

# Random point processes in the plane and applications to birds of prey

Gernot Akemann

(University of Bristol & Bielefeld University)

Philippe 60, 26.06.2024

with M. Baake, N. Chakarov, O. Krüger, A. Mielke,  
M. Ottensmann, P. Päßler, R. Werdehausen

[J. Th. Biol. **509** (2021) 110475; J. Stat. Mech. (2024) 053501]

# Outline

- I) Examples for point processes from ecology
- II) Mathematical description: Poisson, Ginibre, interpolation
- III) Application to birds of prey in the Teutoburger Wald
- IV) Discussion

# I) Example spacial patterns of trees

- ▶ (a) beech (b) Norway spruce (c) silver fir in a 1-ha plot at Rothwald, Austria (circles  $\sim$  d.b.h.)

from [R. Law et al., *J. Ecology* **97** (2009) 616–628]

- ▶ quantify influence of **environment** (nutrition, terrain, etc.), **population density**, **interaction of species**

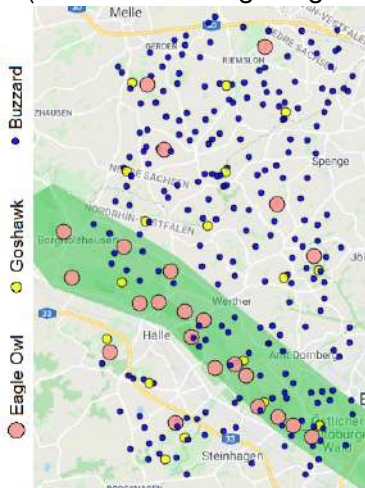

# Example spacial patterns of nests of birds of prey

Left: nests of **Buzzard** in 2020 (data: Oliver Krüger's group)

# Example spacial patterns of nests of birds of prey

Left: nests of **Buzzard** in 2020 (data: Oliver Krüger's group)

Right: include **Goshawks** and **Eagle Owl**

## Interaction of species

- ▶ Buzzard, Goshawk and Eagle Owl [\[wikipedia\]](#)
- ▶ can we quantify their interaction (repulsion) based on the annual distribution of nests?

## II) Math description: Independent points = Poisson

- ▶ **1D vs. 2D Poisson:** independent points in interval / disc
- ▶ **nearest neighbour spacing distribution**

- ▶  $P_{2D}(S) = \frac{1}{2}\pi S e^{-\pi S^2/4}$  vs.  $P_{1D}(S) = e^{-S}$

2D repulsion  $\sim S$  from area measure vs. 1D no repulsion

# Random matrix eigenvalues: Ginibre ensembles

- ▶  $P(J) \sim \exp \left[ -\text{Tr} JJ^* \right]$  for  $J_{ij} \in \mathbb{R}/\mathbb{C}/\mathbb{H}$  [Ginibre '65]

- ▶ complex eigenvalues: determinantal / Pfaffian process
- ▶ in bulk  $\setminus \mathbb{R}$  **all** local eigenvalue correlations **equal** GinUE: GinOE [Borodin, Sinclair '08], GinSE [A, Kieburg, Mielke, Prosen '19]

- ▶  $P_{\text{Gin}}(\mathbf{s}) = -\frac{\partial}{\partial \mathbf{s}} \prod_{j=1}^{\infty} \frac{\Gamma(j+1, \mathbf{s}^2)}{\Gamma(j+1)}$   $\sim \mathbf{s}^{2+1}$  [Grobe, Haake, Sommers '88]

# Bulk spacing: 3 Ginibre Ensembles vs. GO/U/SE

- ▶ 2D: numerical simulations of 3 Ginibre ensembles  $\beta = 2$  (left)
- ▶ 1D: Wigner surmise for GOE, GUE, GSE  $\beta = 1, 2, 4$  (right) with  $\sim S^\beta$

# Interpolating Poisson to correlated points

- \* Proposal 1: (e.g. [Møller et al. 2018])

