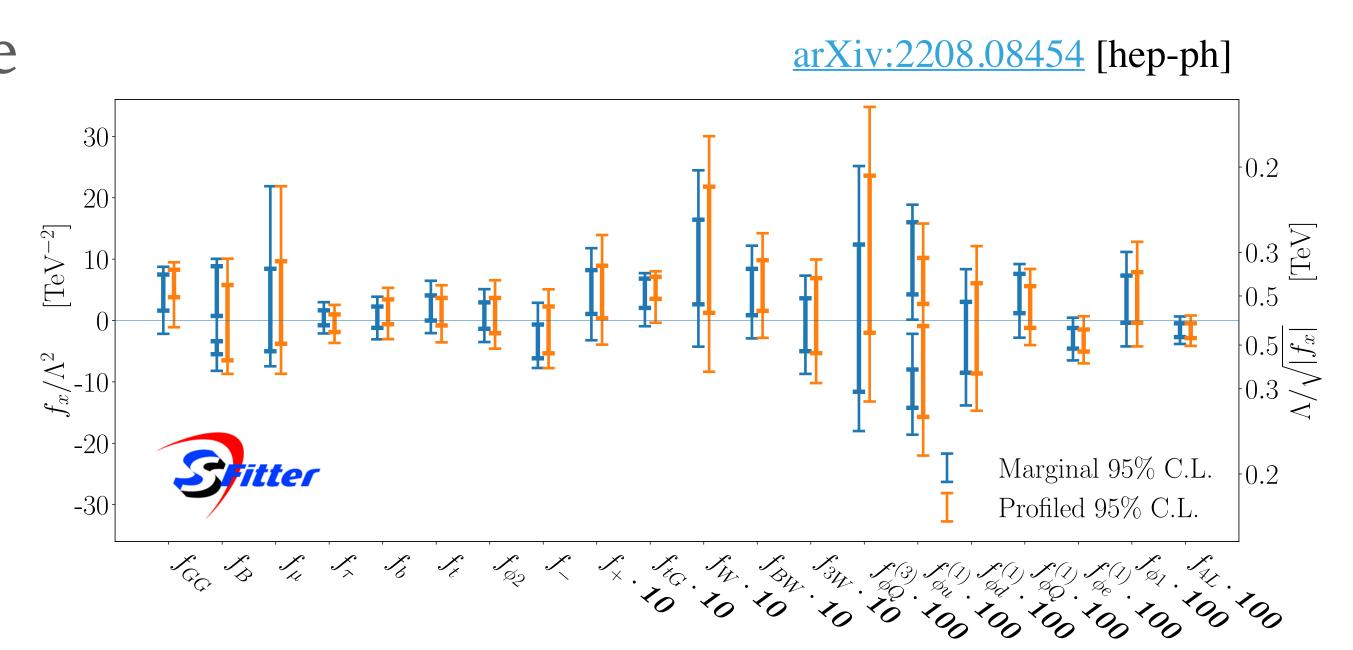

What's the purpose of this talk?

Problem: Large number of observations cannot be explained by the SM alone

► What we do: Global SMEFT analyses using SFitter

► Goal: Put constraints on physics beyond the Standard Model

Outline

► Intro: Standard Model Effective Field Theory

- > Part I: Statistical analysis using SFitter
- Part II: Likelihoods published by ATLAS
- ► Conclusion

Standard Model Effective Field Theory

SMEFT

► Well established model agnostic approach in searches for BSM physics

$\mathcal{L}_{SMEFT} = \mathcal{L}_{S}$

► Up to quadratic order SMEFT contributions included i.e.

$$\sigma = \sigma_{SM} + \frac{c_6}{\Lambda^2}\sigma_6 + \frac{c_6^2}{\Lambda^4}\sigma_{6\times 6} + \frac{c_8}{\Lambda^4}\sigma_8 + \mathcal{O}(\Lambda^5)$$

$$SM + \sum_{d=5}^{n} \frac{C_{i}^{(d)}}{\Lambda^{d-4}} O_{i}^{(d)}$$

Standard Model Effective Field Theory

SMEFT

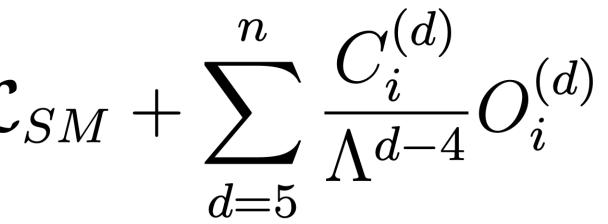

► Well established model agnostic approach in searches for BSM physics

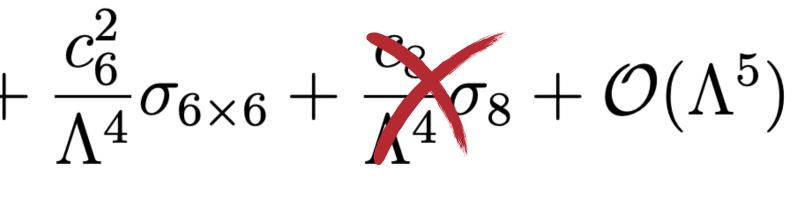

$$\mathcal{L}_{SMEFT} = \mathcal{L}$$

► Up to quadratic order SMEFT contributions included i.e.

$$\sigma = \sigma_{SM} + \frac{c_6}{\Lambda^2}\sigma_6 + \frac{c_6}{\Lambda$$

Restrict ourselves to operators of dimension 6

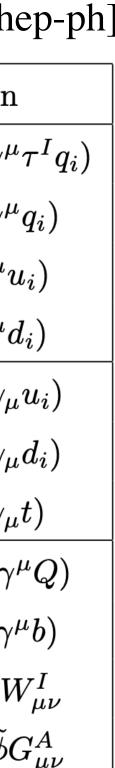

Standard Model Effective Field Theory

Model and dataset

- Restrict ourselves to the Top sector
 Include *tī*, *tīZ*, *tīW* and SingleTop date
 Total ~116 datapoints
- Impose U(2)_q × U(2)_u × U(2)_d symmetries
 Consider a total of 21 Operators

arXiv:1910.03606 [hep-ph]

PART

Statistical analysis with SFitter

What is our tool of choice?

SFitter

- Used for various global SMEFT analyses
- Comprehensive treatment of uncertainties
- **Fully correlated** systematic uncertainties within experiments
- > Allows for both profiling and marginalization methods

► Goal of this talk: Explain what all of this means

The exclusive likelihood

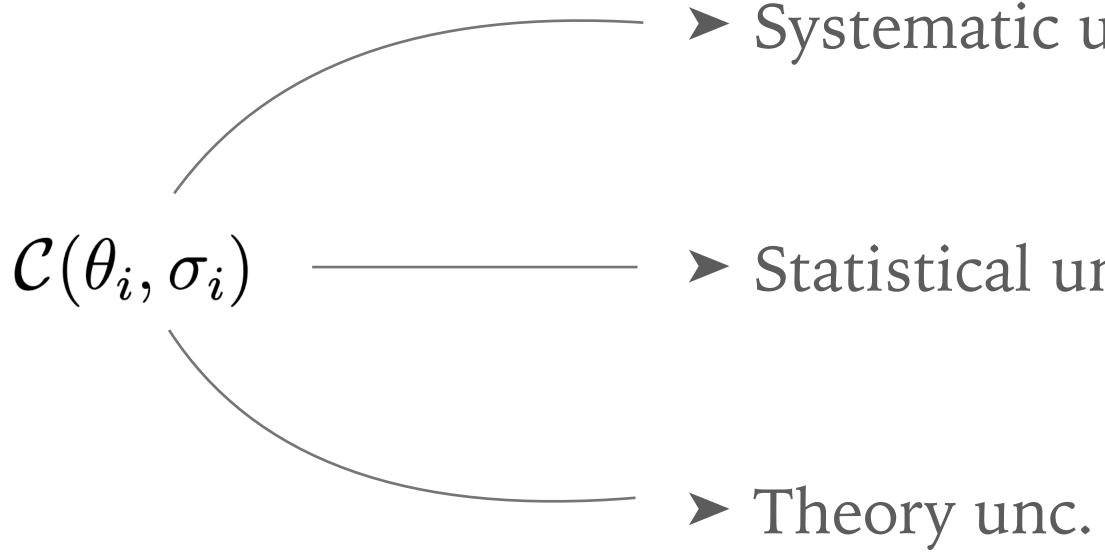

Likelihood for a single measurements modelled as

$$\mathcal{L}_{excl} = \text{Pois}(d|p(\alpha_n, \theta_i, b)) \text{Pois}(b_{CR}|b\,k) \prod_i \mathcal{C}(\theta_i, \sigma_i)$$

