

# FRB overview

Cherry Ng-Guihéneuf (LPC2E/CNRS) || Atelier FRB et Neutrinos @IAP (Nov 27-28, 2023)

- Intenses ( $< 10^{44}$  erg s $^{-1}$ )
- Extra-galactiques ( $\sim 0.03 > z > 1$ )
- Abondants ( $\sim 5,000$ /ciel/jour)

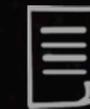

*Image adaptée par Nature Astronomy*

Utilisés comme sondes cosmologiques pour:

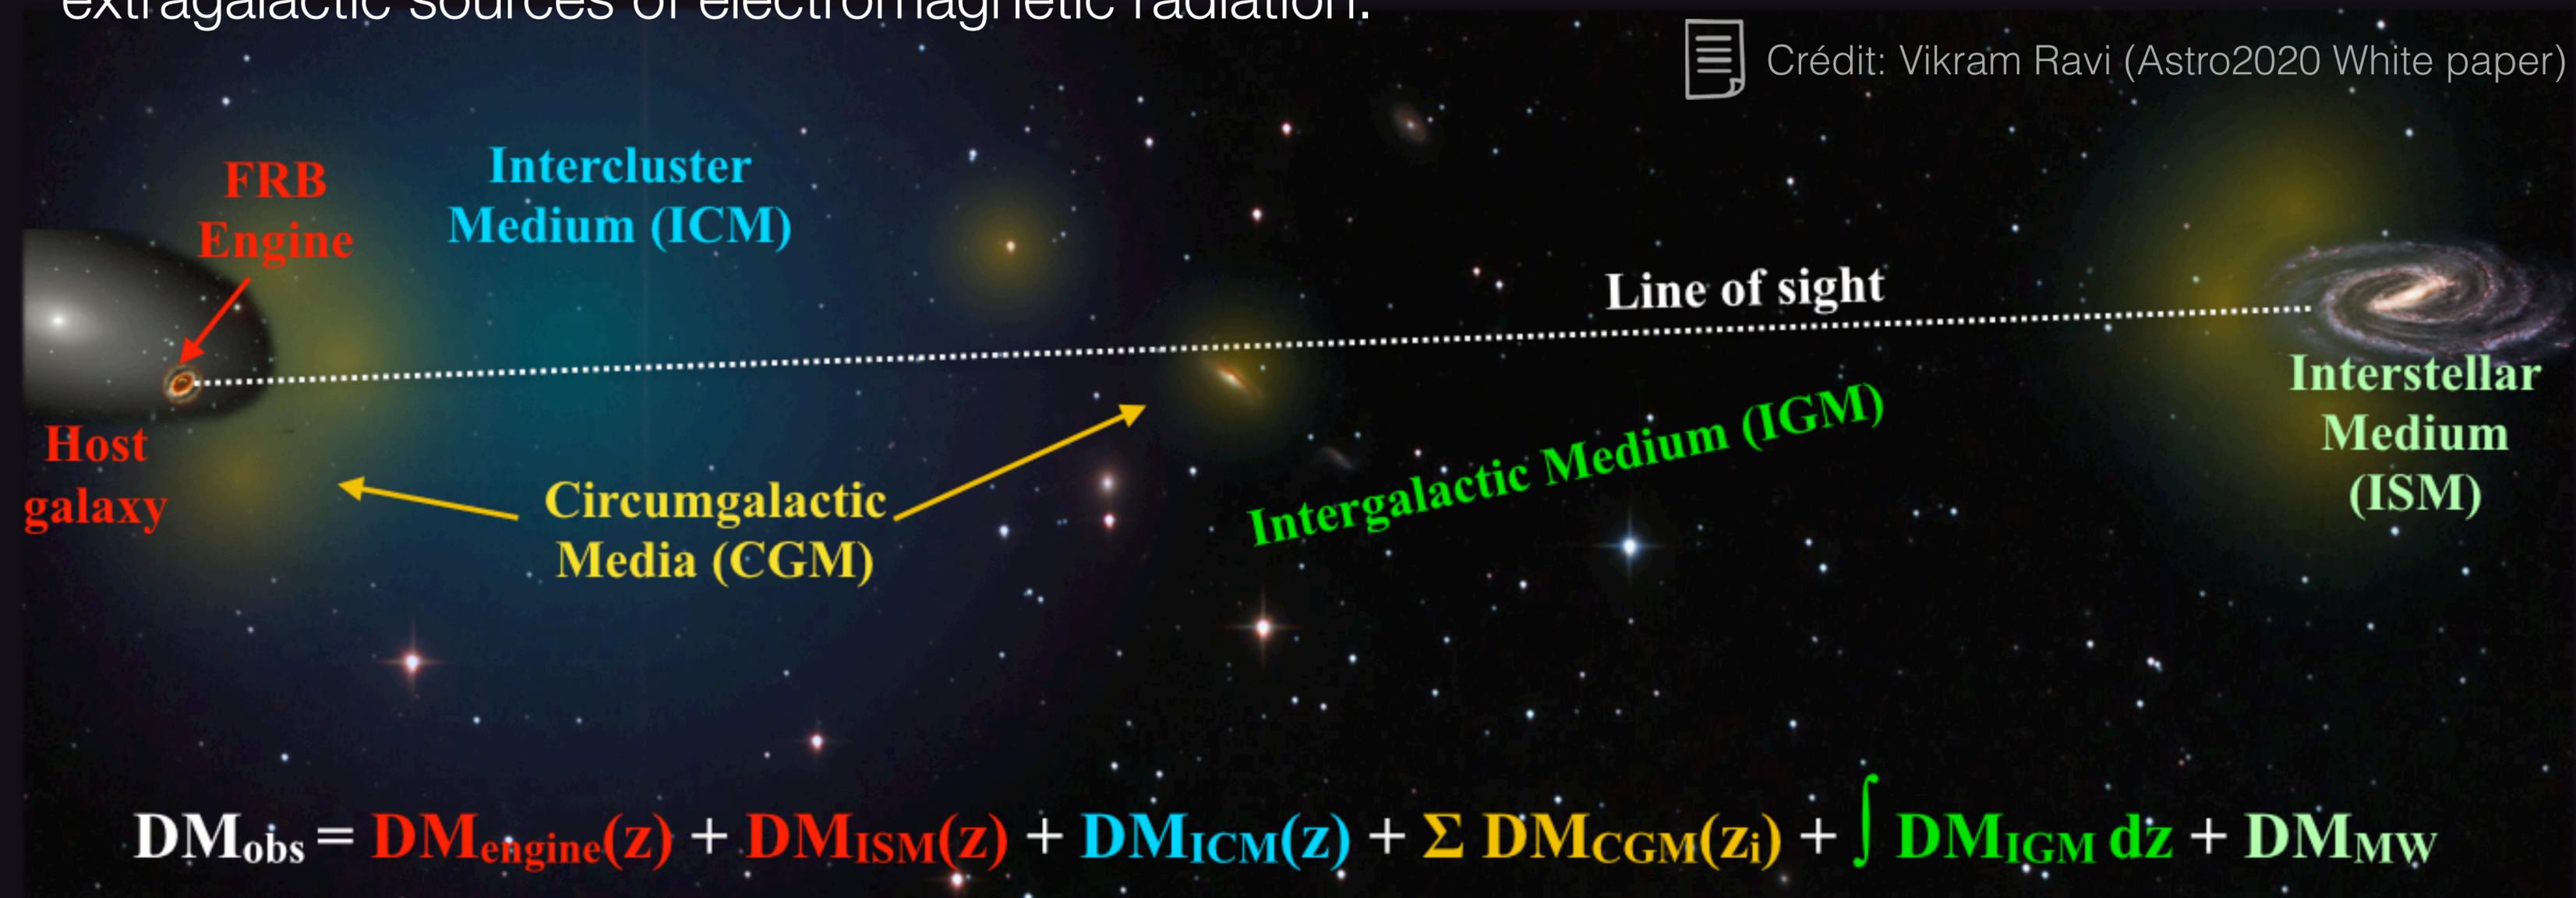

- le milieu intergalactique
- les baryons manquants

# FRB as a probe for the Universe

FRBs are the shortest-duration extragalactic transients, and the most compact known extragalactic sources of electromagnetic radiation.

Crédit: Vikram Ravi (Astro2020 White paper)

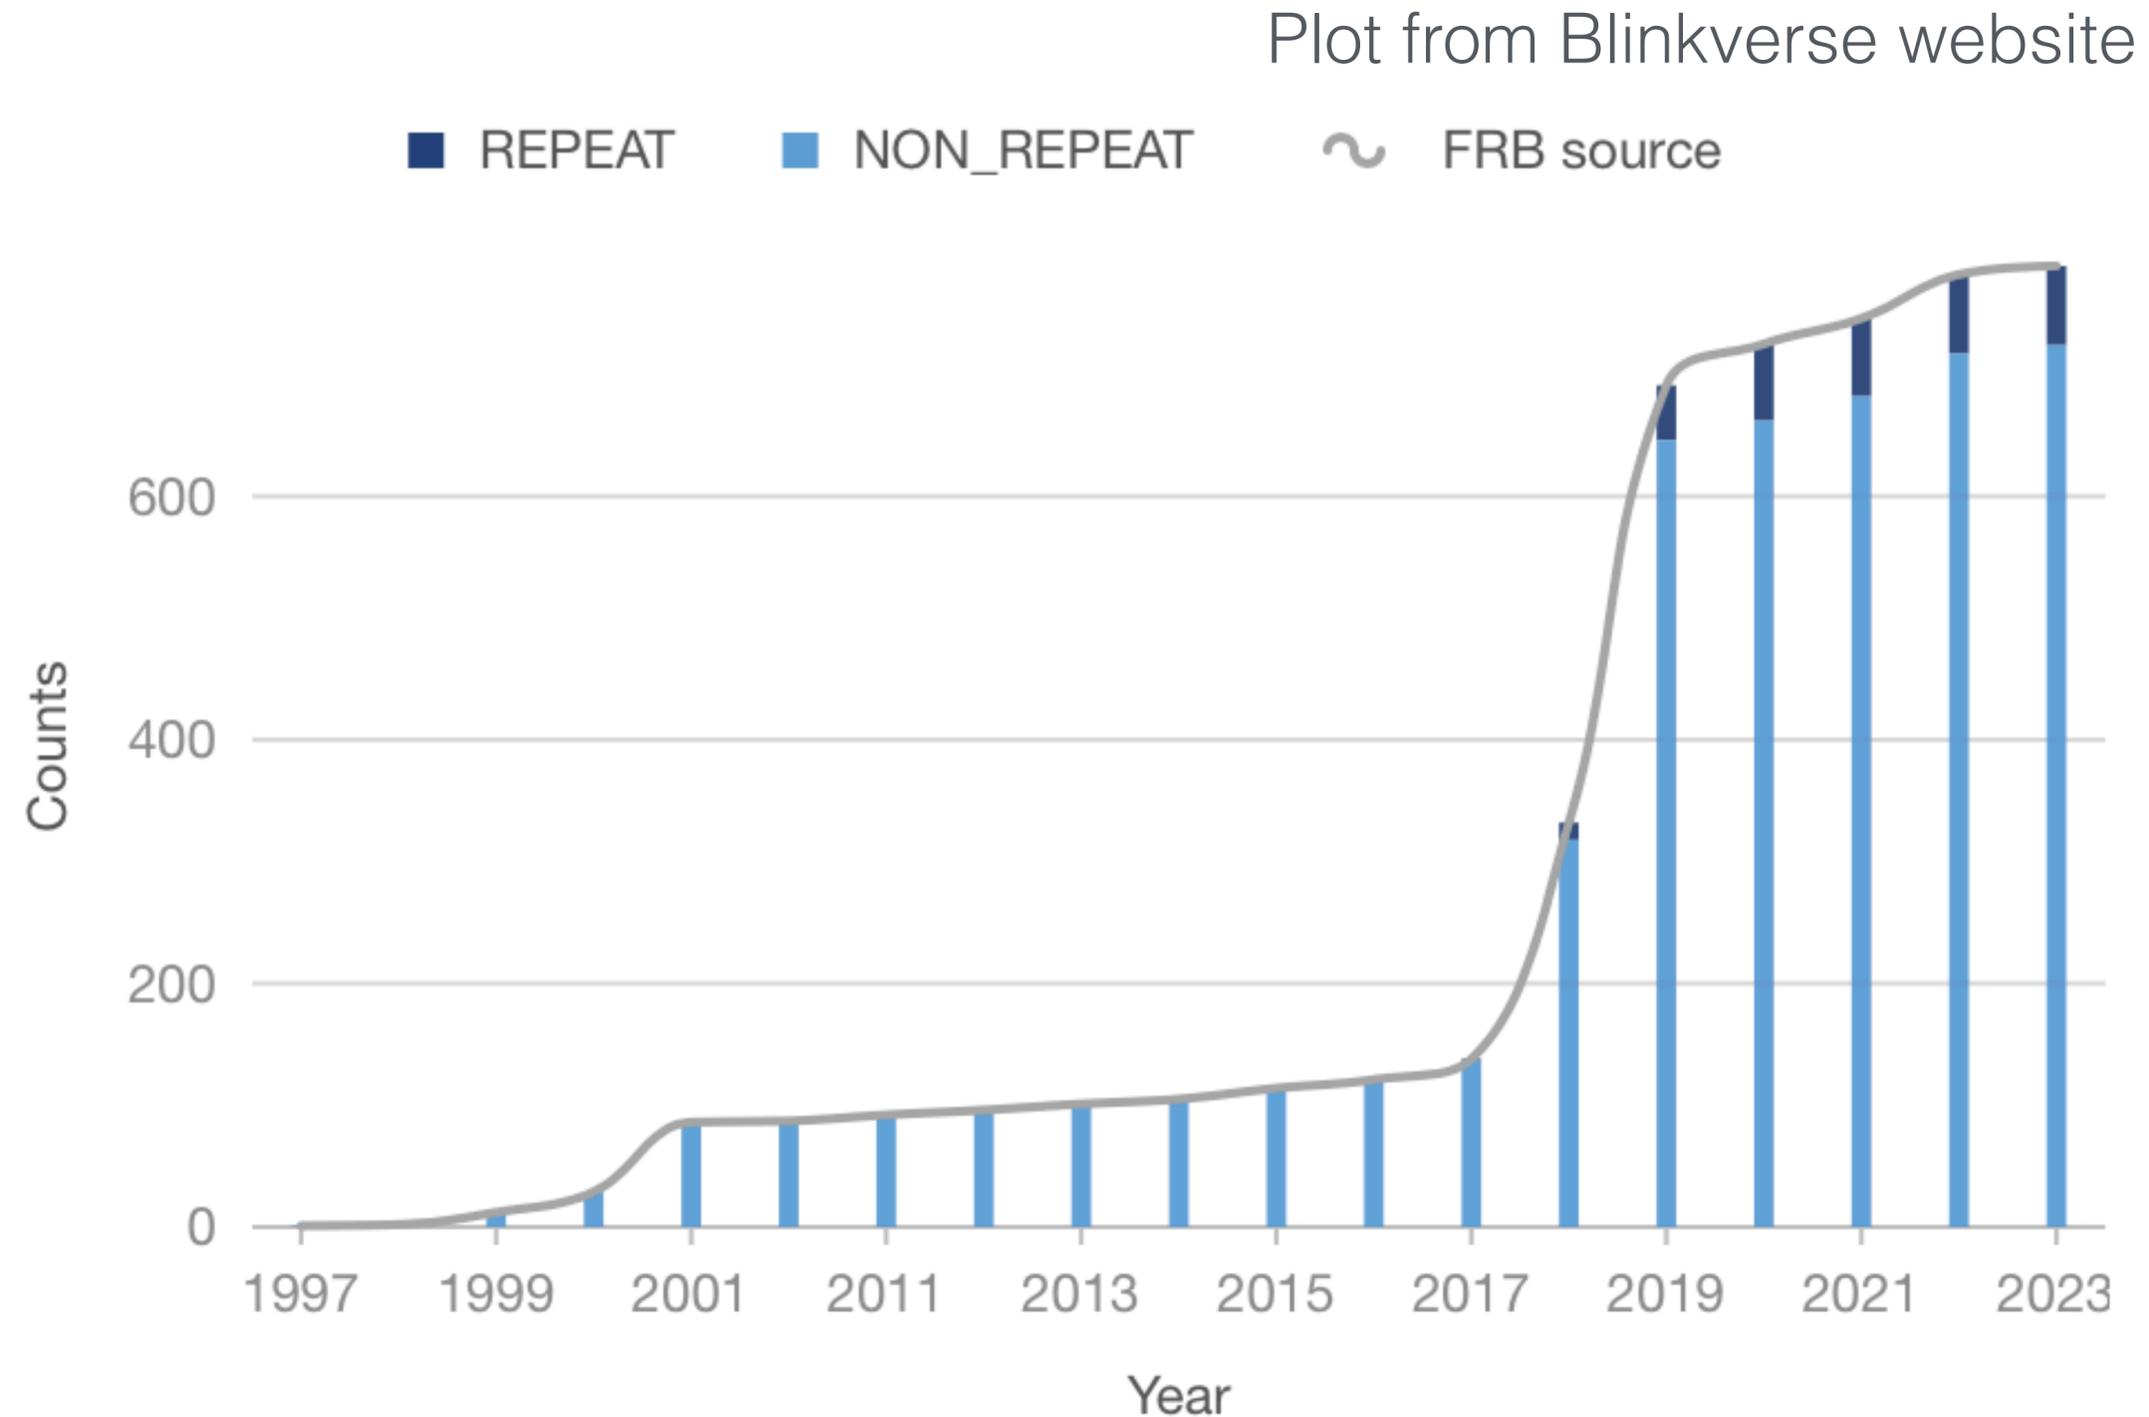

—> FRB provides a clean signal to study these otherwise very hard to probe components

