Accurate predictions are needed to support the analysis of experiments and for reactions not accessible experimentally

Accurate predictions are needed to support the analysis of experiments and for reactions not accessible experimentally

Three main challenges in any models

To make accurate predictions :

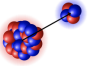

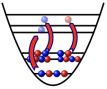

- 1) Choose dofs & use an accurate model
- 2) Interactions grounded in the underlying theory
- 3) Have an estimate of model & input uncertainties

Ideally, we want to describe all reactions from nucleon's degrees of freedom, with interactions derived from QCD

1) No core shell model with continuum

[Phys. Scr. **91**, 053002 (2016)]

(cf Dean's talk for NLEFT)

$$\Psi = \sum_{\lambda} c_{\lambda} \left| \begin{array}{c} \text{Discrete structure} \\ \text{information input} \end{array} \right\rangle + \sum_{\nu} \int dr u_{\nu}(r) \left| \begin{array}{c} \text{Continuous dynamical} \\ \text{input (clustering/reactions)} \end{array} \right\rangle$$

Ideally, we want to describe all reactions from nucleon's degrees of freedom, with interactions derived from QCD

1) No core shell model with continuum (cf Dean's talk for NLEFT)

[Phys. Scr. **91**, 053002 (2016)]

$$\Psi = \sum_{\lambda} c_{\lambda} \left| \begin{array}{c} \text{Discrete structure} \\ \text{information input} \end{array} \right\rangle + \sum_{\nu} \int dr u_{\nu}(r) \left| \begin{array}{c} \text{Continuous dynamical} \\ \text{input (clustering/reactions)} \end{array} \right\rangle$$

2) Use of chiral-EFT interactions

Ideally, we want to describe all reactions from nucleon's degrees of freedom, with interactions derived from QCD

1) No core shell model with continuum (cf Dean's talk for NLEFT)

[Phys. Scr. **91**, 053002 (2016)]

$$\Psi = \sum_{\lambda} c_{\lambda} \left| \begin{array}{c} \text{Discrete structure} \\ \text{information input} \end{array} \right\rangle + \sum_{\nu} \int dr u_{\nu}(r) \left| \begin{array}{c} \text{Continuous dynamical} \\ \text{input (clustering/reactions)} \end{array} \right\rangle$$

2) Use of chiral-EFT interactions

3) Vary the interactions and truncation of model spaces

Recent predictions constrain astrophysical reactions relevant for the BBN & the p - p chain

$$\alpha(d, \gamma)^6\text{Li}$$

[Hebborn *et al.* PRL 129 042503 (2022)]

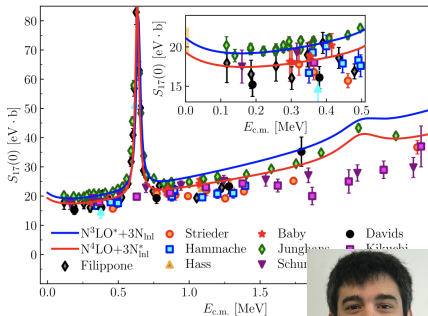

Recent predictions constrain astrophysical reactions relevant for the BBN & the p - p chain

$$\alpha(d, \gamma)^6\text{Li}$$

[Hebborn *et al.* PRL 129 042503 (2022)]

$${}^7\text{Be}(p, \gamma){}^8\text{B}$$

[Kravvaris *et al.* PLB 845 138156 (2023)]

For reactions involving heavier nuclei, one needs to make approximations

light nuclei & low E

heavier nuclei & higher E

For reactions involving heavier nuclei, one needs to make approximations

→ Going in the right direction, but not satisfactory... so what's next?