- \blacktriangleright SMEFT contributions are incorporated into model parameters α_n
- \blacktriangleright Uncertainties included via nuisance parameters (NP) θ_i
- \blacktriangleright Constraint term $\mathcal{C}(\theta_i, \sigma_i)$ depends on uncertainty considered

Uncertainty constraints

Choice of constraint is motivated by physical intuition

inc.
$$\mathcal{N}(x|\mu,\sigma) = \frac{1}{\sqrt{2\pi\sigma}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)$$

nc.
$$\operatorname{Pois}(n|\nu) = \frac{\nu^n e^{-\nu}}{n!}, \quad \nu > 0$$

$$\mathcal{F}(x|\mu,\sigma) = \frac{1}{2\sigma}\Theta\left[x - (\mu - \sigma)\right]\Theta\left[(\mu + \sigma) - x\right]$$

- > However: They are a choice and could technically be chosen differently

Generalization to multiple measurements

Global analyses study numerous different processes

$$\mathcal{L}_{\text{excl,full}} = \prod_{c} \text{Pois}(d_c | p_c) \text{Pois}(b_{CR_c} | b_c \, k_c) \prod_{i} \mathcal{C}(\theta_{i,c}, \sigma_{i,c})$$

- ► Take into consideration correlations between these measurements $\mathcal{N}(heta_{syst,i}|0,\sigma_i)$ -
- Assumption: Systematics are fully correlated between measurements

$$\longrightarrow \mathcal{N}(\vec{\theta}_{syst,i}|\vec{0}, \Sigma_i)$$

Systematic uncertainties

- Each category of systematic is fully correlated within CMS and ATLAS
- Luminosity correlated between both experiments

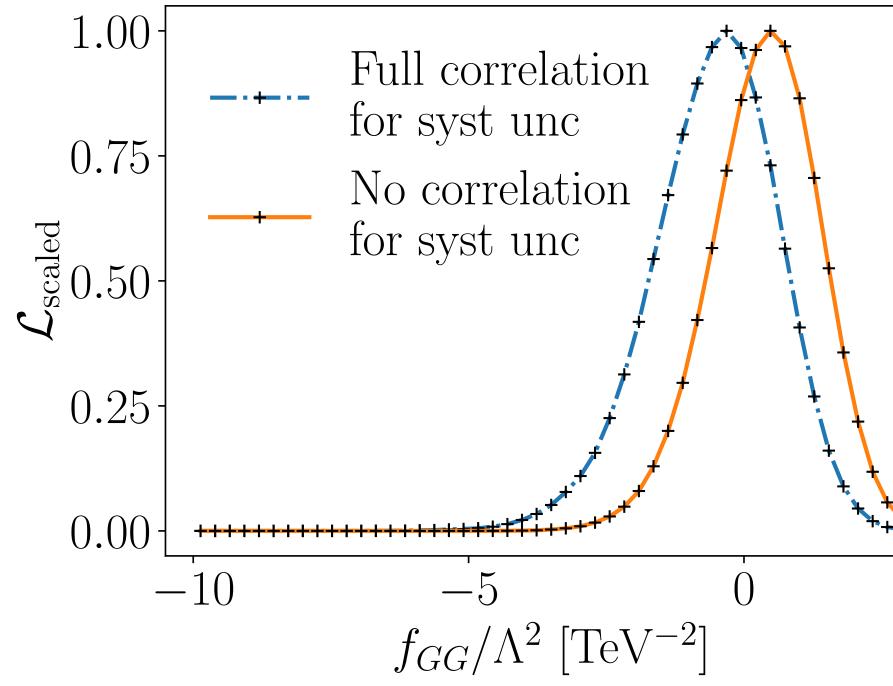

Systematic uncertainties Beam Background (Separate for each channel) ETmis Jets Leptons LightTagging Luminosity Pileup Trigger Tune bTagging partonShower tTagging tauTagging

.

Systematic uncertainties

- Each category of systematic is fully correlated within CMS and ATLAS
- Luminosity correlated between both experiments
- Clear shift in the likelihoods due to correlations between the systematics

arXiv:2208.08454 [hep-ph]

To profile or to marginalize

Common exclusive likelihood constructed

$$\mathcal{L}_{excl} = \operatorname{Pois}(d|p(\alpha_n, \theta_i))$$

> The NPs θ_i are not physically interesting

(b, b))Pois $(b_{CR}|b\,k) \prod C(\theta_i, \sigma_i)$ 2

To profile or to marginalize

Common exclusive likelihood constructed

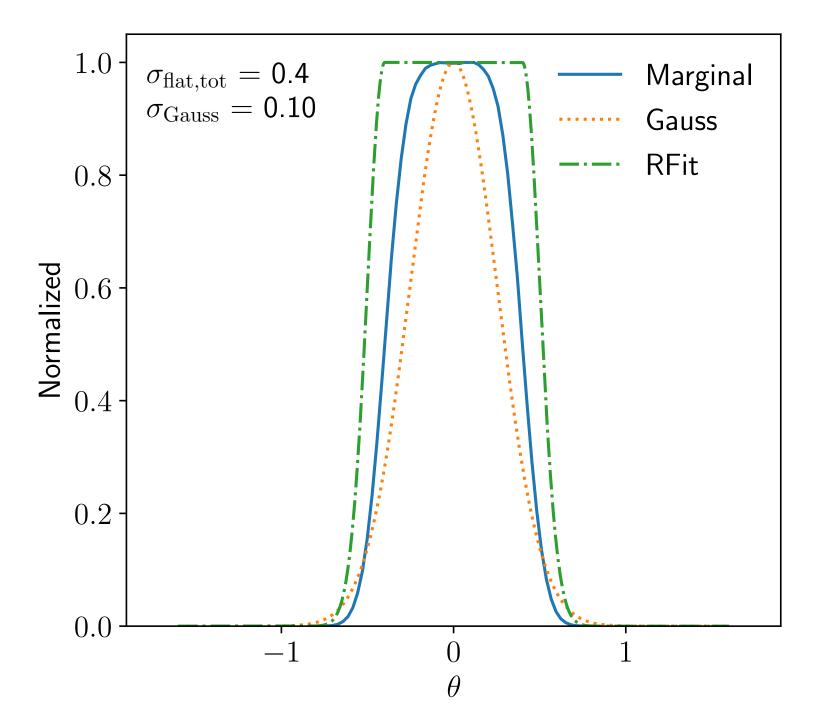

$$\mathcal{L}_{excl} = \operatorname{Pois}(d|p(\alpha_n, \theta_i))$$

> The NPs θ_i are not physically interesting > **Decision:** How do we handle the NPs? **Profiling:** $\mathcal{L}_{\text{prof}}(\alpha) = \max \mathcal{L}_{\text{excl}}(\alpha, \theta)$ θ