- **assume** point process is **determinantal**, kernel  $K_N(z, u)$ :

$$R_k(z_1, \dots, z_k) = \det_{k \times k}[K_N(z_i, z_j)] \text{ for all } k\text{-th marginals:}$$

- e.g.  $R_1(z) = K_N(z, z)$  density

- **fit kernel**  $K_N(z_1, z_2)$  from data via connected  $R_2(z_1, z_2)$

- ▶ **Poisson**:  $\rightarrow$  diagonal Kernel  $K_N(z_i, z_j) \sim \delta_{i,j} f(z_i)$ :

$$\Rightarrow R_k(z_1, \dots, z_k) = \prod_{i=1}^k K_N(z_i, z_i)$$

- \* Proposal 2:

- **assume** point process is **2D Coulomb gas** at  $\beta > 0$

- **fit**  $\beta$  from data

- ▶ **Poisson**:  $\beta \rightarrow 0$

- ▶ successfully applied in non-Hermitian Quantum chaos  $\rightarrow$  integrable transition [A, Kieburg, Mielke, Prosen '19]

## 2D Coulomb gas picture for complex eigenvalues

$$\begin{aligned} P_N(z_1, \dots, z_N) &= \frac{1}{Z_N(\beta)} \exp \left[ \beta \sum_{j>k}^N \ln |z_j - z_k| - \sum_{i=1}^N |z_i|^2 \right] \\ &= \frac{1}{Z_N(\beta)} \prod_{j>k}^N |z_j - z_k|^\beta e^{-\sum_{i=1}^N |z_i|^2} \end{aligned}$$

- ▶ **joint complex eigenvalue density:**  
complex Ginibre = static **2D Coulomb gas** at  $\beta = 2$
- ▶ **unknown:** Selberg integral in the complex plane

$$Z_N(\beta) = \int_{\mathbb{C}^N} d^2 z_1 \cdots d^2 z_N \prod_{j>k}^N |z_j - z_k|^\beta e^{-\sum_{i=1}^N |z_i|^2}$$

$$Z_{N=2}(\beta) = (2\beta)! 2^{2\beta}; \quad Z_{N=3}(\beta) = \frac{(6\beta)!}{2^{2\beta}} \sum_{k=0}^{2\beta} 3^{2k} \frac{\binom{2\beta}{k}^2}{\binom{6\beta}{2k}}, \quad \beta \in \mathbb{N}$$

[Di Francesco, Gaudin, Itzykson, Lesage, '94]

- ▶ at  $\beta \approx 142$  **condensation (!)** to Abrikosov lattice  
[Choquard, Cl erouin '83; Cardoso, St eph an, Abanov '20]

# Known local correlations in 2D Coulomb at $\beta > 0$

- ▶  $\beta = 0$ : vicinity of zero  $\beta \sim \kappa/N$ : local statistics Poisson, universal [Lambert '21]
- ▶  $\beta = 2$ : Ginibre = integrable, determinantal point process [Ginibre '65, Haake et al. '88], universal
- ▶  $0 < \beta < 2$ : **numerical simulation**: nearest and next-to-nearest neighbour

or **approximate: 2D "surmise"** [A., Mielke, Päßler '22]

$$P_{\beta}(s) = \frac{2\alpha^{1+\beta/2}}{\Gamma(1+\beta/2)} s^{\beta+1} e^{-\alpha s^2}, \quad \alpha = \frac{\Gamma((3+\beta)/2)^2}{\Gamma(1+\beta/2)^2}$$

heuristics matches

- ▶ 2D good approximation for  $\beta$  small ( $\neq$  1D Wigner surmise, for  $\beta$  large)
- global statistics: loop equations [Zabrodin, Wiegmann '06, Chekhov, Eynard, Marchal '11]