# Observational parameters

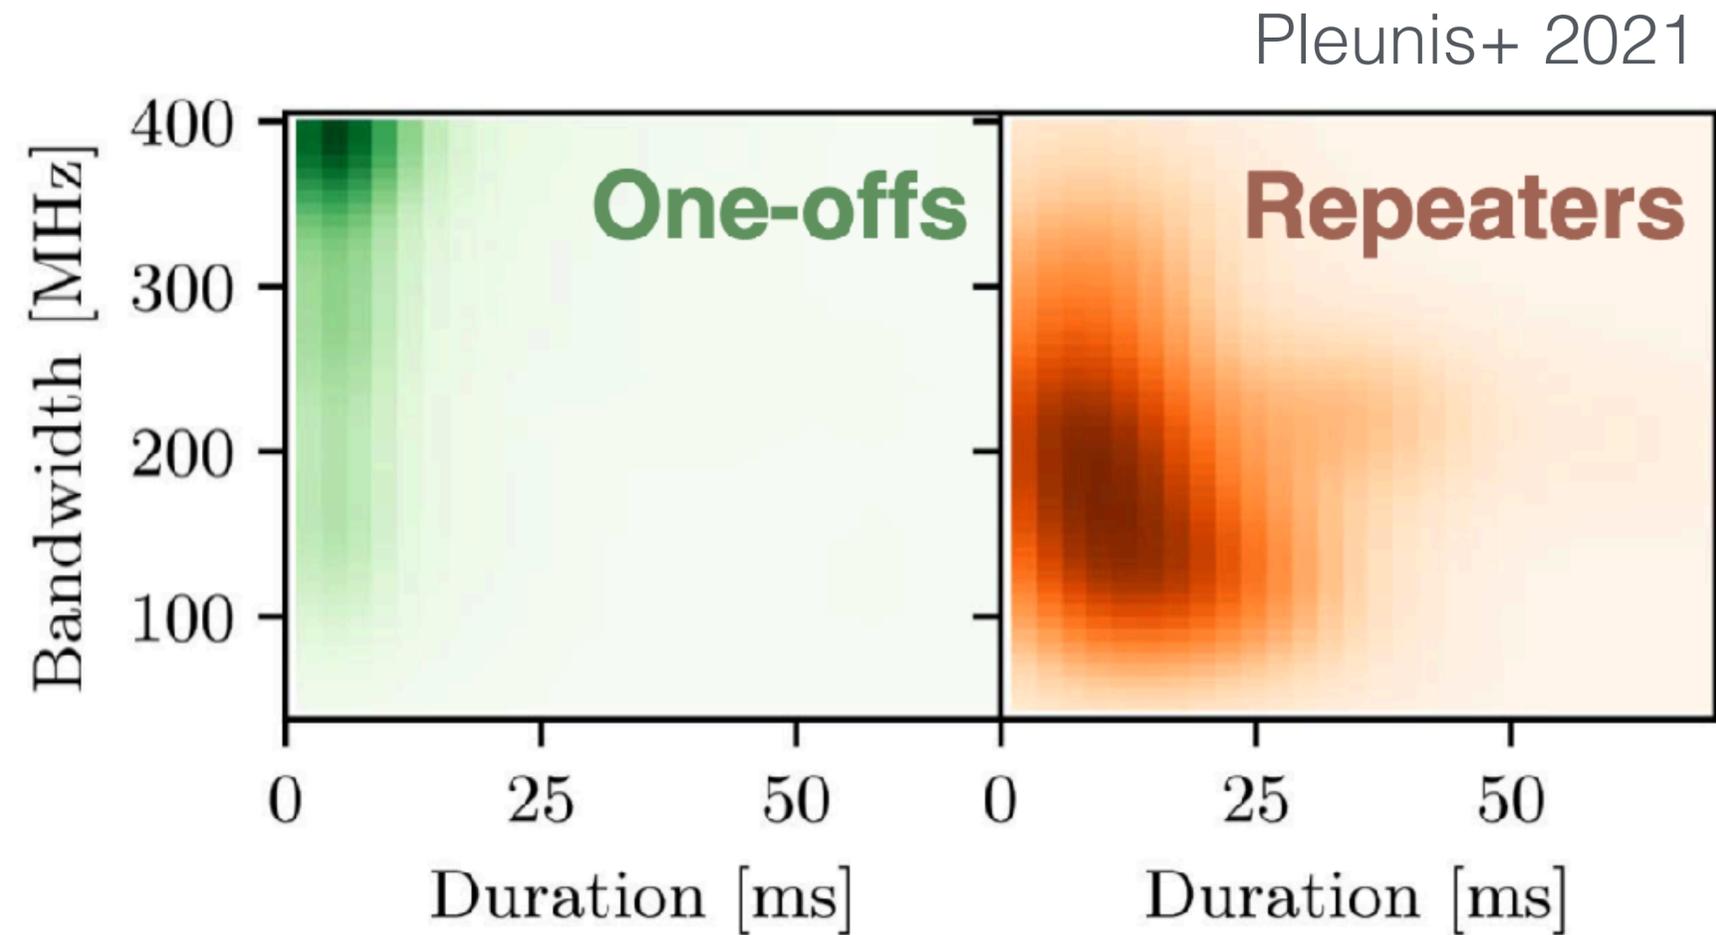

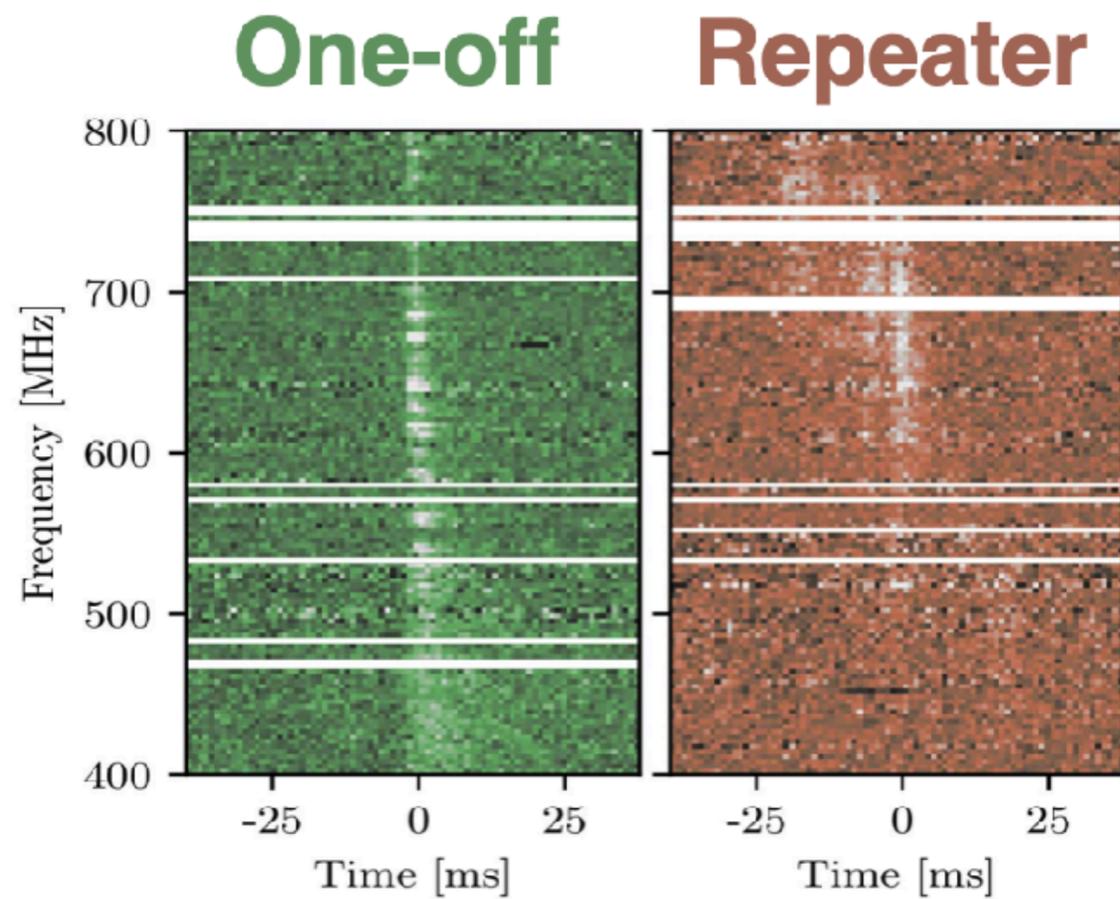

Repetition, periodicity, timescale, luminosity, emission  
frequency range, polarization

# Source count

- Published FRBs = 789
  - 724 non-repeaters
  - 65 repeaters (~8%)
- Plus over 4000 not-yet published

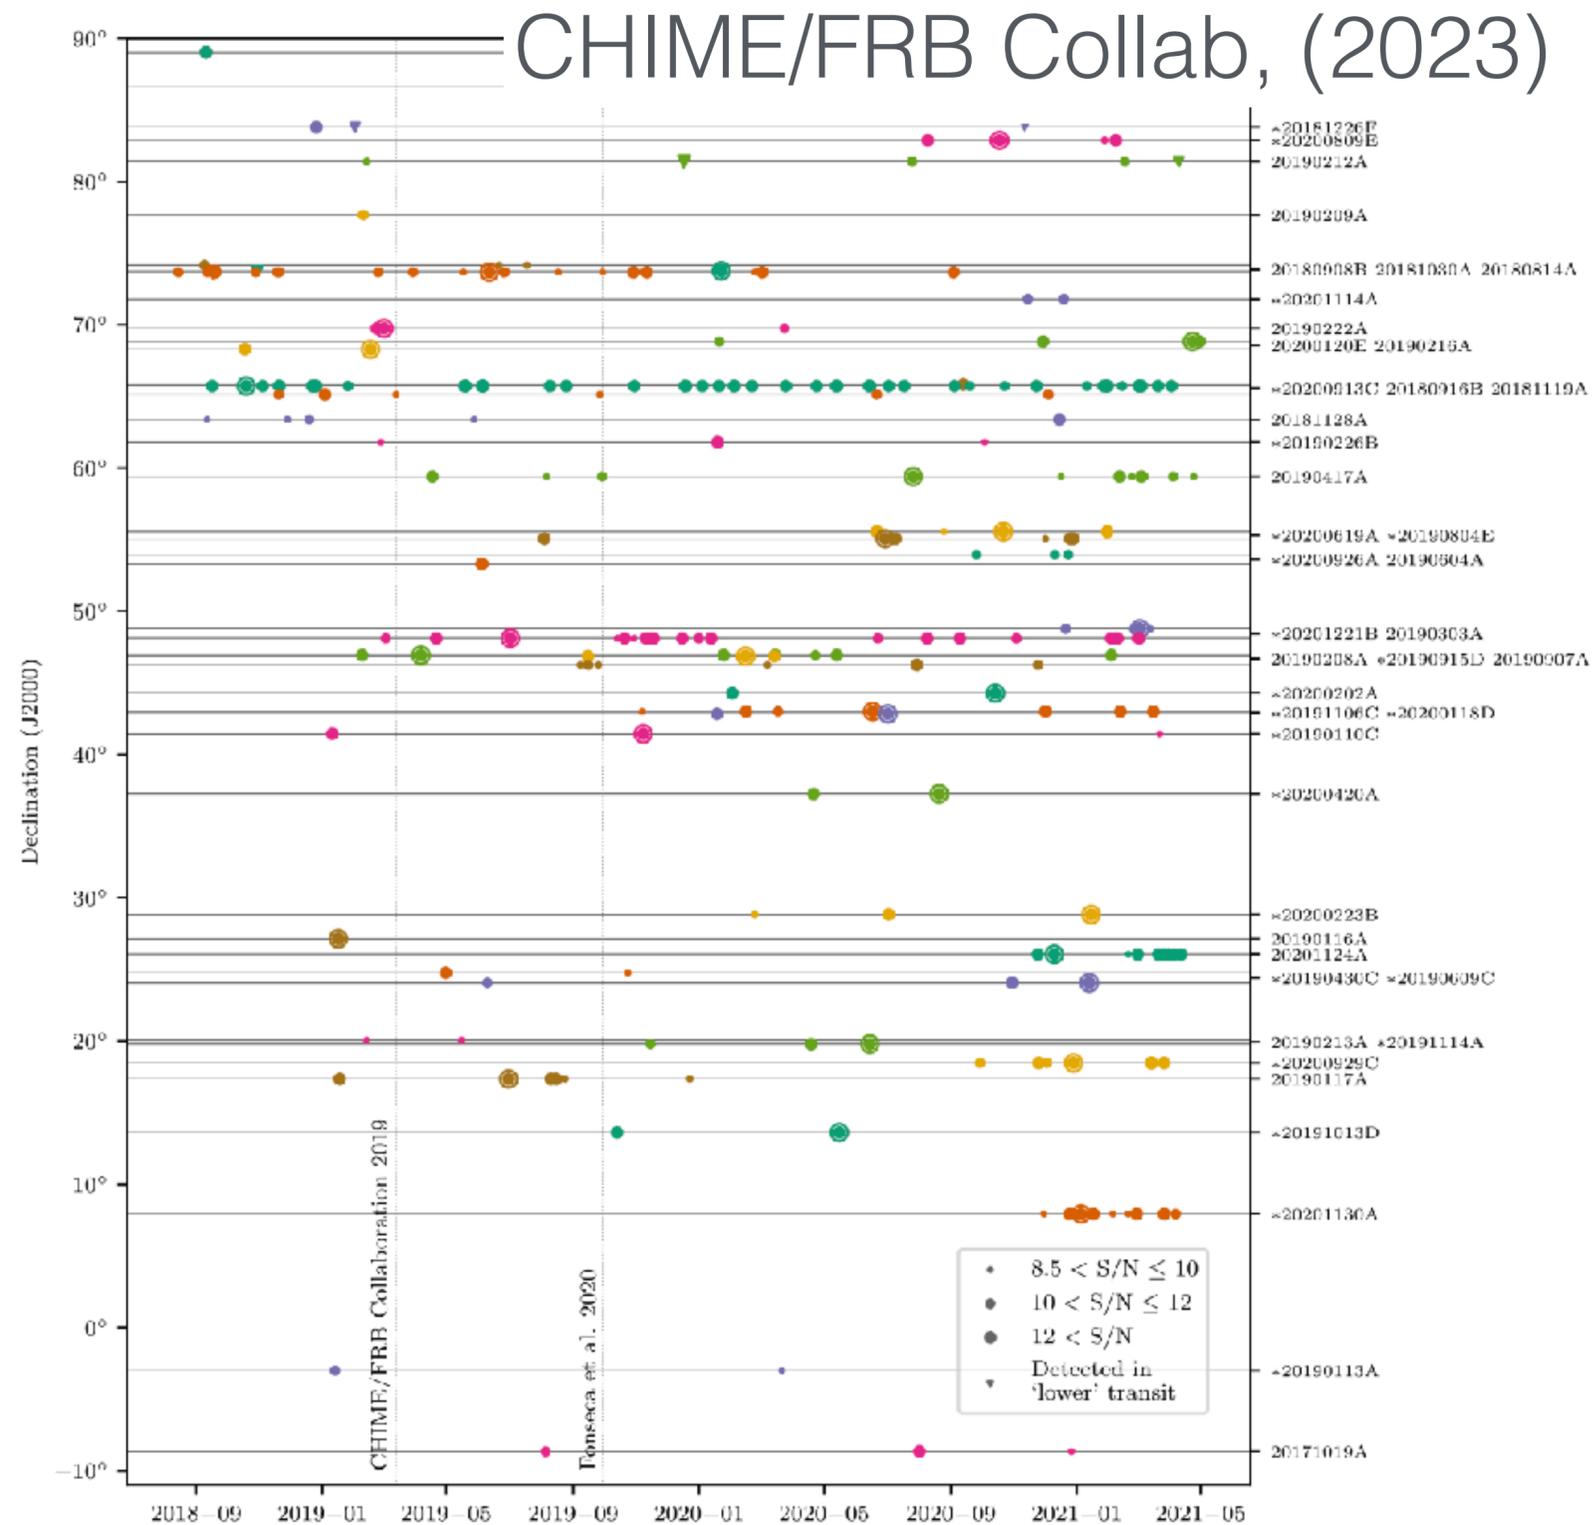

# Multiple population

- Repeaters tend to have wider burst width and a narrow emission band compared to one-off FRBs.