(b, b))Pois $(b_{CR}|b\,k)$ $\mathcal{C}(\theta_i, \sigma_i)$

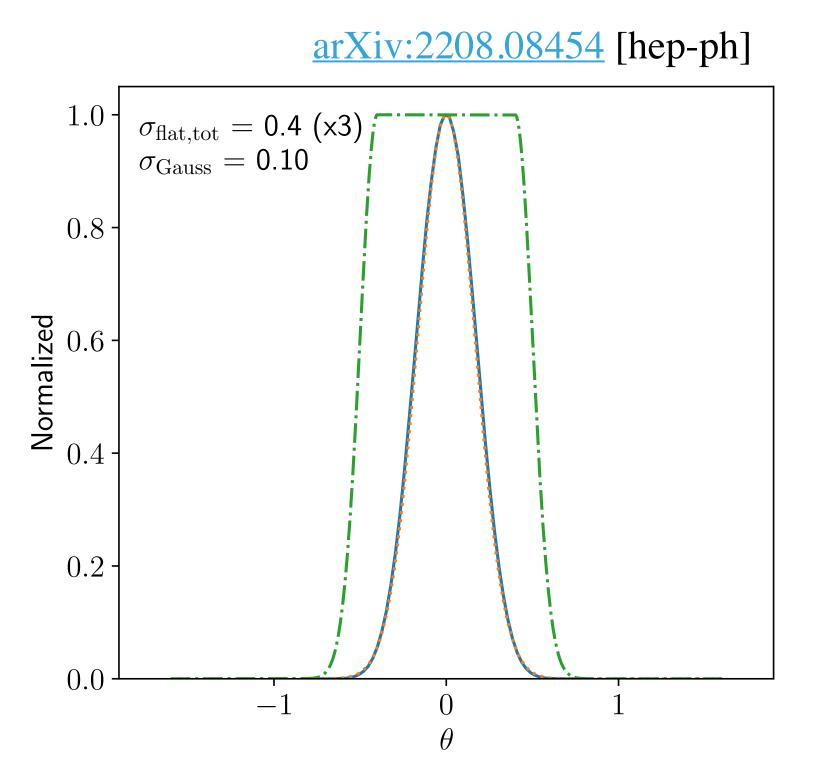

Marginalization: $\mathcal{L}_{marg}(\alpha) = \int d\theta \mathcal{L}_{excl}(\alpha, \theta)$