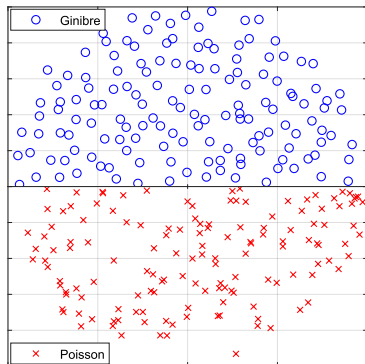

## Numerical 2D Coulomb spacing distribution at $\beta \geq 0$

- Examples for nearest neighbour spacing distribution, do fits in steps 0.1

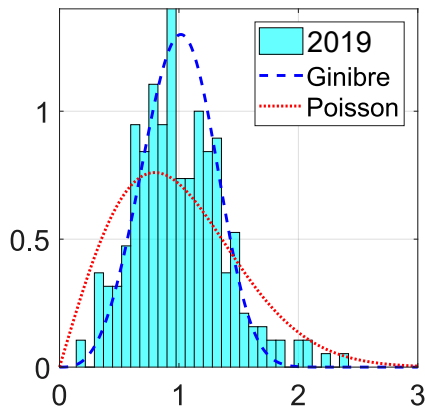

[A, Kieburg, Mielke, Prosen '19]

### III) Buzzard nest distribution: Poisson or Ginibre?

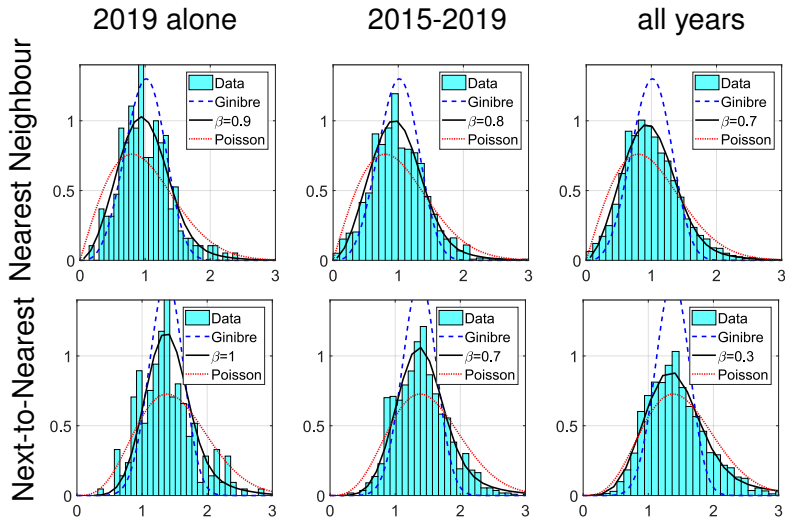

- ▶ Left: Top half eigenvalues of Ginibre ensemble vs. bottom half 2D Poisson
- ▶ Right: Buzzard nest distribution 2020

# Buzzard Nests $\neq$ Poisson nor Ginibre

→ single parameter fit to  $\beta$  in 2D Coulomb gas

# Time moving average: 1y, 5y, 20 y for Buzzards

► fit more years:  $\beta$  changes

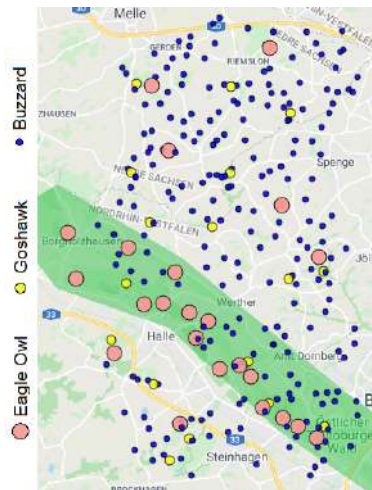

# Time dependent repulsion vs. population size

- ▶  $\beta$  for NN and NNN (left) vs. population (right), both 5 y ave
- ▶ **linear increase** in both repulsion and population size
- ▶ **unfolding**: trivial decrease of spacing through increased density (population per area) is removed
- ▶ above population threshold:  $\beta_{NN} \approx \beta_{NNN}$  comparable