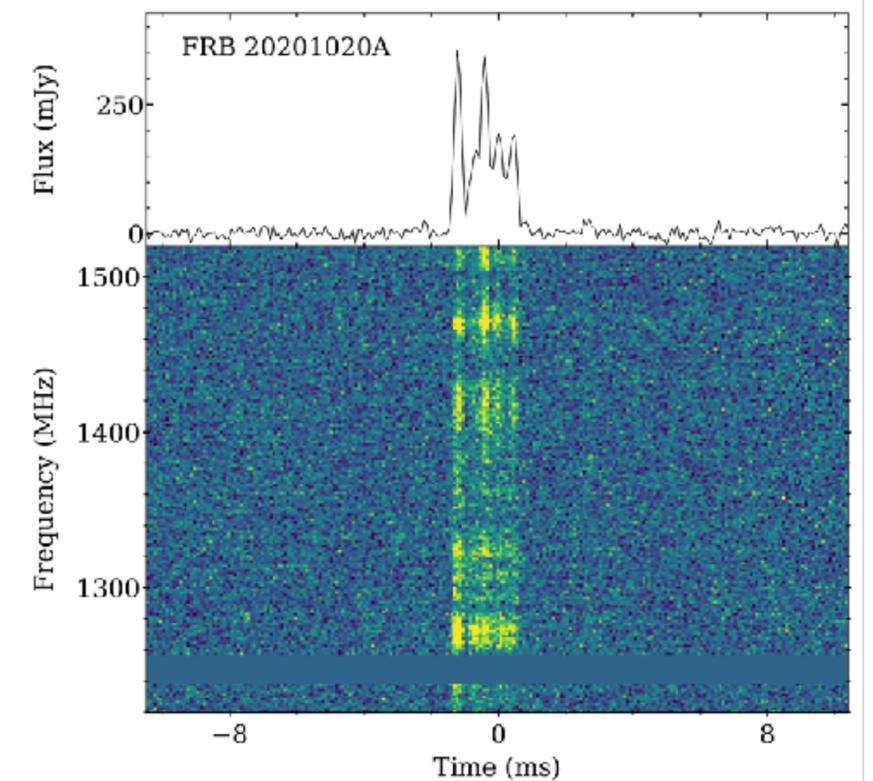

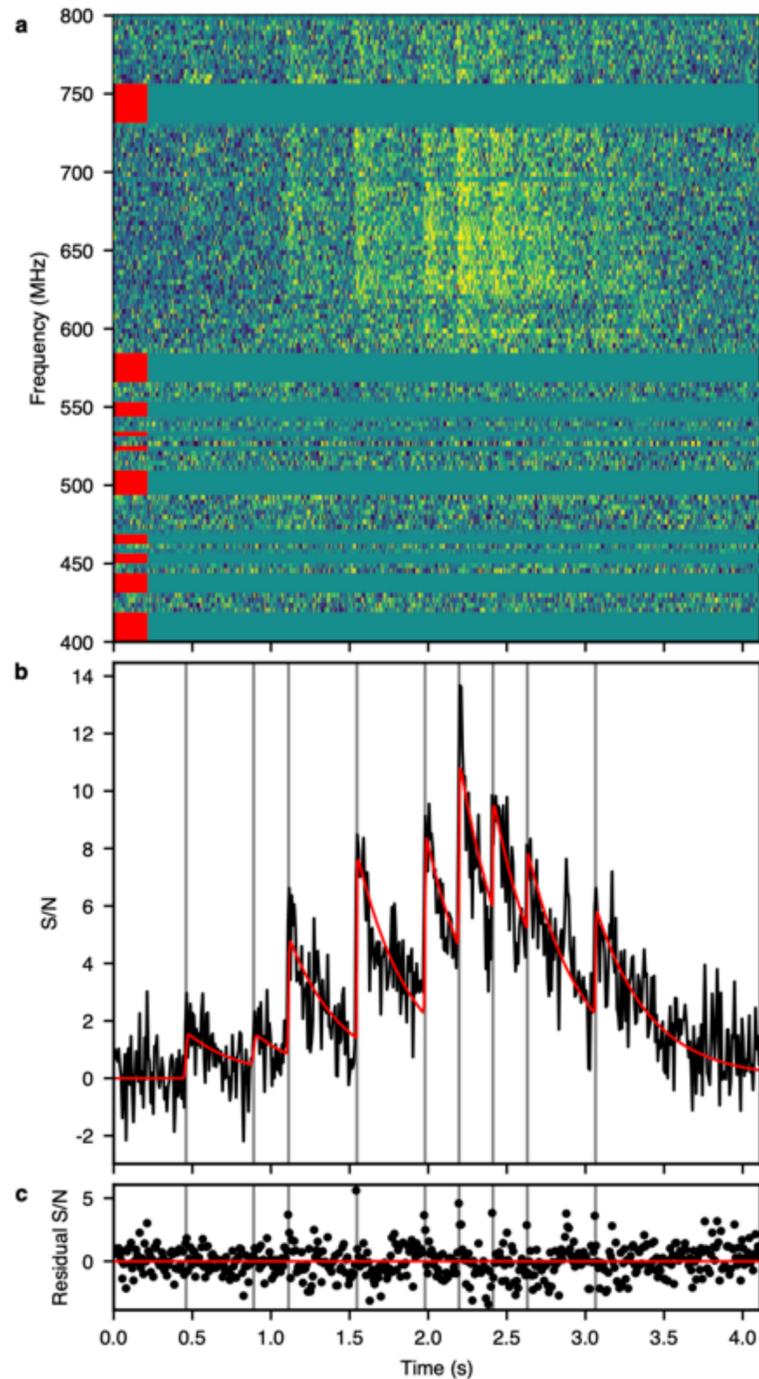

# Repeating FRBs

- CHIME repeater database: <https://www.chime-frb.ca/repeaters>
- Clustering in time and energy distribution
- Periodicity:
  - 16 days for FRB 20180916 (CHIME/FRB Collab, 2020, Pastor-Marazuela+, 2021)
  - ~160 days for FRB 20121102A (Rajwade+2020, Cruces+2020)
  - ~50 days for FRB 20190417A but disappearing (FAST team, in prep)

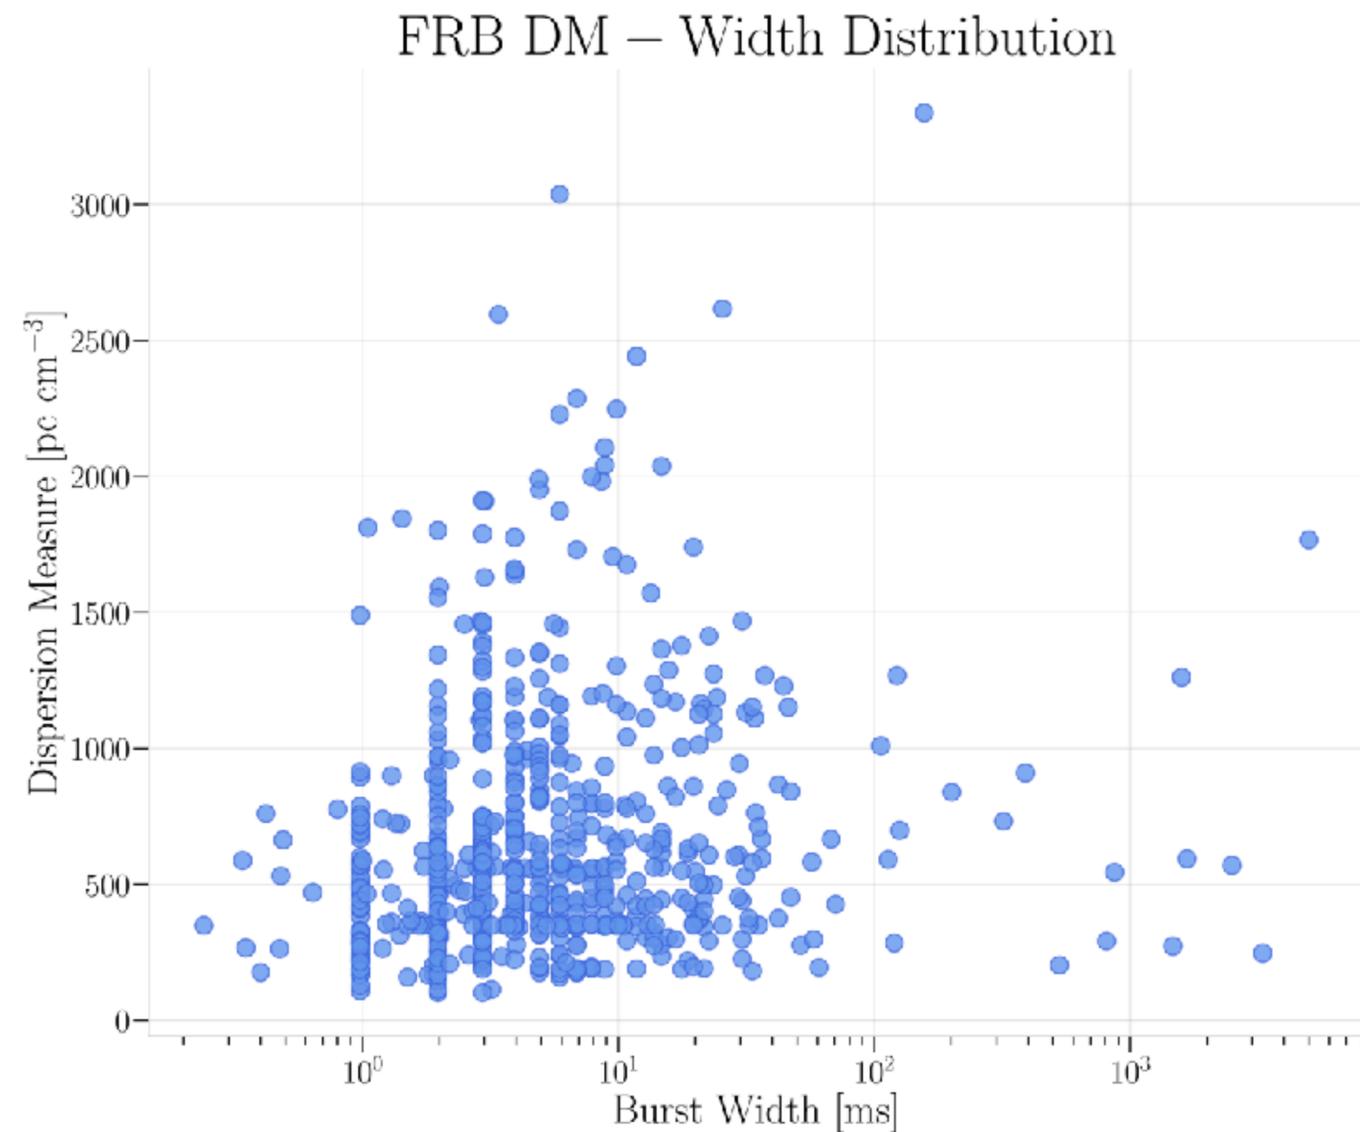

# Sub-second periodicity

- CHIME: FRB 20191221A with 216.8(1) ms periodicity in ~3 s long burst  
—> suggest NS magnetosphere?
- Apertif: FRB 20201020A with 0.411 ms periodicity
- ASKAP: 7.28ms (Dial+, in prep)