To profile or to marginalize

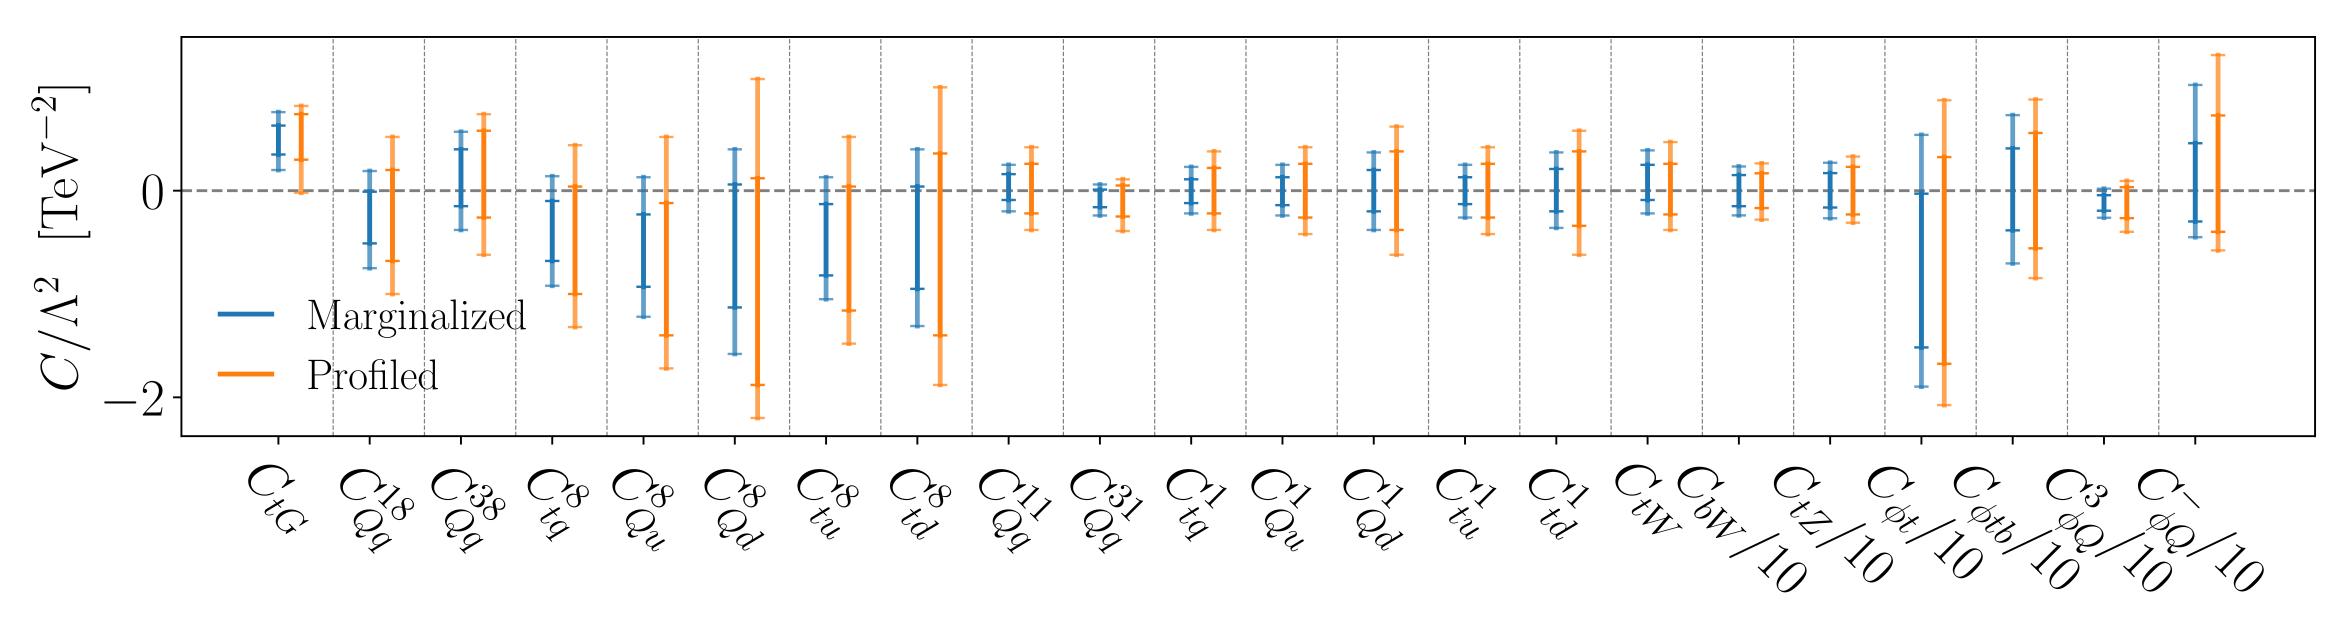

Comparison for the product of Gaussian and uniform distributions

> Marginalization over multiple flat unc. gives Gaussian results

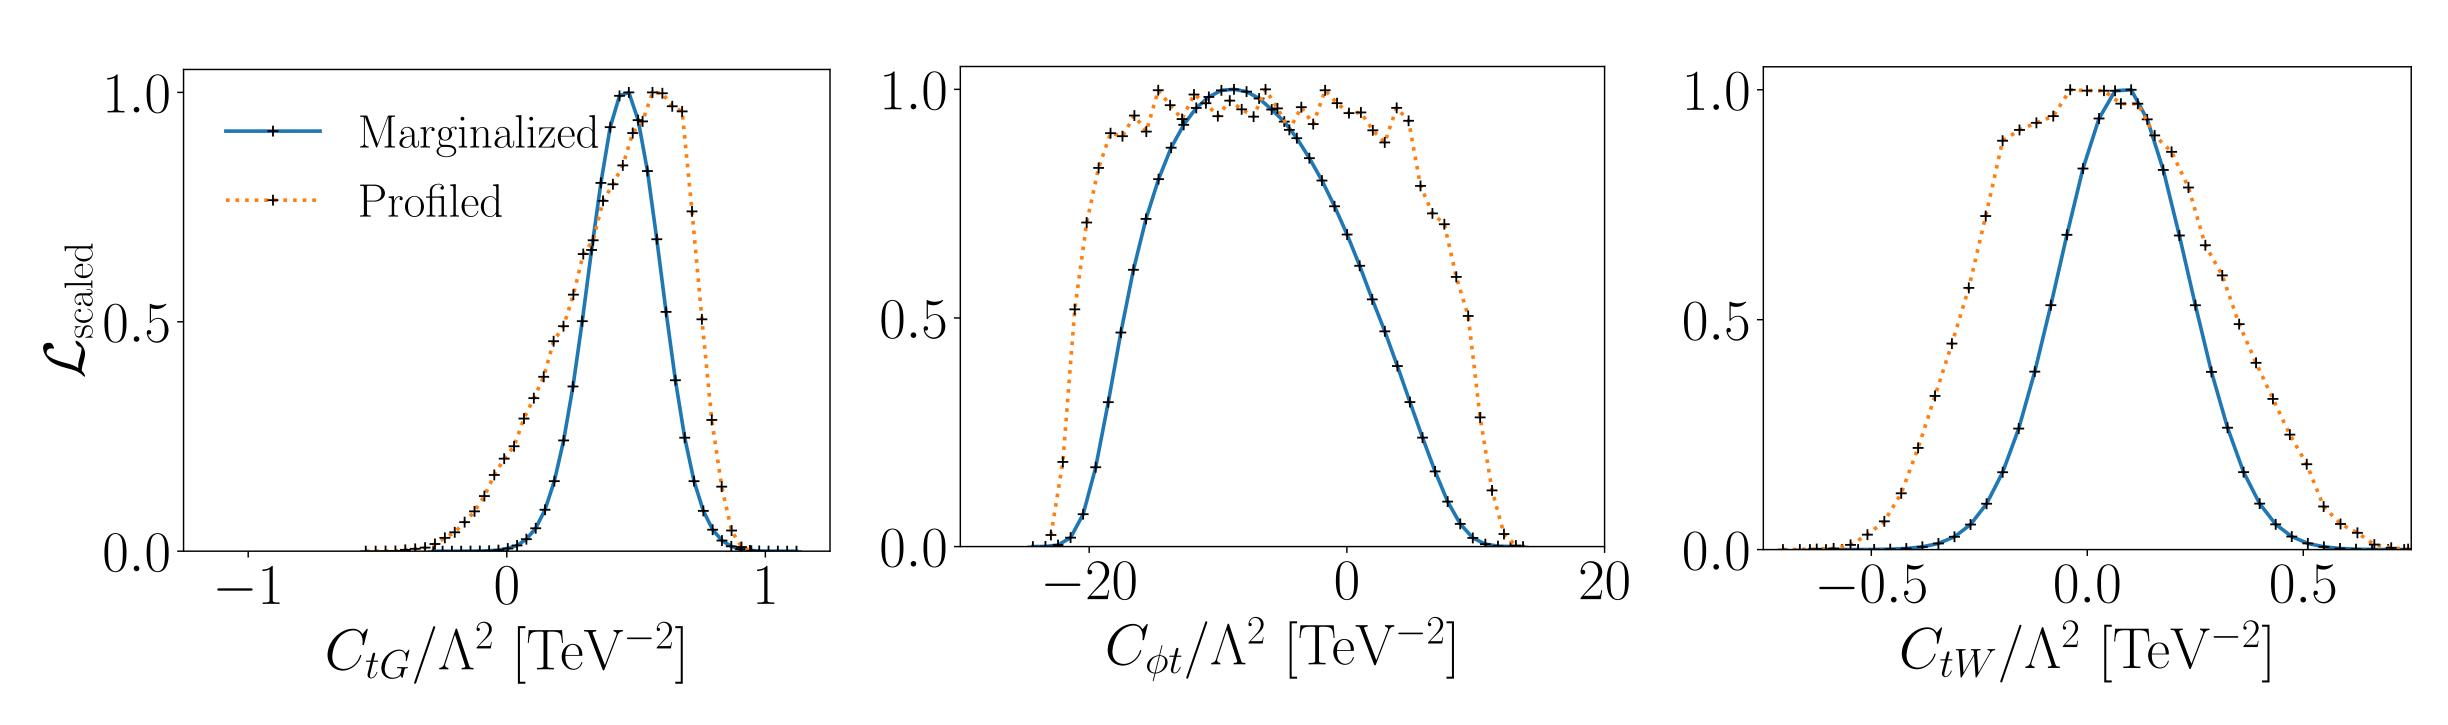

Profiling vs Marginalization

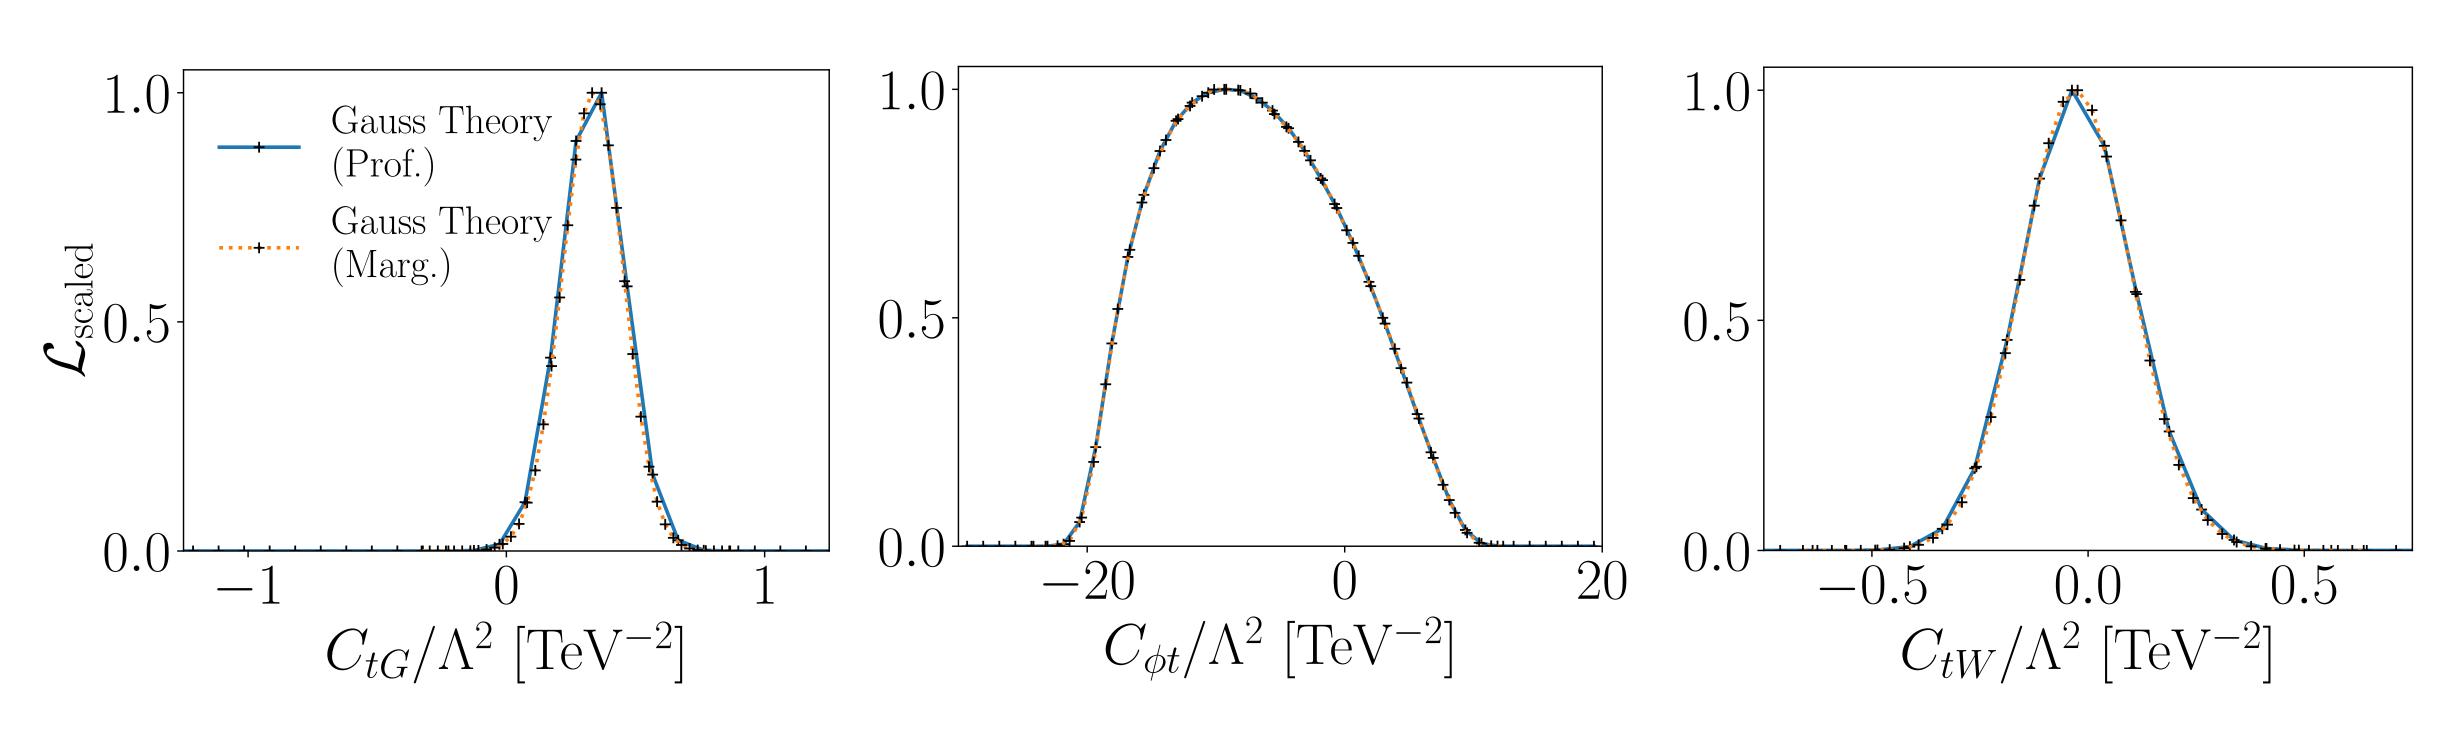

Stronger constraints for marginalized likelihood as a result of large theory uncertainties

Profiling vs Marginalization

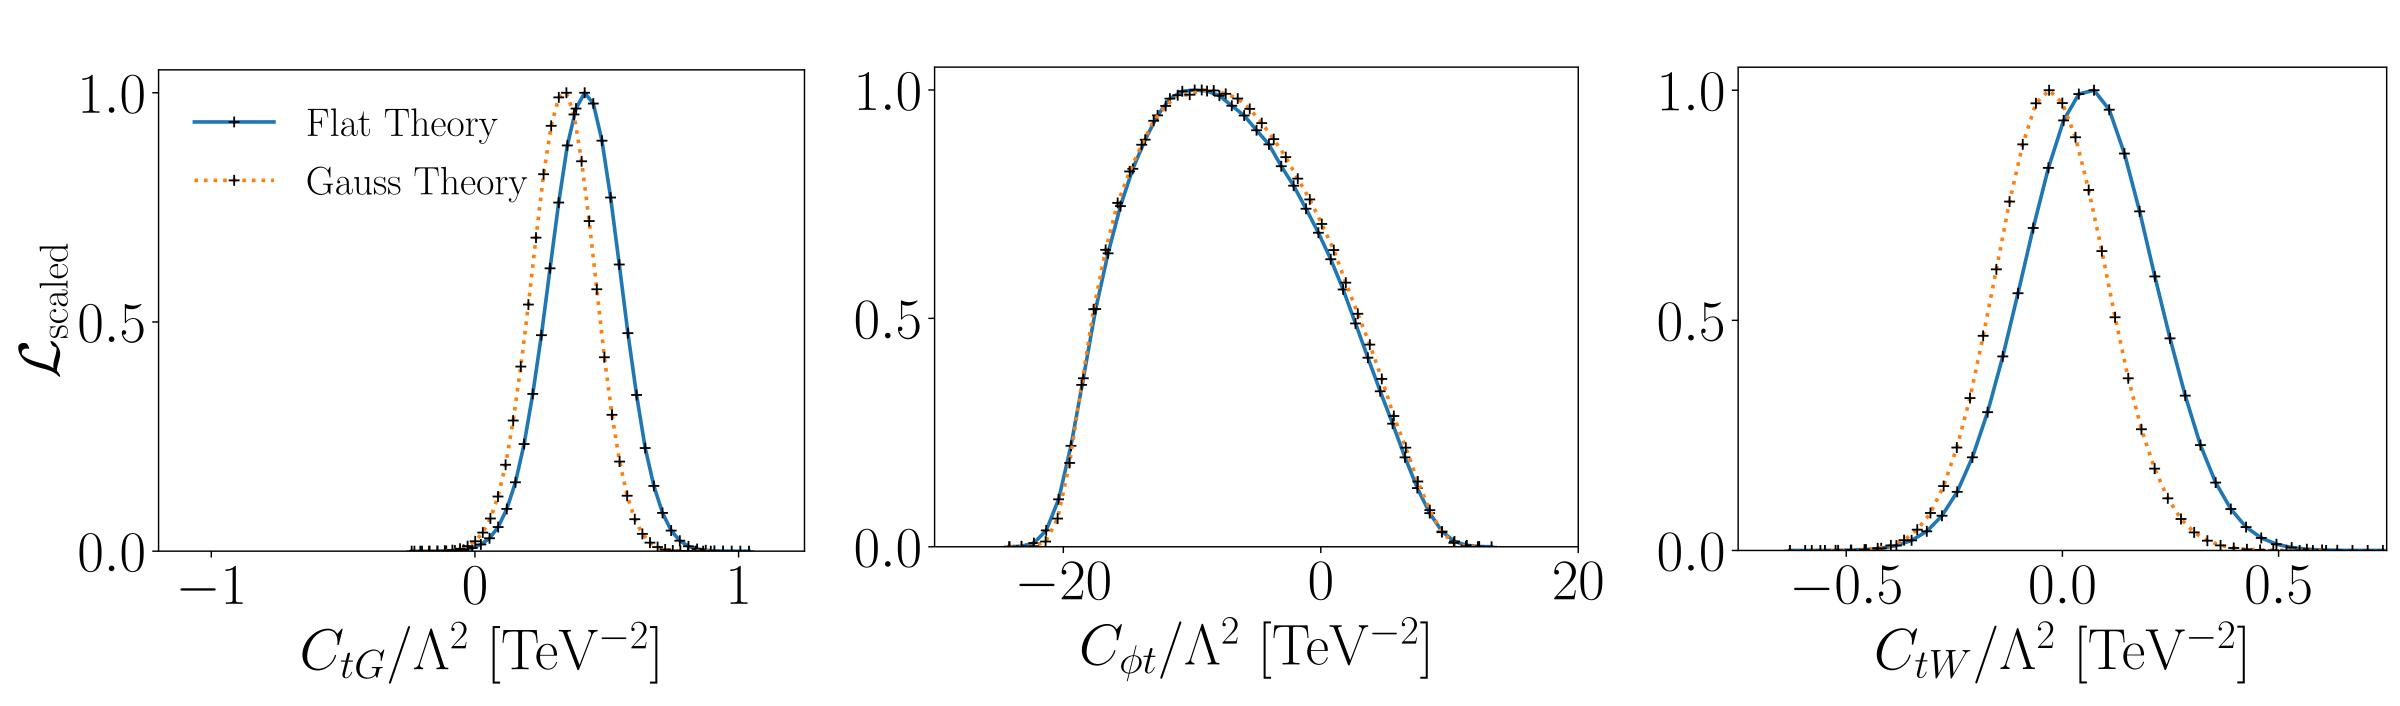

Expected behaviour due to marginalization of flat theory uncertainties

Profiling vs Marginalization

► Gaussian theory unc. give same result for both profiling and marginalization

Profiling vs Marginalization

> However: Choice of Gaussian or uniform still has an effect

Gaussian theory unc. give same result for both profiling and marginalization

Measurements of the inclusive and differential production cross sections of a top-quark-antiquark pair in association with a Z boson at $\sqrt{s} = 13$ TeV with the ATLAS detector