# Comparison and interaction among 3 species

- ▶ fit repulsion **within each species** and compare
- ▶ fit repulsion **between each two species**

# 3 Species: 1y vs. 10 y vs 20 y Nearest neighbours

Buzzards  $\beta \approx 0.6$  (3377 spacings), Goshawks  $\beta \approx 0.8$  (423),  
Eagle Owls  $\beta \approx 0.5$  (174)

# Time dependent repulsion vs. population: 10 y ave

## $\beta$ -fit Goshawks

## $\beta$ -fit Eagle Owls (F)

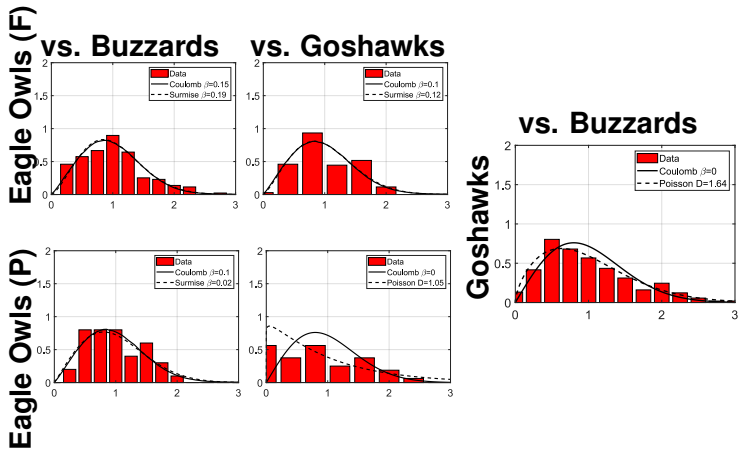

## Goshawk population

## Eagle Owl (F) population

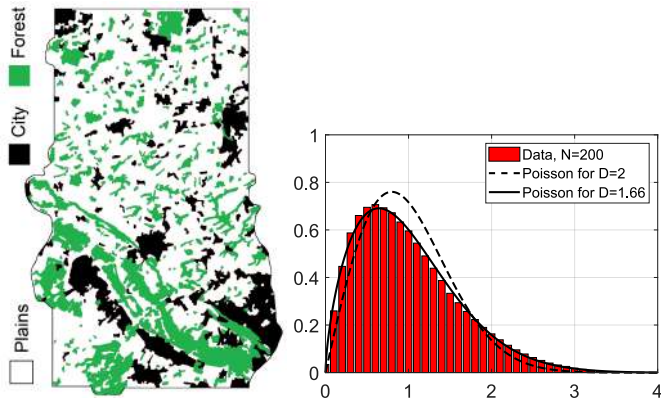

# Repulsion between different species: all y average

- repulsion with Eagle Owls (F): 174 spacings  $\beta = 0.1 - 0.15$
- repulsion with Eagle Owls (P): 40 spacings  $\beta = 0 - 0.1$
- repulsion Goshawk to Buzzard: 423 spacings " $\beta < 0$ "

# Influence of forested terrain

- **fit dimension  $D$**  of Poisson process on forested area

$$P_D(S) = a_D S^{D-1} e^{-b_D S^D}$$

- uncorrelated points in forest "to the left" of Poisson in 2D

## IV) Discussion

- ▶ fit of spacing between nests from 2D Coulomb gas
- ▶  $\beta$  NOT a biological parameter, allows to
  - quantify relative repulsion within / between species
  - assess time / population dependence
  - range of interaction (qualitative):  
 $\beta_{NN} > (<) \beta_{NNN}$  weaker (stronger) than 2D Coulomb
- ▶ influence of terrain: Poisson at  $D_{\text{eff}} \approx 1.66$ 
  - other interaction (Yukawa), independence of points, spacing ratios
  - find model from biology  $\approx$  2D Coulomb???
  - development in next 10 y?

# Bon Anniversaire Philippe !