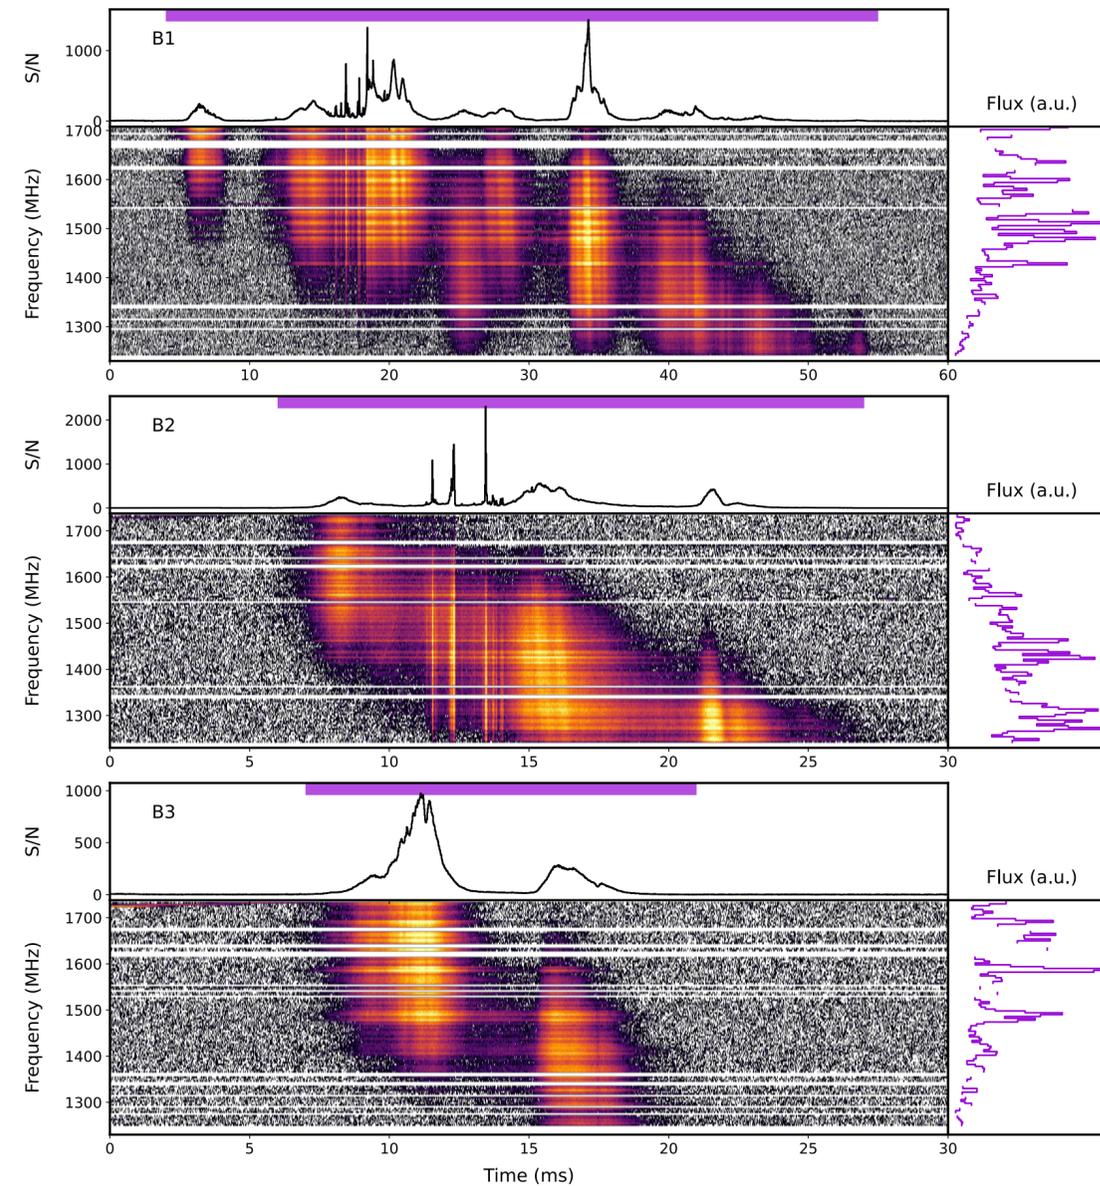

# Burst width range

Plot from frbstats website

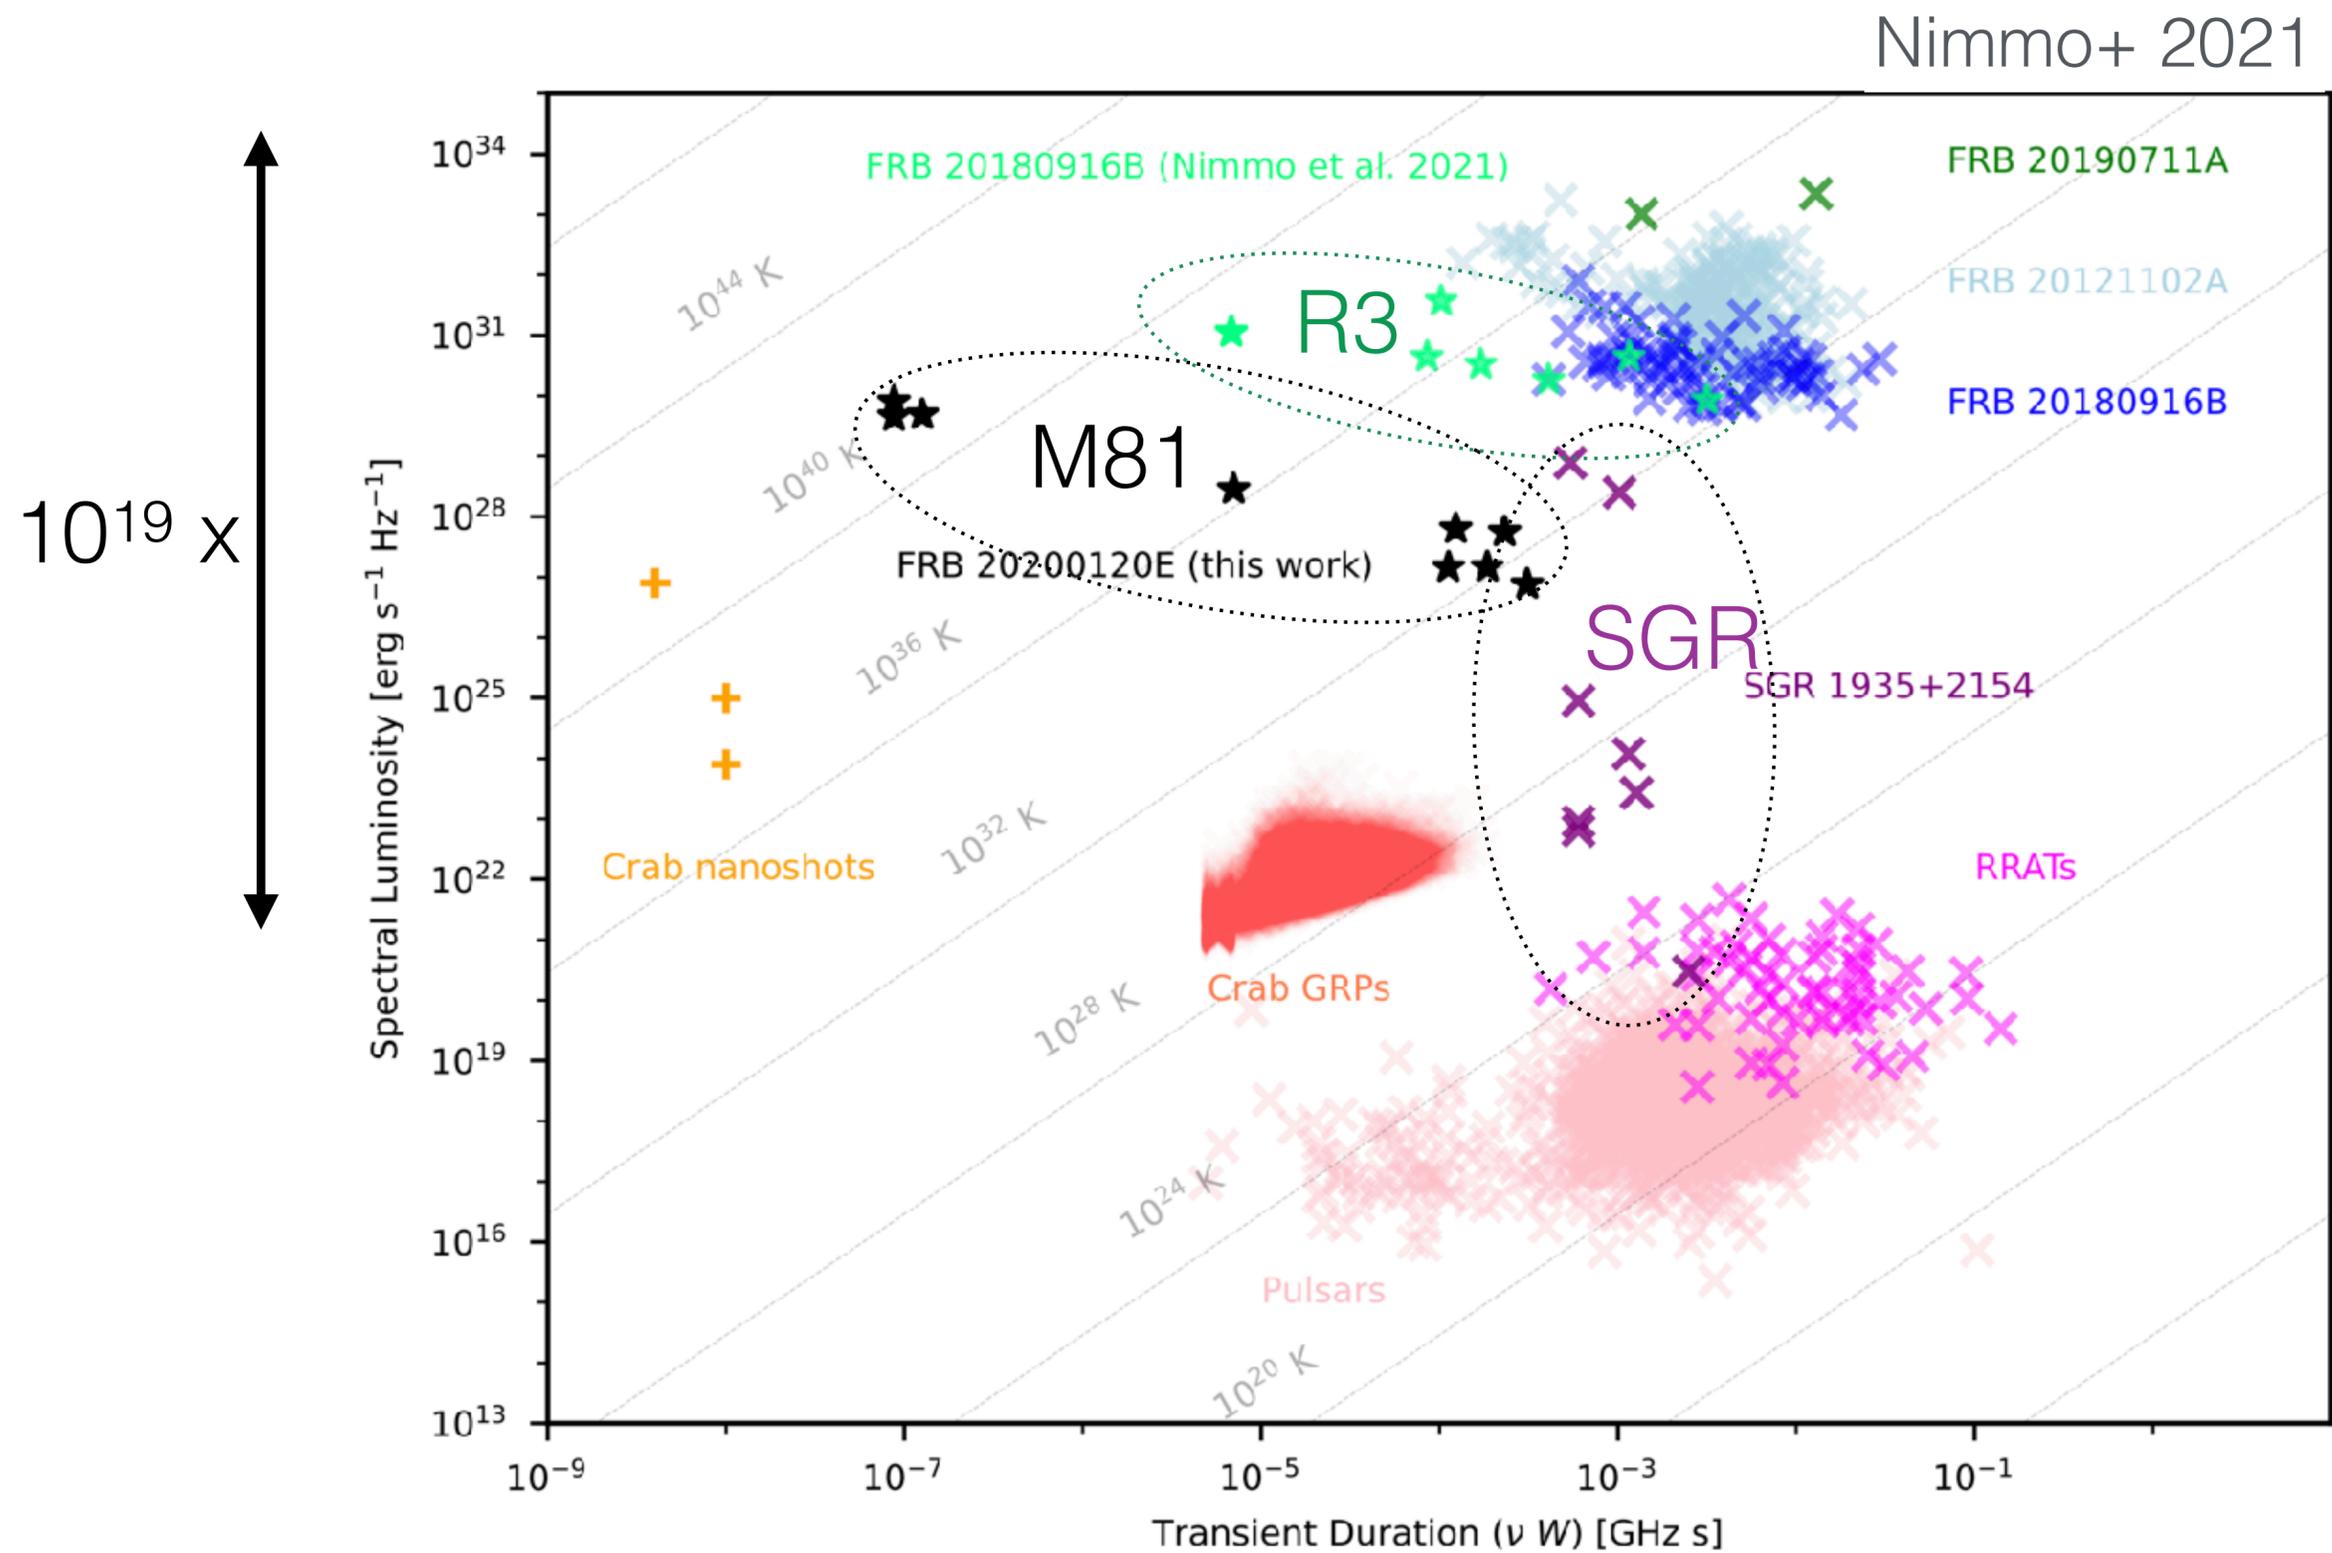

- Burst width range from sub-ms to few seconds

Hewitt+Cognard+  
2023

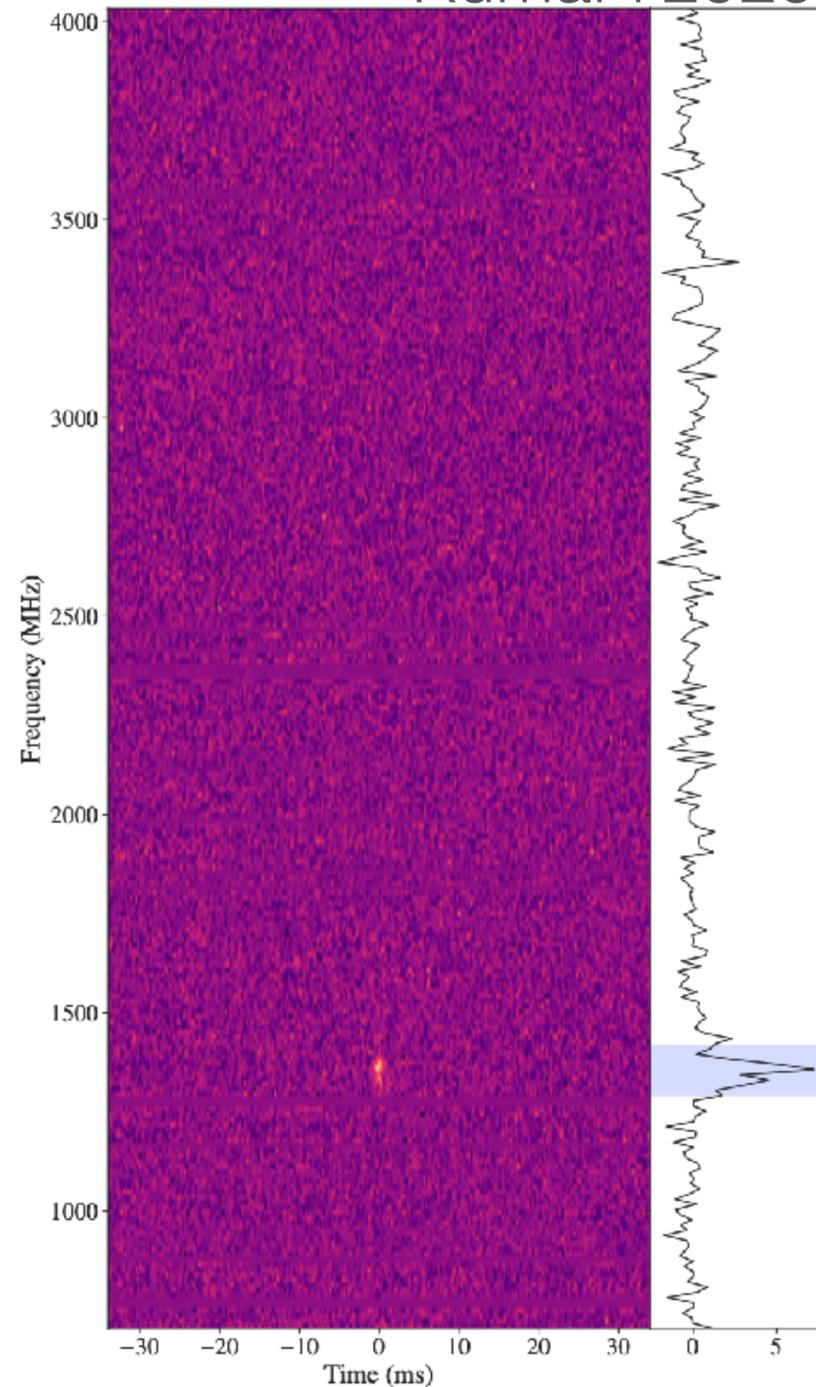

- Microshots of tens of  $\mu\text{s}$  seen in FRB 20220912A with the Nançay radio telescope, similar to solar flare?