ATLAS Collaboration*

CERN, 1211 Geneva 23, Switzerland

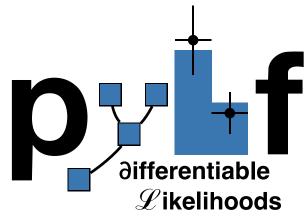

Received: 24 March 2021 / Accepted: 10 July 2021 / Published online: 16 August 2021 © CERN for the benefit of ATLAS Collaboration 2021

Quick overview

- Likelihoods published in the HistFactory format $\mathcal{L}(n_{cb}, a_{\chi} | \eta, \chi) =$ $c \in \text{channels } b \in \text{bins}$
- \blacktriangleright Full statistical model with NPs χ and parameters of interest η
- > Allows analysis of **individual NPs** of the likelihood
- > Analysis using dedicated python libraries such as **pyhf** and **cabinetry**
 - Question: How to make use of in SFitter analyses?

Pois
$$(n_{cb}|\nu_{cb}(\eta,\chi))\prod_{\chi\in\vec{\chi}}\mathcal{C}_{\chi}(a_{\chi}|\chi)$$

Uncertainties

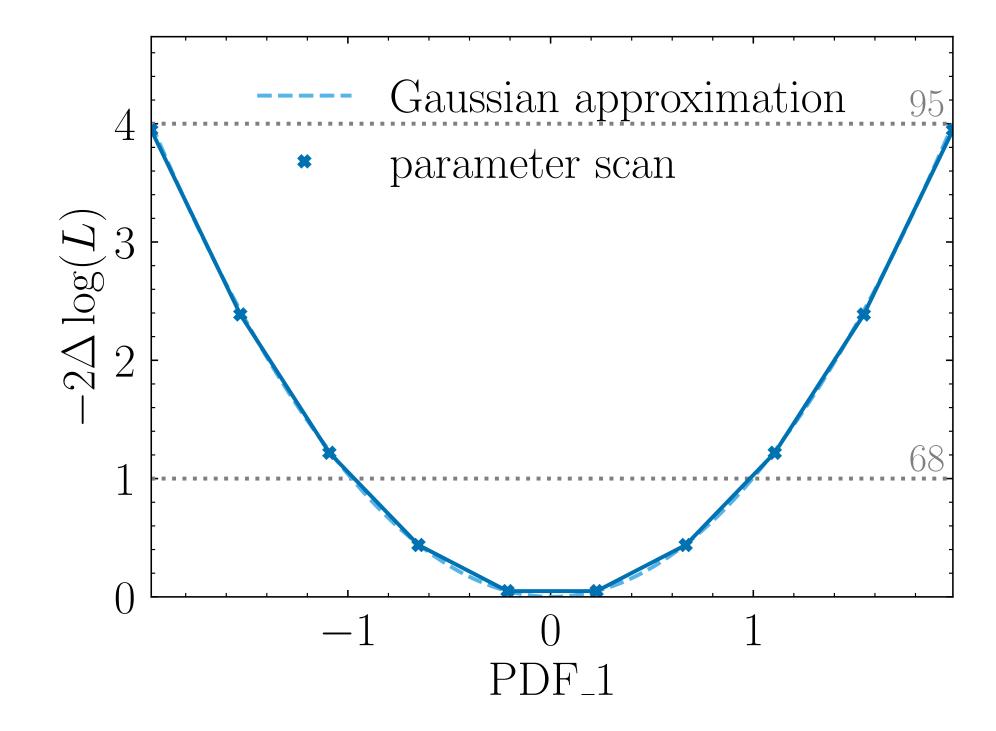

- Previously: Uncertainties taken as given in the paper
- Now: Uncertainties extracted from profiling fit via pyhf
 - ► Implemented into SFitter using the constraints terms $C(\theta_i, \sigma_i)$
- Problem: Difficult to automate due to inconsistent naming conventions

Uncertainty	Reproduced $\frac{\Delta \sigma_{t\bar{t}Z}}{\sigma_{t\bar{t}Z}}$ [%]	Paper $rac{\Delta\sigma_{t\bar{t}Z}}{\sigma_{t\bar{t}Z}}$