Going beyond the core-spectator approximation with the Green's function knockout formalism

Goal : include dissipative processes due to the hole propagation in the many-body systems with dispersive potentials

→ structure & reaction treated consistently

[PRC 107 014607 (2023)]

ongoing... with Potel, Pruitt & Escher at LLNL

For reactions involving heavier nuclei, one needs to make approximations

light nuclei & low E

heavier nuclei & higher E

To make accurate reaction predictions :

- 1) Choose dofs & use an accurate model
- 2) **Interactions grounded in the underlying theory**
- 3) Have an estimate of model & input uncertainties

Combining EFTs, *ab initio* predictions and few-body models lead to accurate knockout cross sections

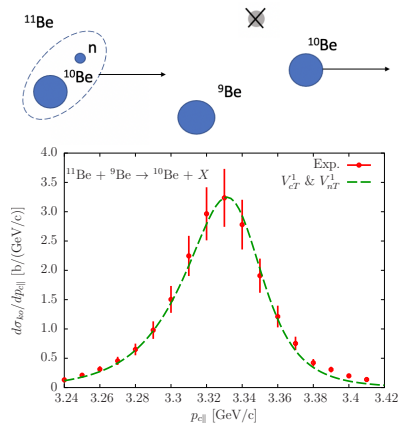

Halo-EFT of ^{11}Be using NCSMC prediction for ANC [PRL 117, 242501 (2017)]

[Exp. : Aumann *et al.* PRL 84, 35 (2000)] [Th. : Hebborn and Capel, PRC 104, 024616 (2021); PRC 100, 054607 (2019)]

Combining EFTs, *ab initio* predictions and few-body models lead to accurate knockout cross sections

Halo-EFT of ^{11}Be using NCSMC prediction for ANC [PRL 117, 242501 (2017)]

Similar plan for Coulomb breakup of ^{37}Mg (PAC2)

see Aldric's talk

[Exp. : Aumann *et al.* PRL 84, 35 (2000)] [Th. : Hebborn and Capel, PRC 104, 024616 (2021); PRC 100, 054607 (2019)]

Similar idea can be used to interpret reactions (${}^6\text{Li}, d$) data extracting ANCs used to constrain astrophysical rates

${}^{12}\text{C}({}^6\text{Li}, d){}^{16}\text{O}$

[Avila *et al.* PRL **114**, 071101 (2015)]

Similar idea can be used to interpret reactions (${}^6\text{Li}, d$) data extracting ANCs used to constrain astrophysical rates

${}^{12}\text{C}({}^6\text{Li}, d){}^{16}\text{O}$

[Avila *et al.* PRL **114**, 071101 (2015)]

Ab initio ($C_{\alpha-d}$)² → 21% reduction of the S-factor at stellar energies!

[Hebborn, Avila, Kravvaris, Potel & Quaglioni arXiv :2307.05636]

To reach a more unified treatment of structure & reactions,
recent efforts to derive microscopic optical potentials

Shell model optical potentials

- 2) Interactions grounded in the underlying theory
- 3) **Have an estimate of model & input uncertainties**

Impressive recent effort to quantify uncertainties for global parametrization of optical potential at LLNL

Global fit using Bayesian statistics by Cole Pruitt

[Pruitt *et al.* PRC 107, 014602 (2023) including python scripts!]

Using *consistent* s - p description, we quantify the uncertainties due to optical potentials in knockout & (p, d) reactions

No discrepancy for $\Delta S \ll 0$ and likely model deficiencies for $\Delta S \gg 0$!

[C. Hebborn, F. Nunes, A. E. Lovell, PRL 131, 212503 (2023)]

possible follow up with O. Sorlin *et al.*

At MSU, large effort pushing for a systematic quantification of uncertainties

Emulator for reaction study

[Drischler *et al.* PLB, 13677 (2021)]

<https://github.com/bandframework/rose/>

Complete quantification of uncertainties

& exploring exp. conditions to reduce them

[PRC 108 024601 (2023); PRC 100 064615 (2019)]

Propagating KDUQ into charge exchange
(in prep. with Remco and Filomena)

(p,n)⁴⁸Ca, by A. Smith
(PhD student at MSU)

M. Catacora Rios
(PhD student at MSU)

Pablo & Filomena

+ many other efforts not listed

There are still challenges to improve our description of reactions

light nuclei & low E

heavier nuclei & higher E

To make accurate reaction predictions :

- 1) Choose dofs & use an accurate model
Interest in improving eikonal description
& moving to 4-body reactions
- 2) Interactions grounded in the underlying theory
Halo-EFT & microscopic optical potentials
- 3) Have an estimate of model & input uncertainties
Bayesian analysis of reactions