# Spectral luminosity

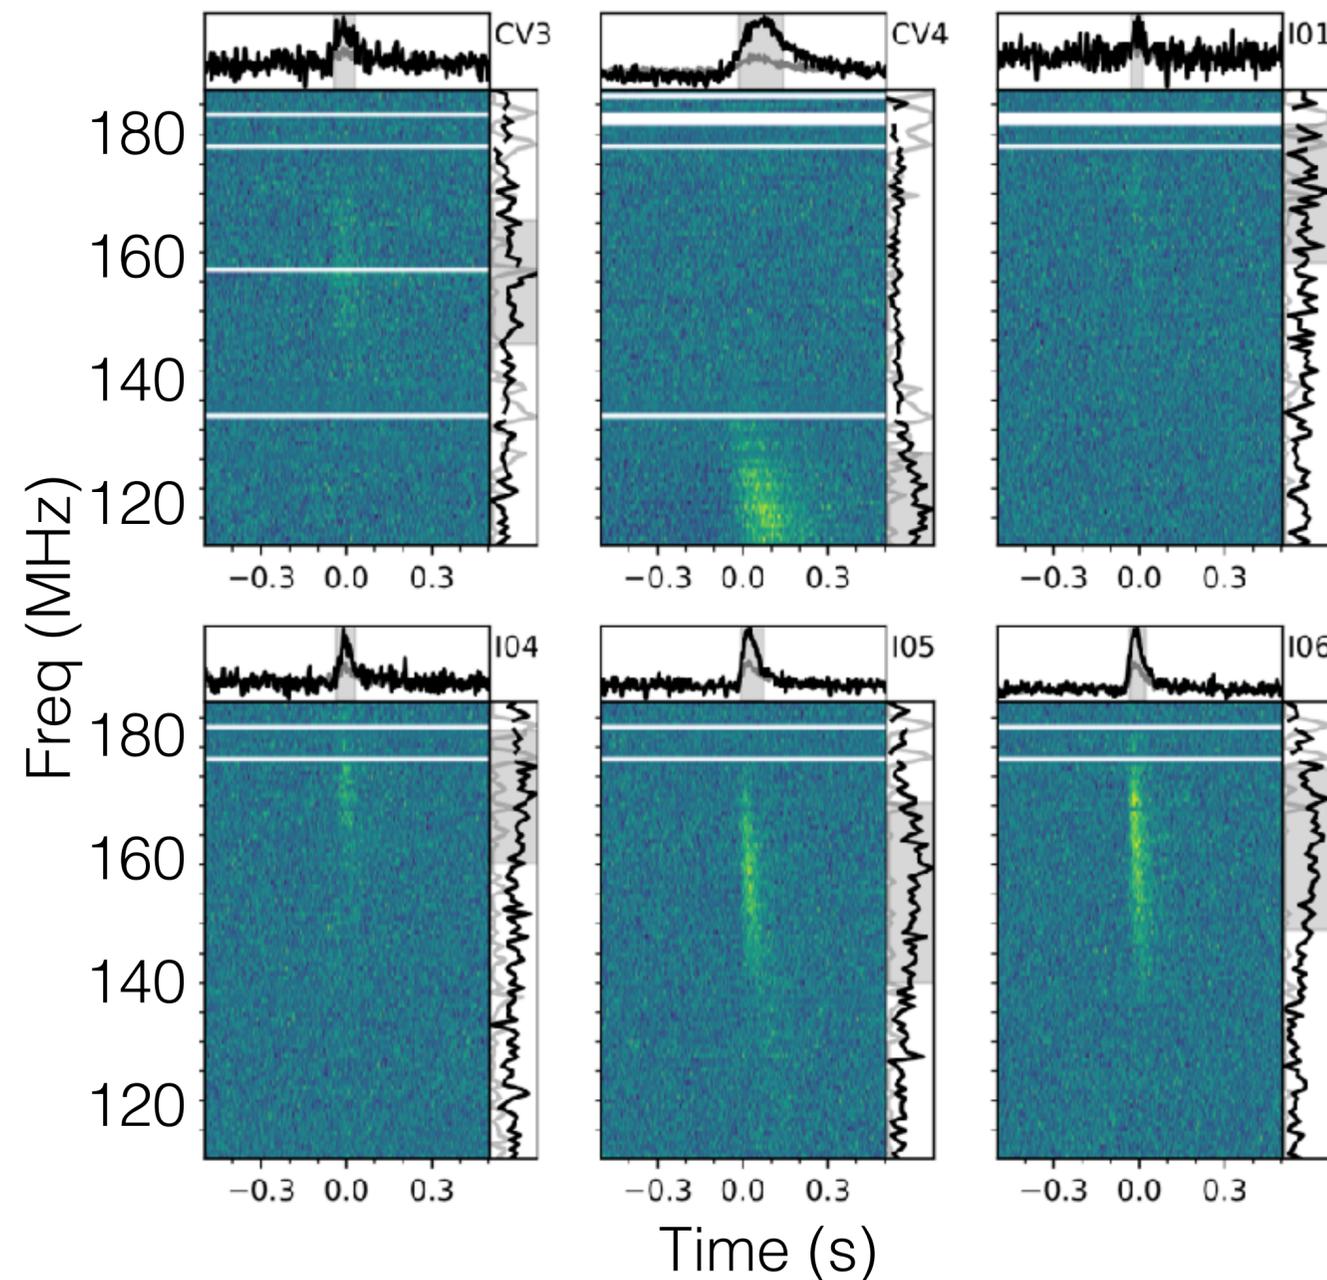

# Narrow band emission

Kumar+2020

Pleunis+ (2021)

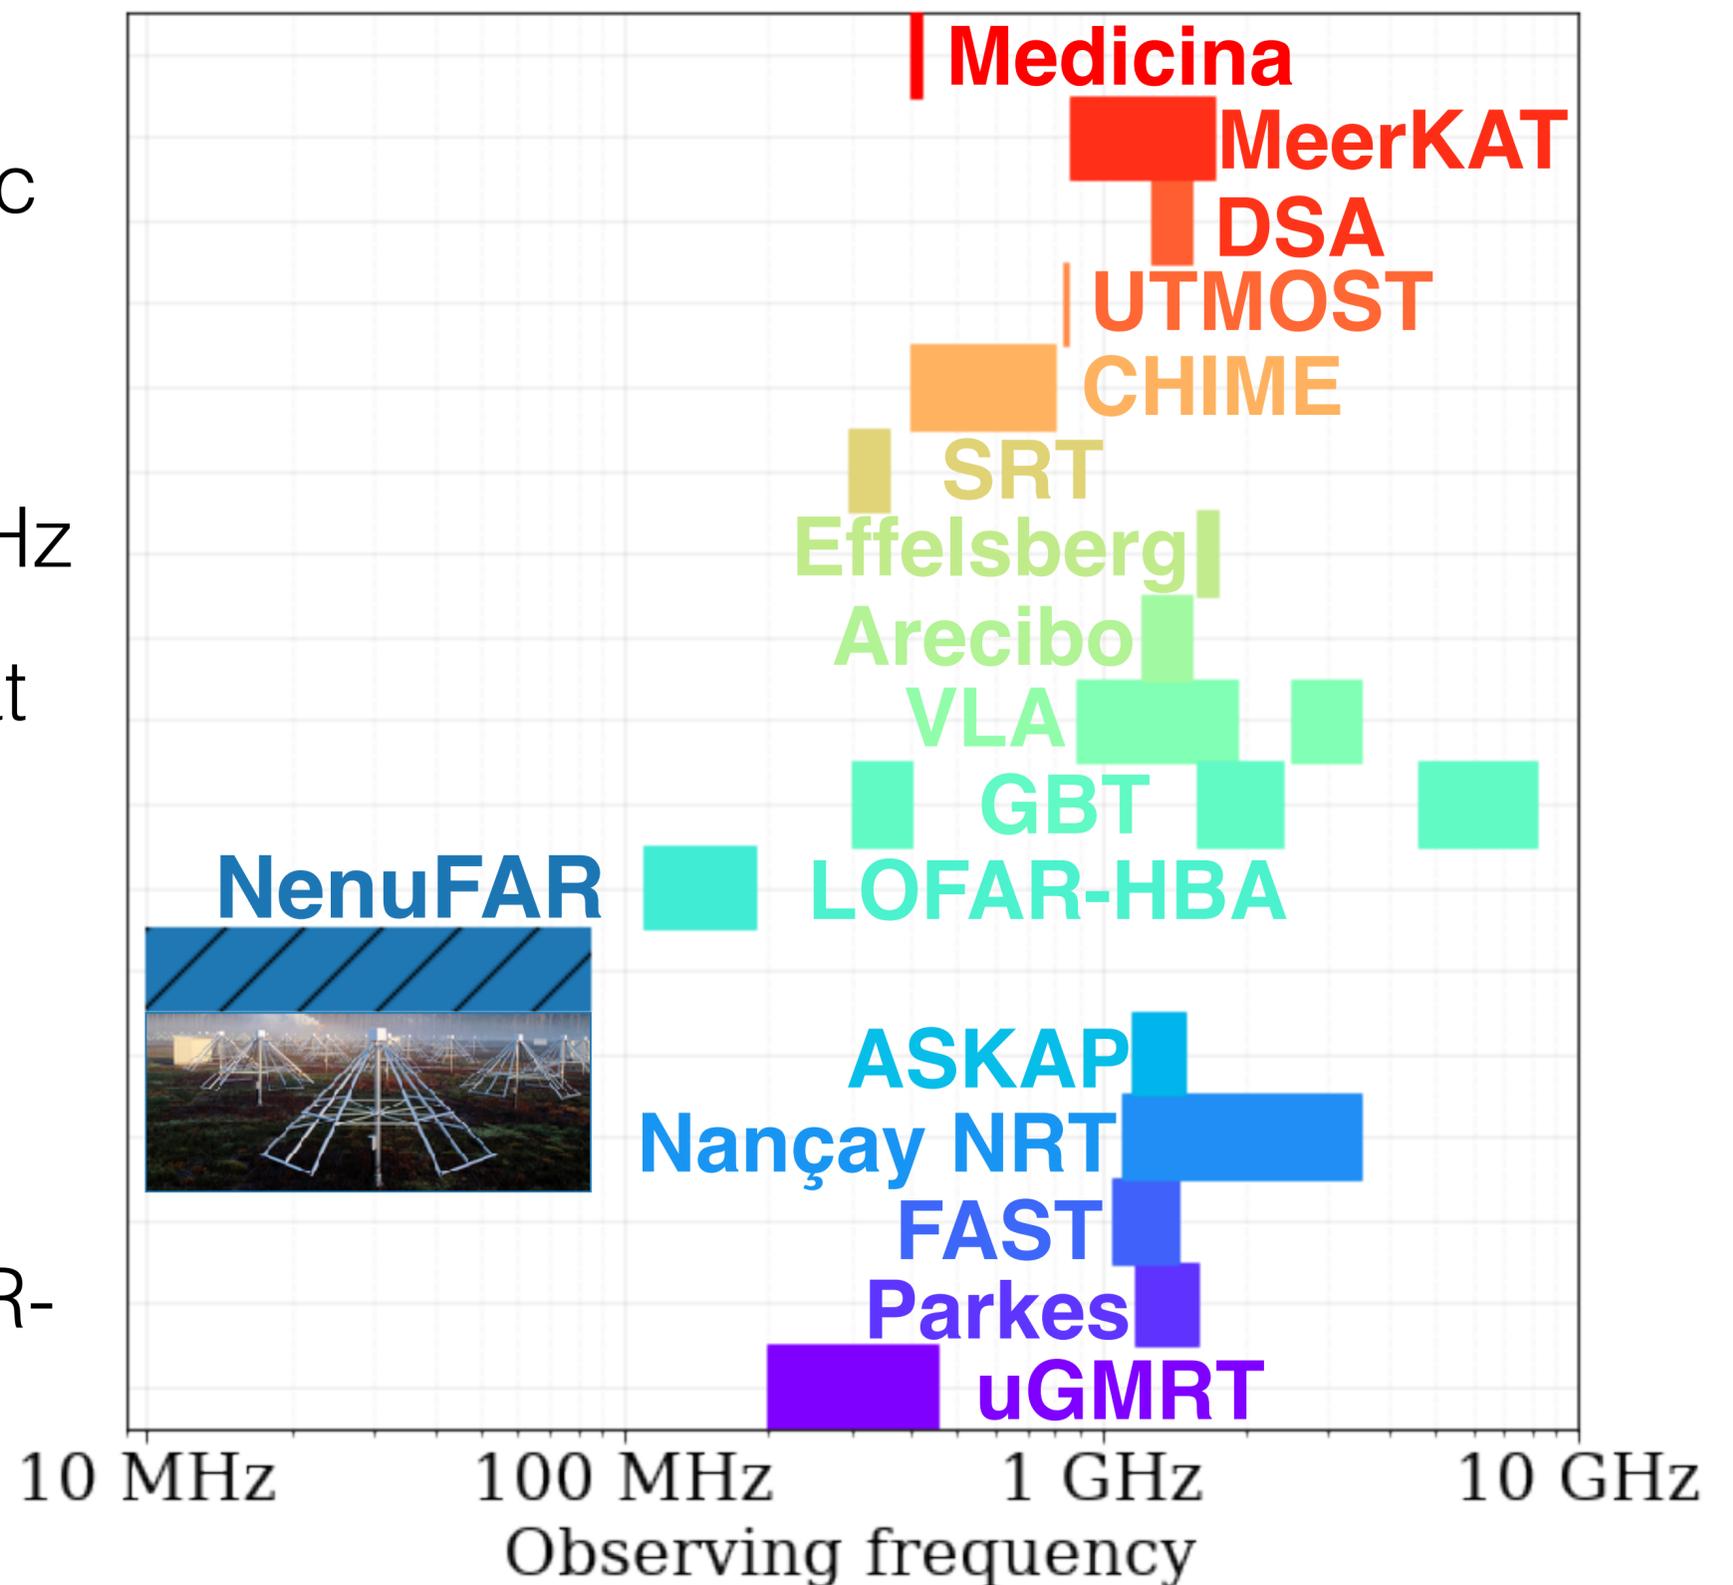

- FRB can be extremely band limited, e.g. UWL receiver detection from Parkes of FRB20190711A.
- Also repeaters seen with LOFAR and CHIME.
- Apparently the second FRB detected by LOFAR was only found in  $\sim 20$  MHz subtended search (Gopinath+, in prep)
- Good to have broad-band receiver but might want to also search with limited band

Repeater FRB20190711A

Repeater FRB20180916B

# FRB emission frequencies

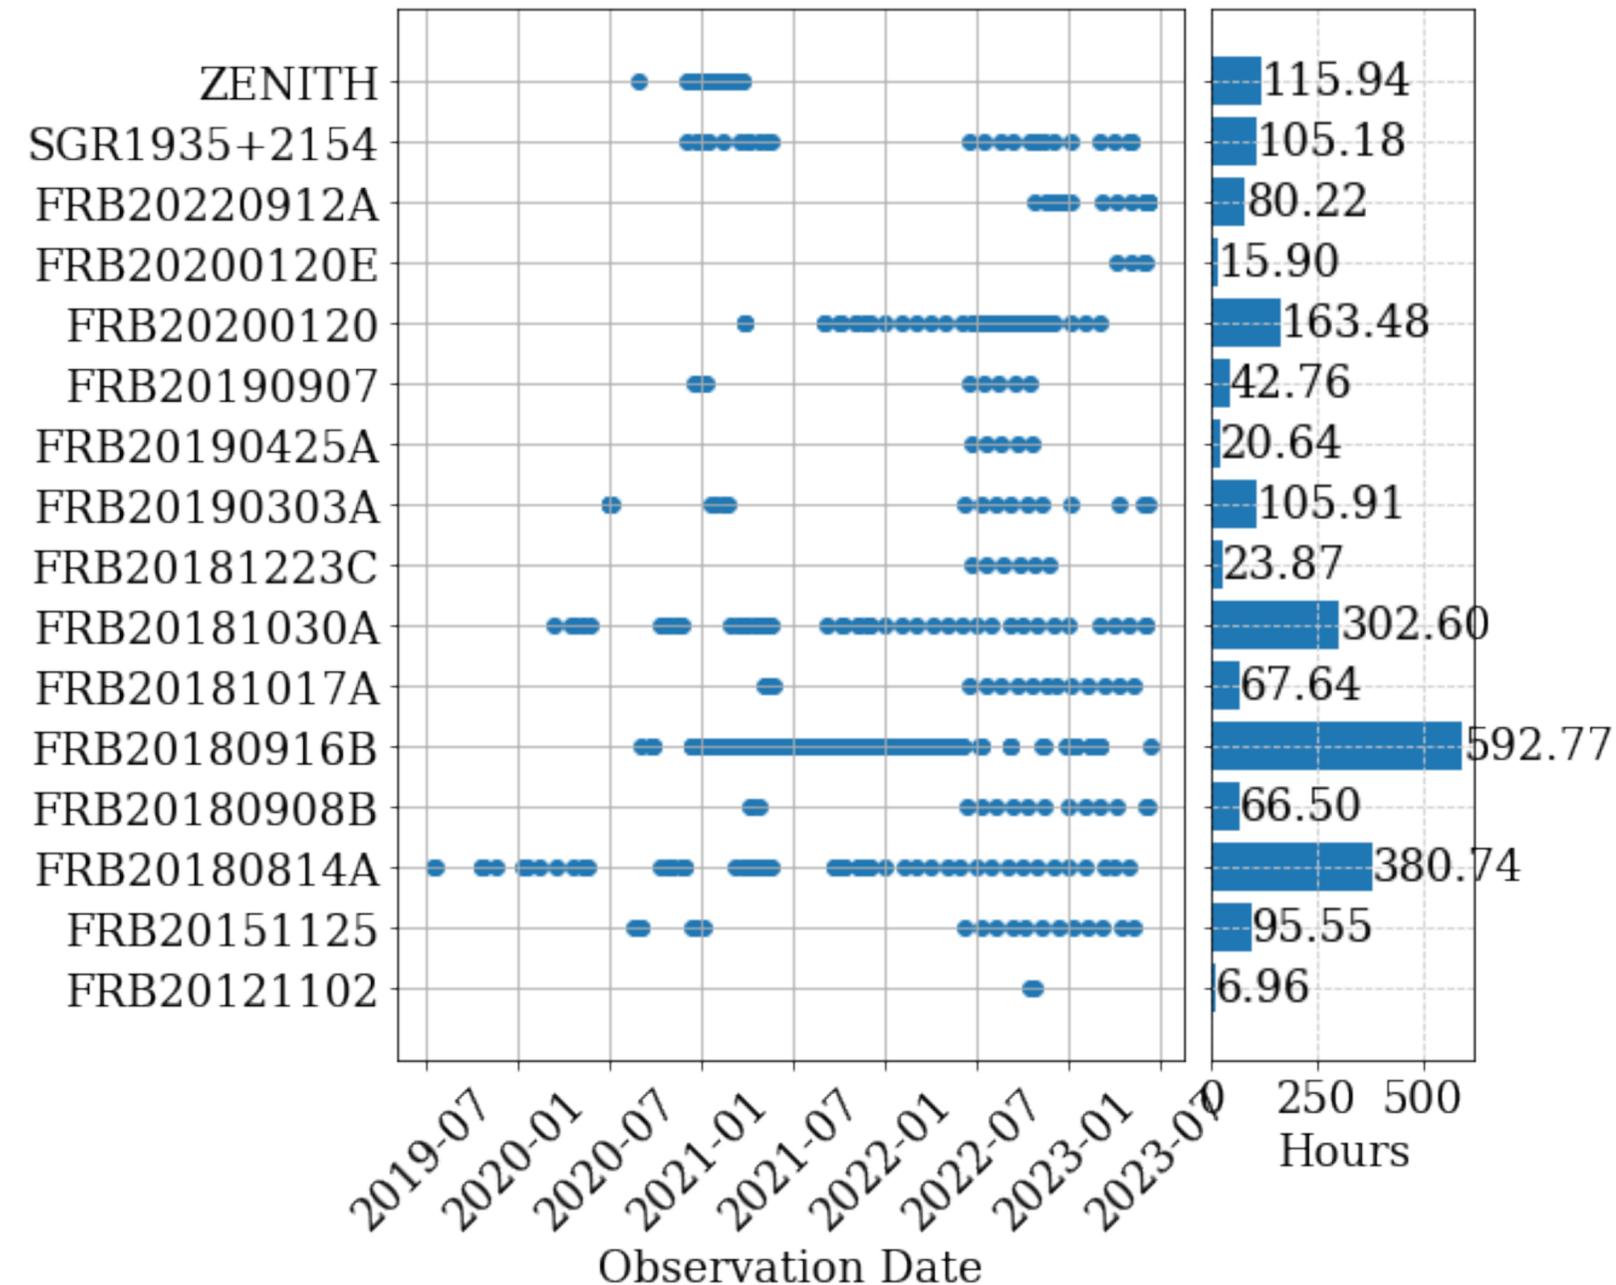

- no conclusive multi-wavelength counterparts yet, except the Galactic magnetar FRB
- So far detected by 16+ radio telescopes between 110 MHz - 8 GHz
- NenuFAR can open a new window at low frequencies — study emission mechanisms
- Low freq detection particularly good for cosmology (clean)
- But seems quite challenging: LOFAR-HBA only detected 2 FRBs so far