Parameter scans

► NPs are all very Gaussian, only small number of exceptions

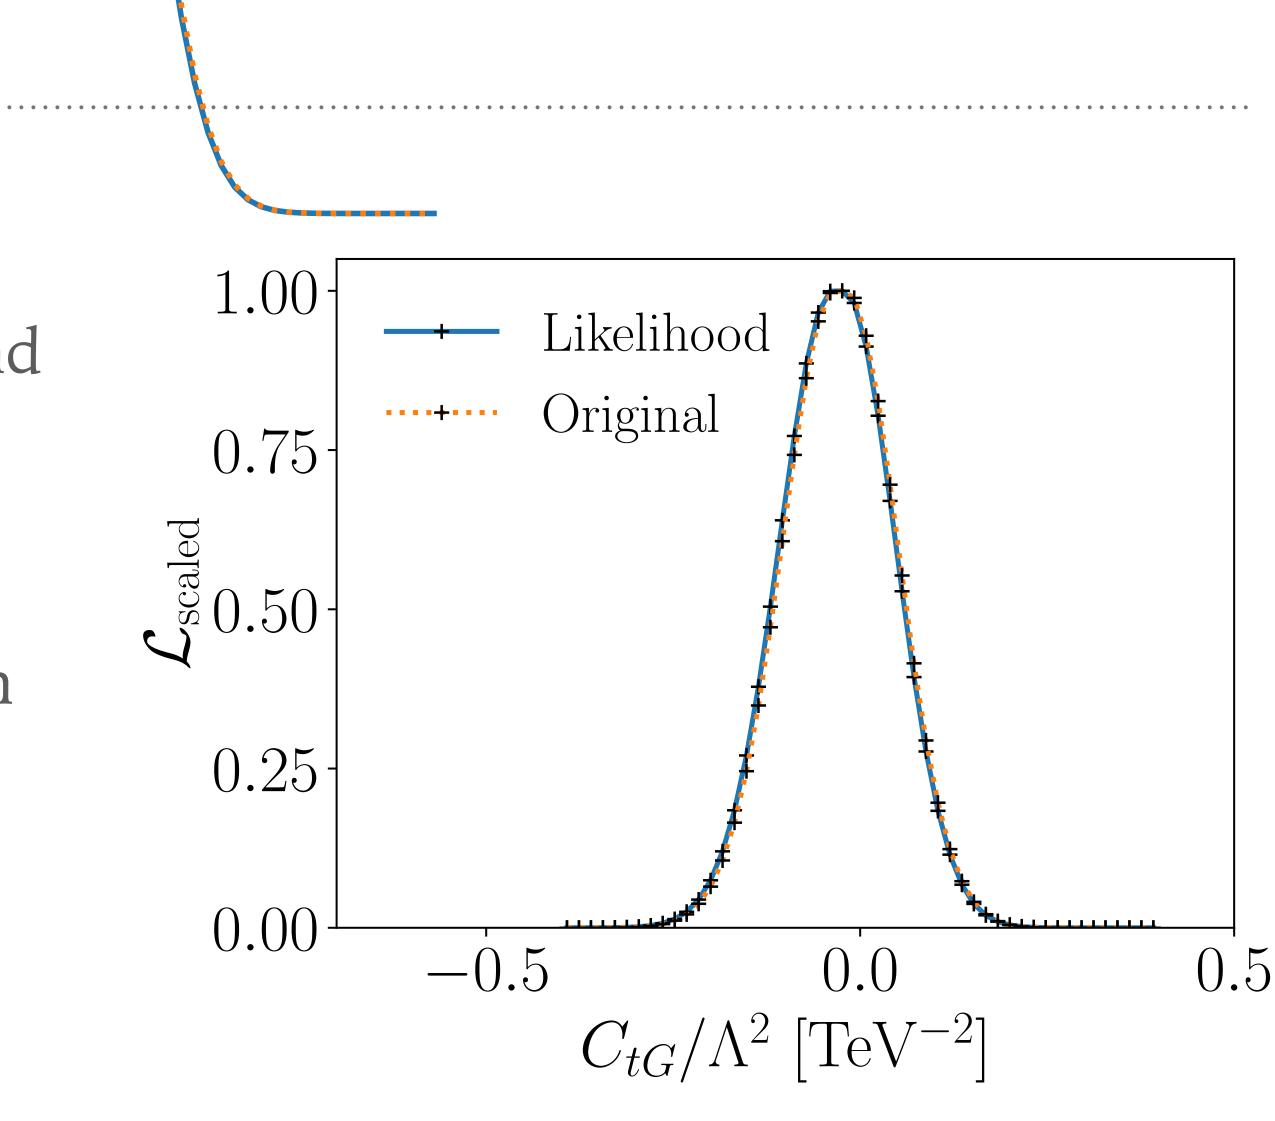

► Modeling systematics as **Gaussian** is a reasonable assumption

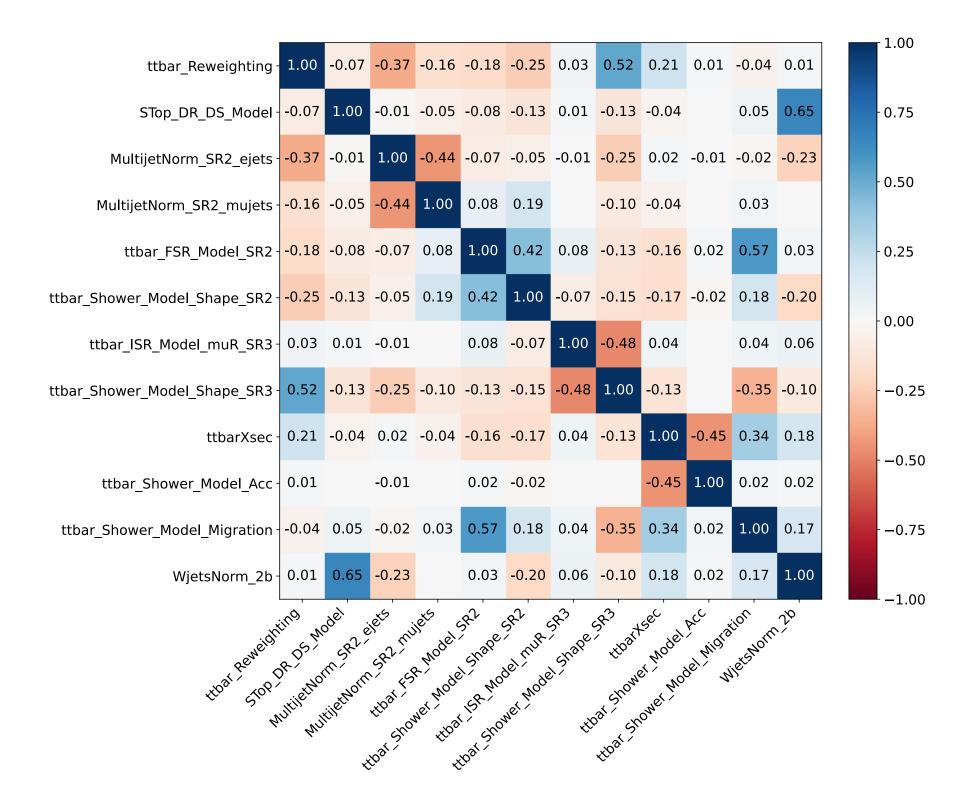

Implementation

- ► Low dimensional fit to only C_{tG} and total cross section measurements
- Neglect theory uncertainties
- Excellent agreement between both methods of implementation