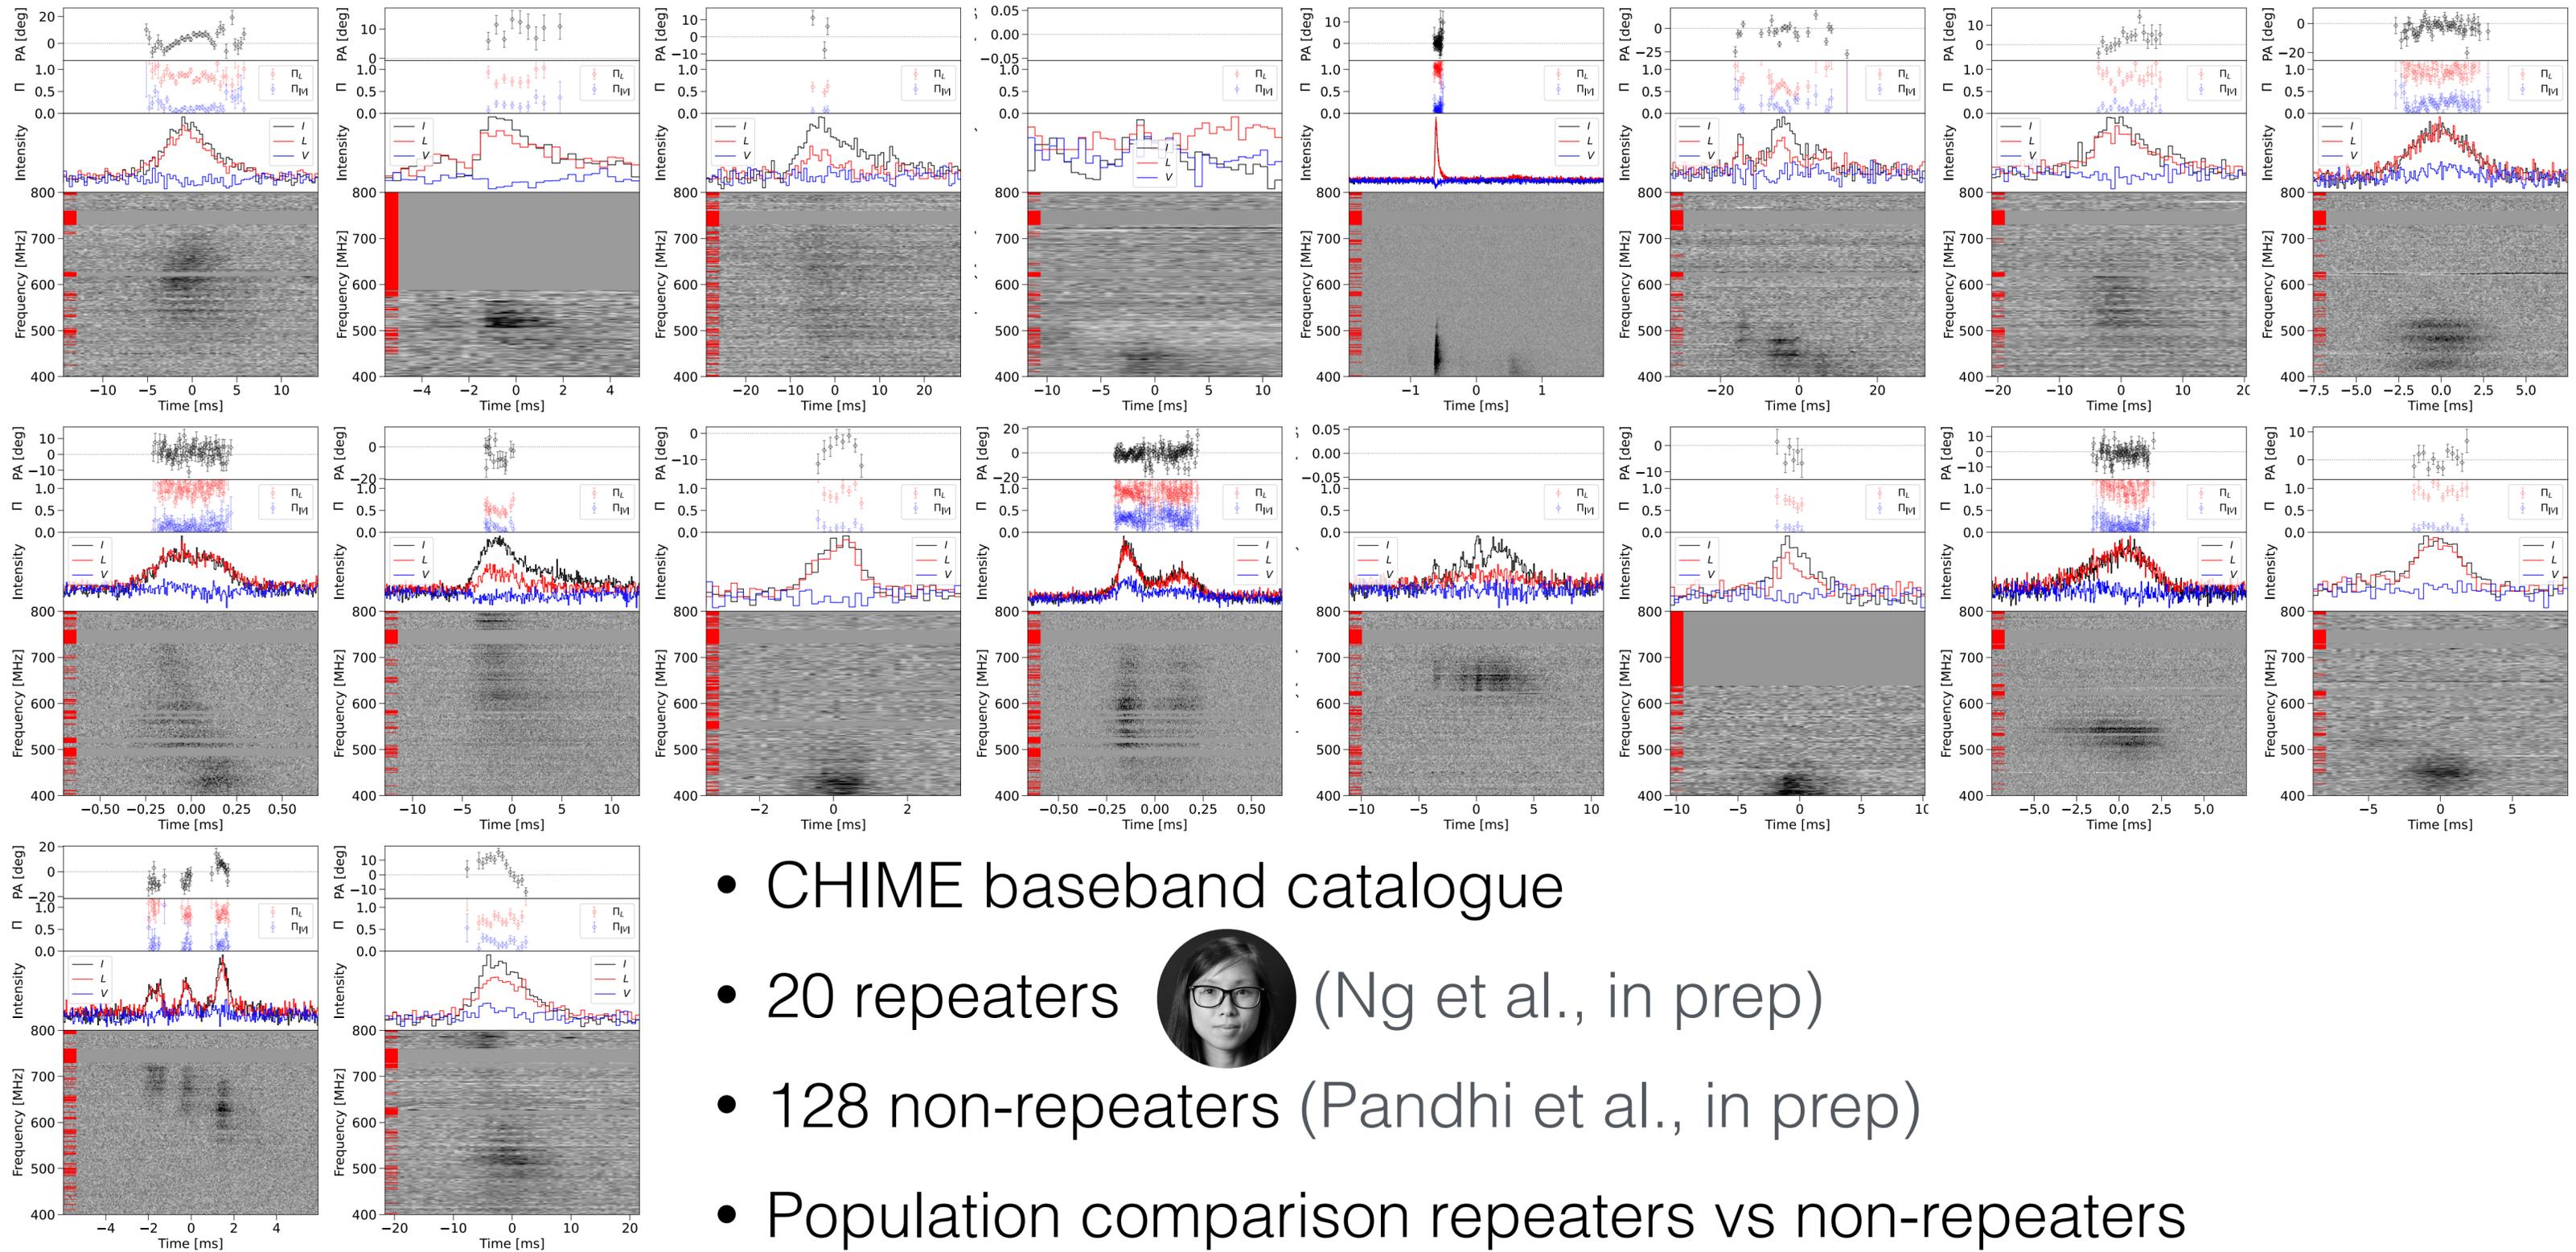

# Campaign with NenuFAR

- Program led by  Valentin Decoene with collaboration from  Philippe Zarka and the Orléans team
- Monitoring 11 repeaters
- >500 observation (>200 hours)
- Initial analysis did not find anything
- Next: sub-band search and ML
- Possibility of triggered observations?  
Low-frequency emissions arrive systematically some days after higher frequencies

Summer student Gaspari  
+ Ng+ Griessmeier

# CHIME polarization study

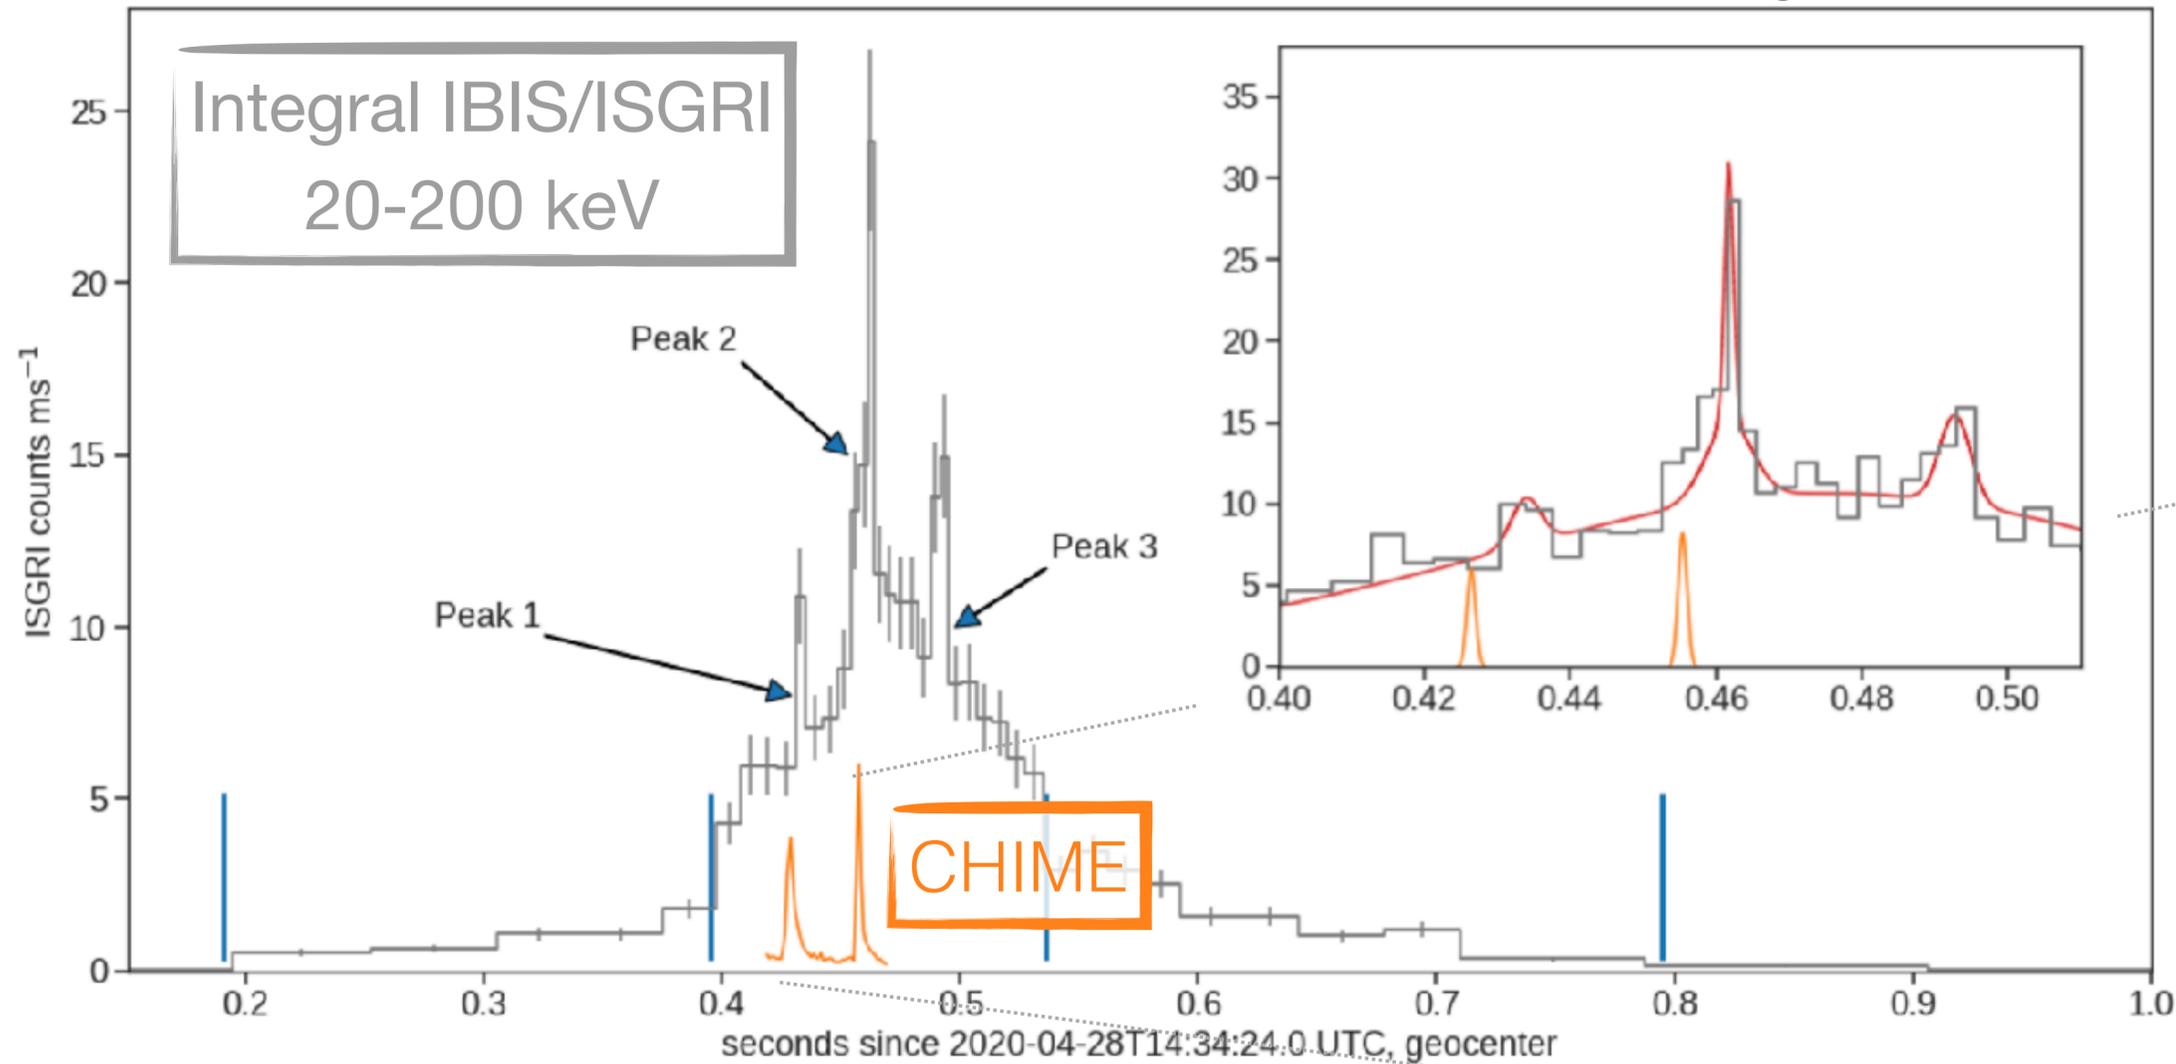

- CHIME baseband catalogue
- 20 repeaters  (Ng et al., in prep)
- 128 non-repeaters (Pandhi et al., in prep)
- Population comparison repeaters vs non-repeaters

# Origin of FRBs

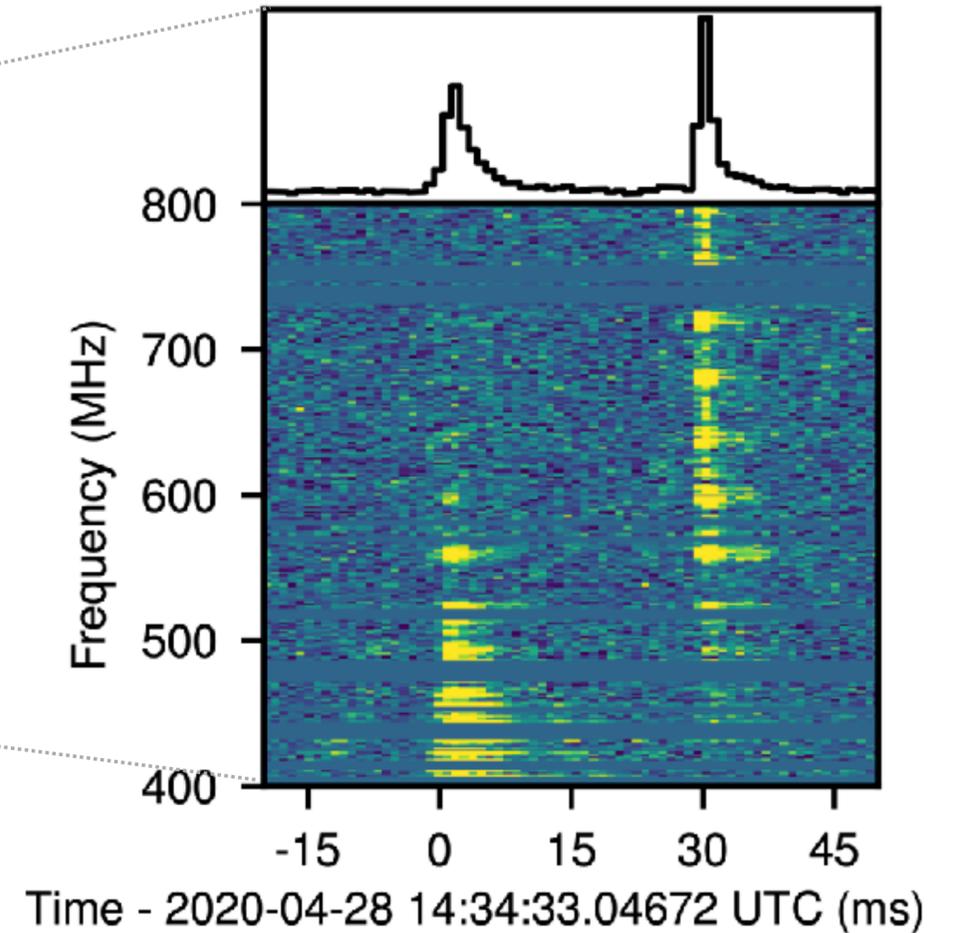

Multi-wavelength observations, Host galaxy and local environments

# Magnetar SGR 1935

Mereghetti et al. 2020

collab. CHIME/FRB, 2020

- Également détecté par NICER, Chandra, XMM, Swift XRT (rayons X), Swift BAT, Fermi, NuSTAR, Integral (rayons Gamma)
- Le pic de rayons X survient 6,5 ms après le pic radio

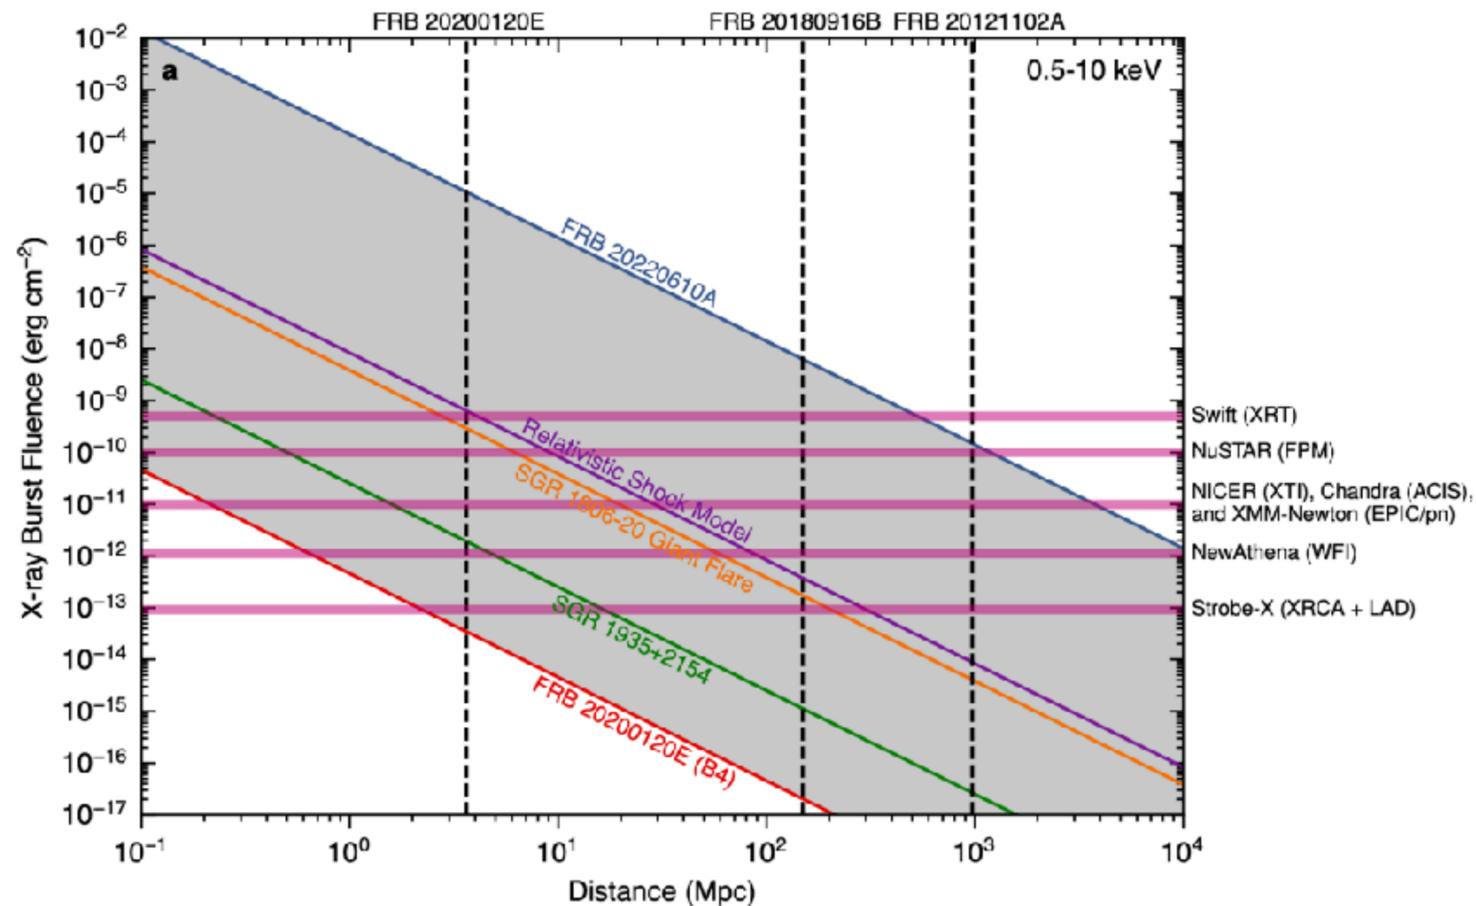

# Multi-wavelength campaigns (non-exhaustive list)

- Multi-telescope campaign for bona-fide (prompt) counterparts
  - Shadow a radio telescope, e.g. MeerKAT + MeerLITCH ← first simultaneous observation (no positive detection)
  - FRB121102 campaign (NRT, Integral, OHP... ) by Christian Gouiffes,  Michel,  Ismaël,  Cherry...
  - X-ray campaign (see next page)
  - Look for coincident CHIME and past GRB detections (Curtin+2022) — no positive detections
  - Deeper Wider Faster: over 50 facilities, targeting transients « proactively », not only FRBs
- Coordinated photometric and spectroscopic follow-up for host galaxy study → F4 collaboration (Keck, Gemini, VLT, Hubble, ALMA, Chandra, VLA, Magellan)

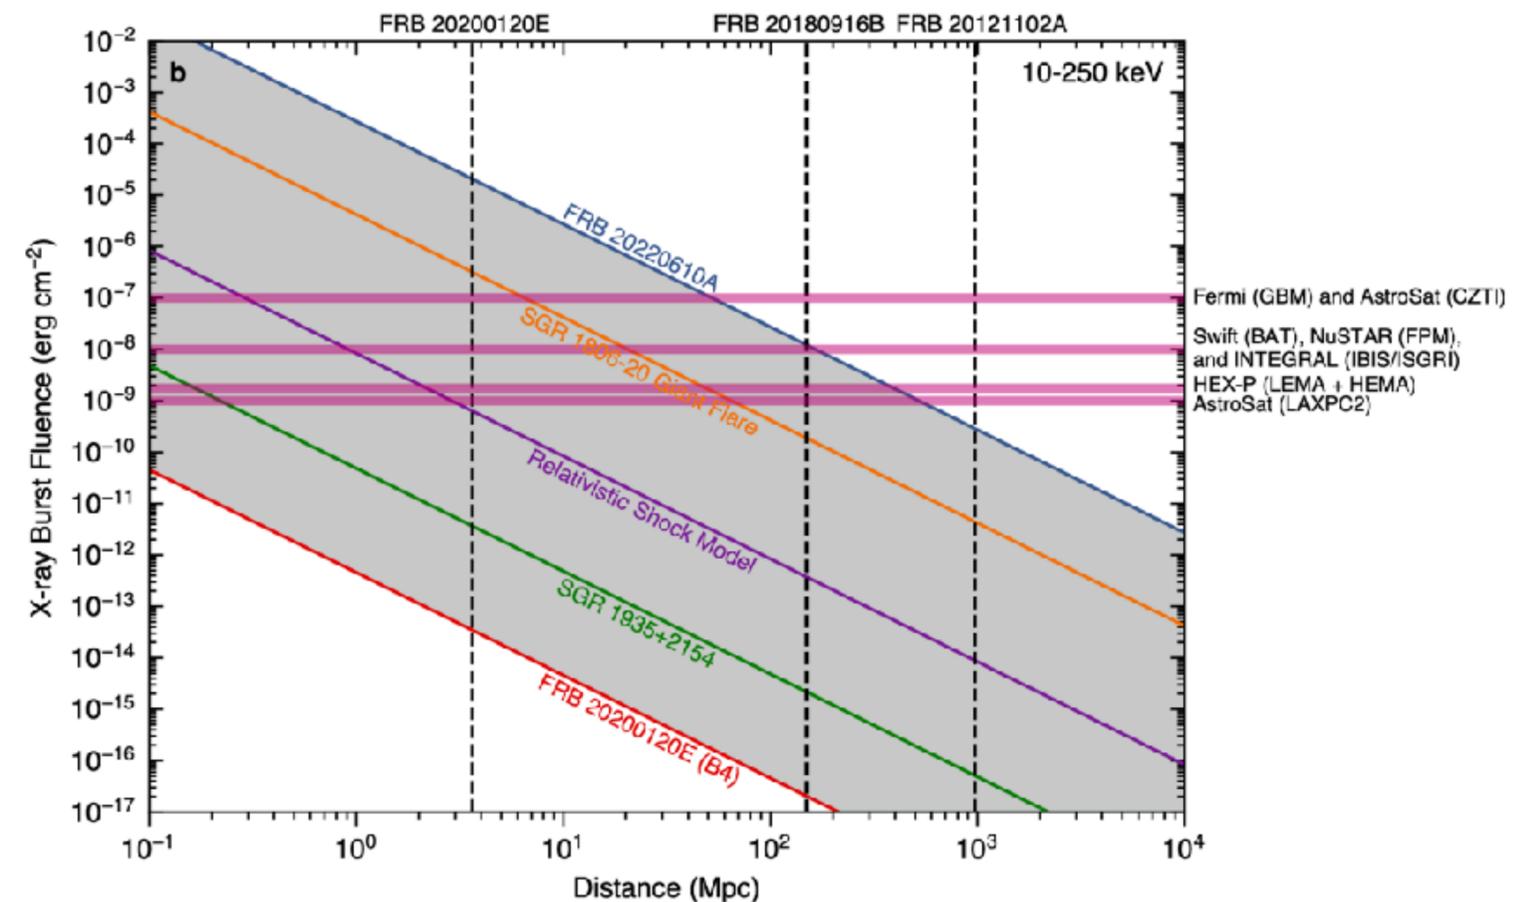

# Low DM, nearby FRBs

- 18 FRBs with  $z < 0.1$   $\leftarrow$  most promising candidates for MW detections?
- Pearman+2023 conducted deep x-ray campaign on FRB 20200120E in Globular cluster (no positive detection)
  - $\rightarrow$  current and future soft X-ray telescopes are promising for detecting FRB  $< 10$  Mpc, hard X-ray is probably too weak

predicted X-ray burst fluences in the soft energy band (0.5–10 keV)

predicted X-ray burst fluences in the hard X-ray band (10–250 keV)