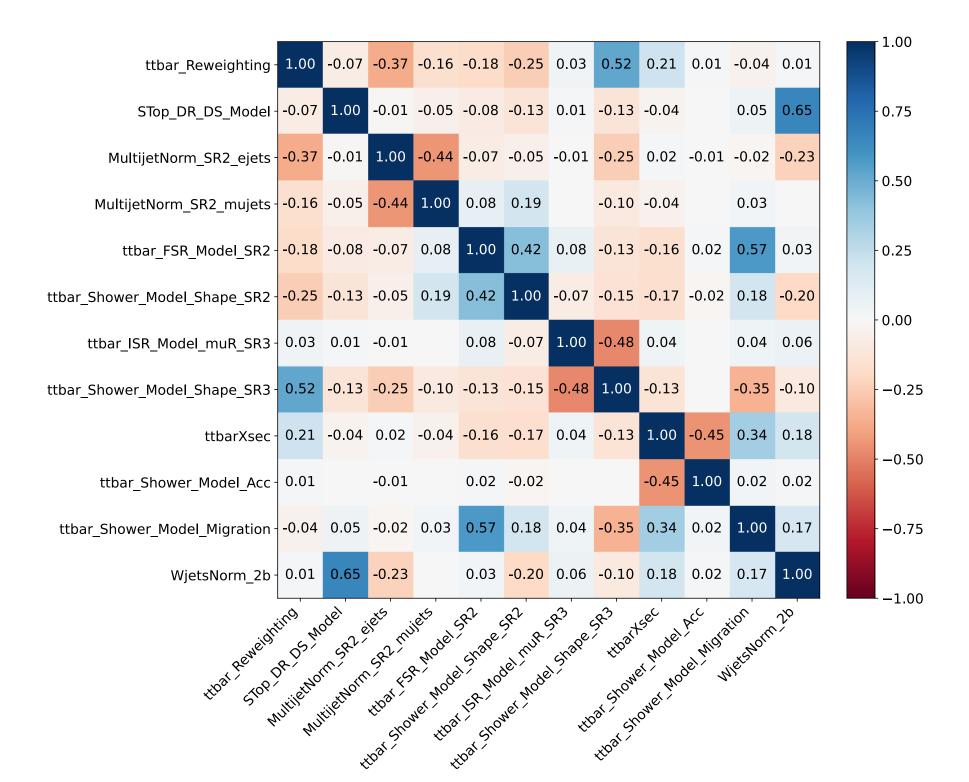

Concerning Correlations

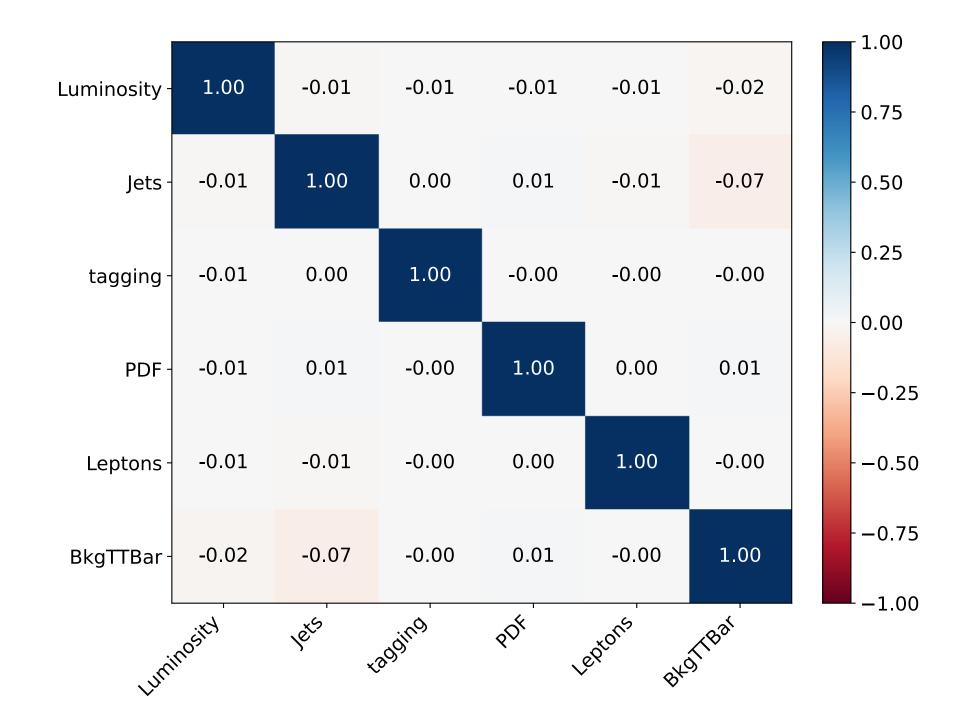

Currently: No correlations between uncertainties in SFitter

Concerning Correlations

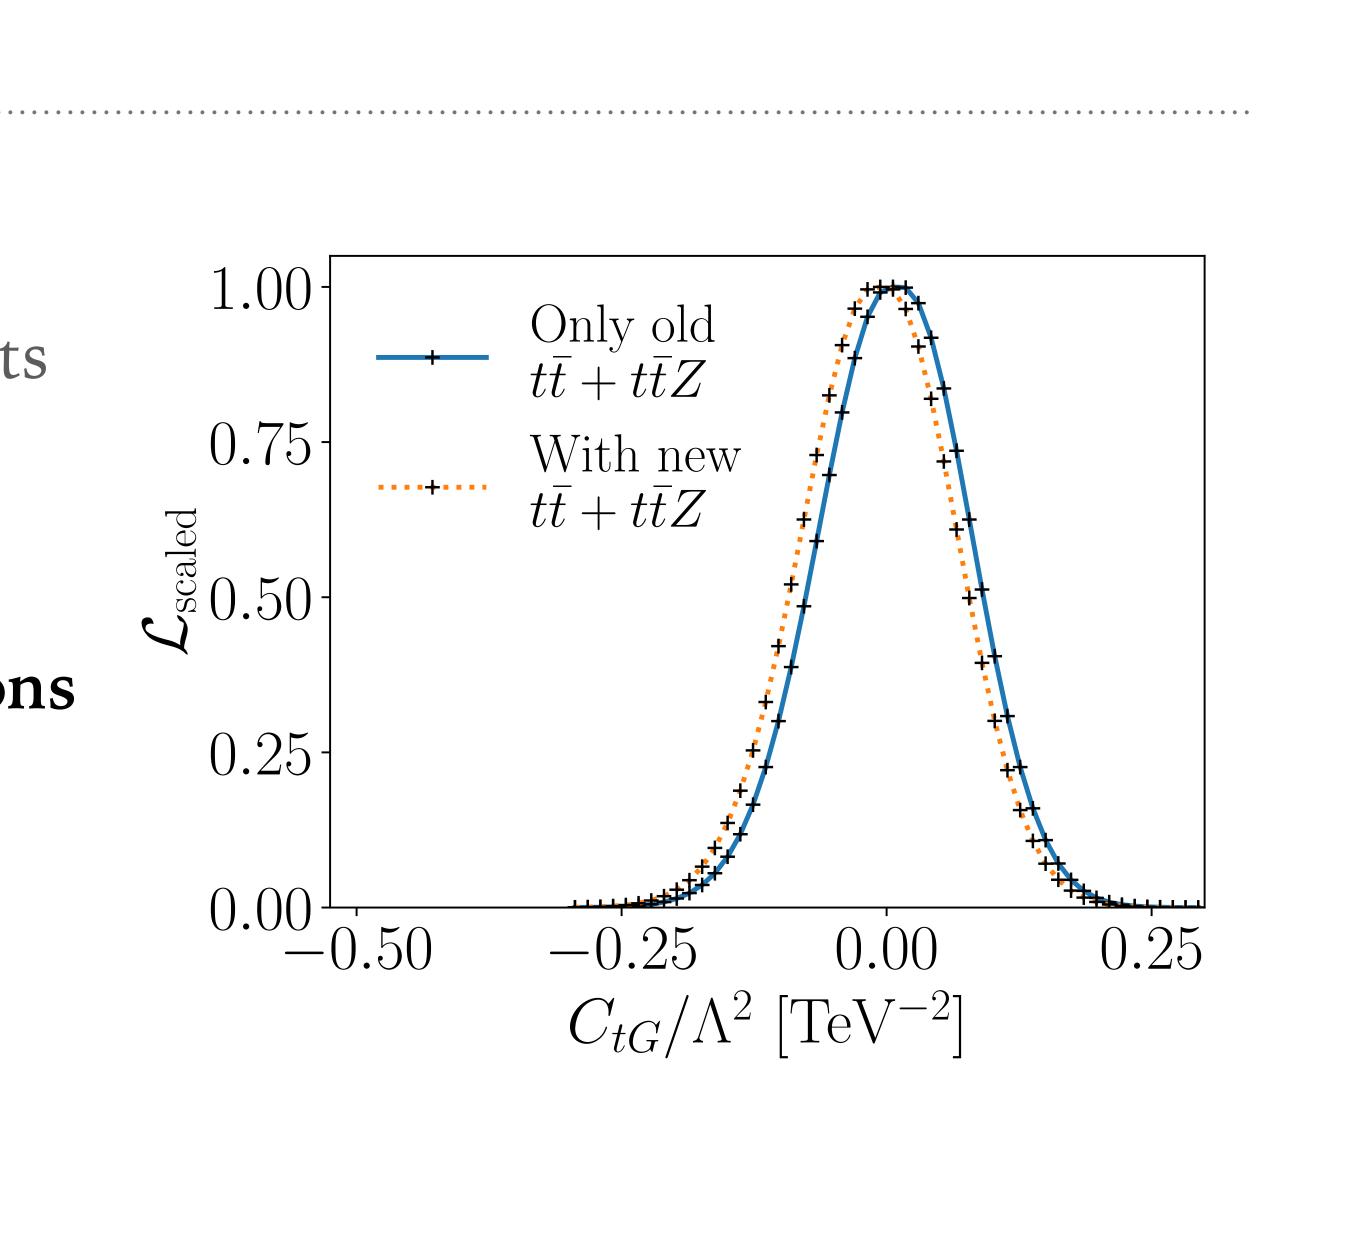

Currently: No correlations between uncertainties in SFitter
 Correlations of systematics included in SFitter are negligibly small

Constraints

- Visible shift from new measurements
- Constraints shift slightly after including both new measurements
- Measurements of total cross sections barely affect constraints

Concluding

- **Summary:** SFitter constraints using either profiling or marginalization methods Large effect of theory uncertainties in the top sector
- - > Published likelihoods provide an alternative way to use experimental data > Validates assumptions made in previous analyses

- However: Current published likelihoods not particularly SMEFT sensitive > Publication for more differential measurements would be beneficial

 - Check effect of SMEFT in profiling fit of published likelihoods

Thank you for your attention.

- Nikita Schmal