# FRBs host galaxy associations

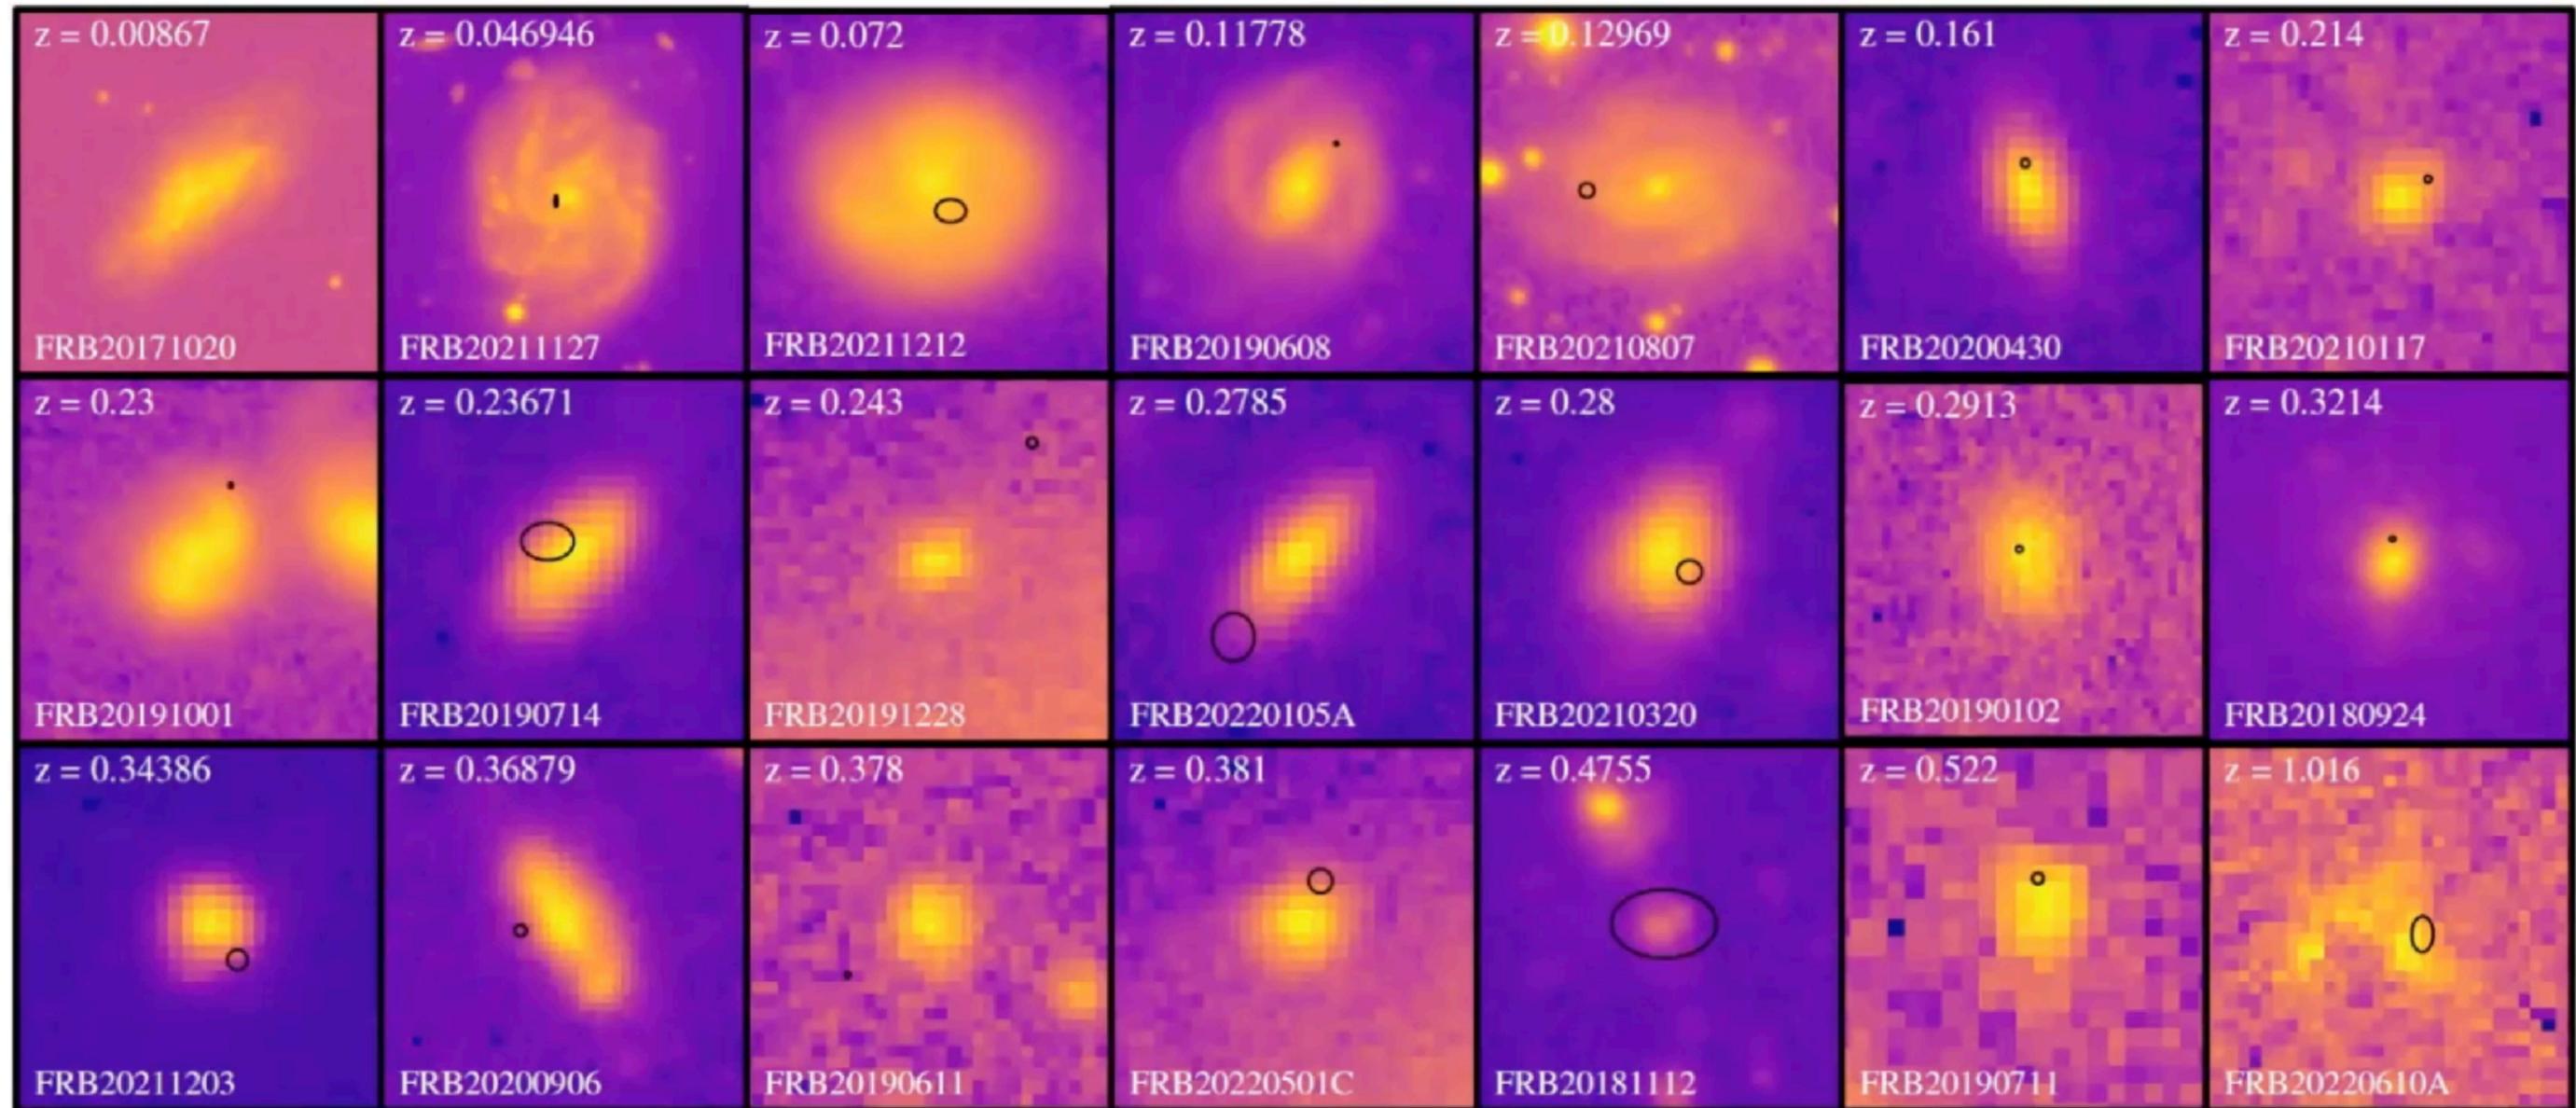

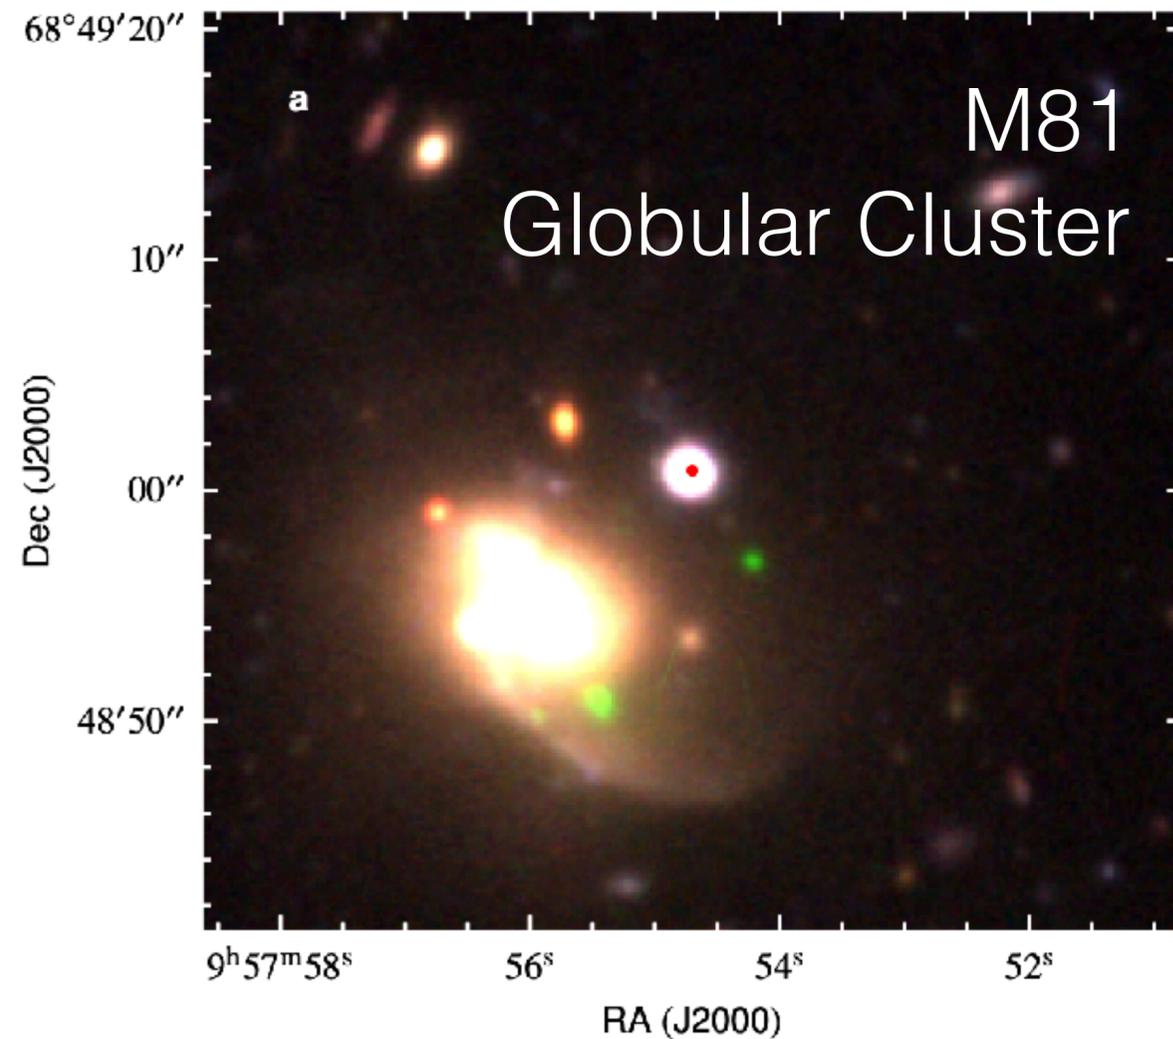

Image de Lachlan Marnoch

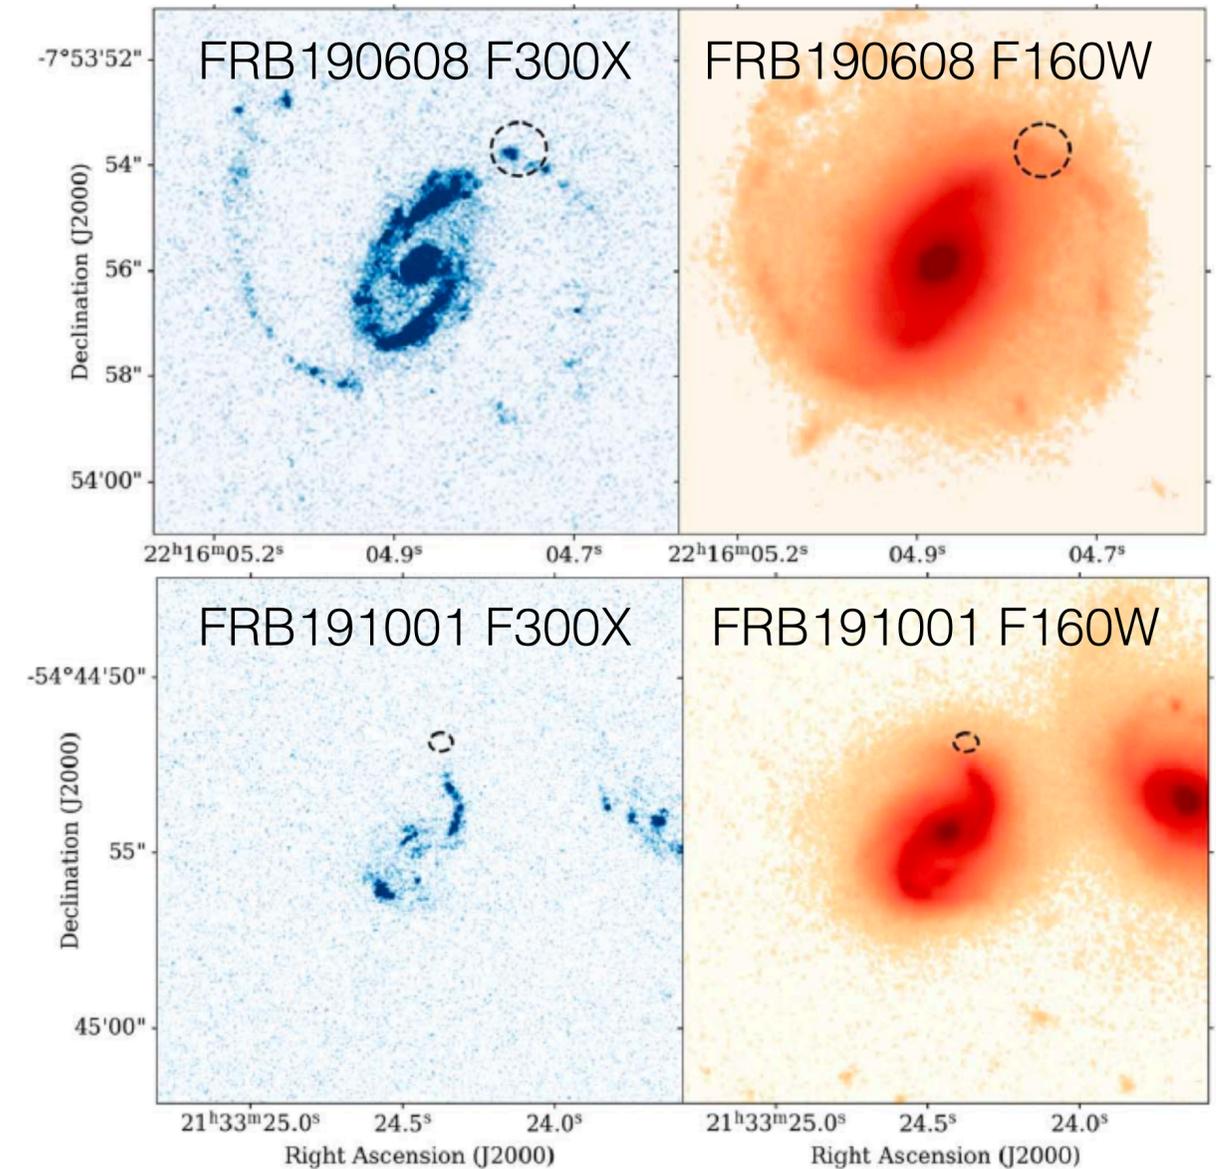

- >40 associations de galaxies hôtes
- Principalement des galaxies en spirales (star forming galaxies), mais aussi des galaxies lenticulaires

# Local environment

Kirsten et al., 2021

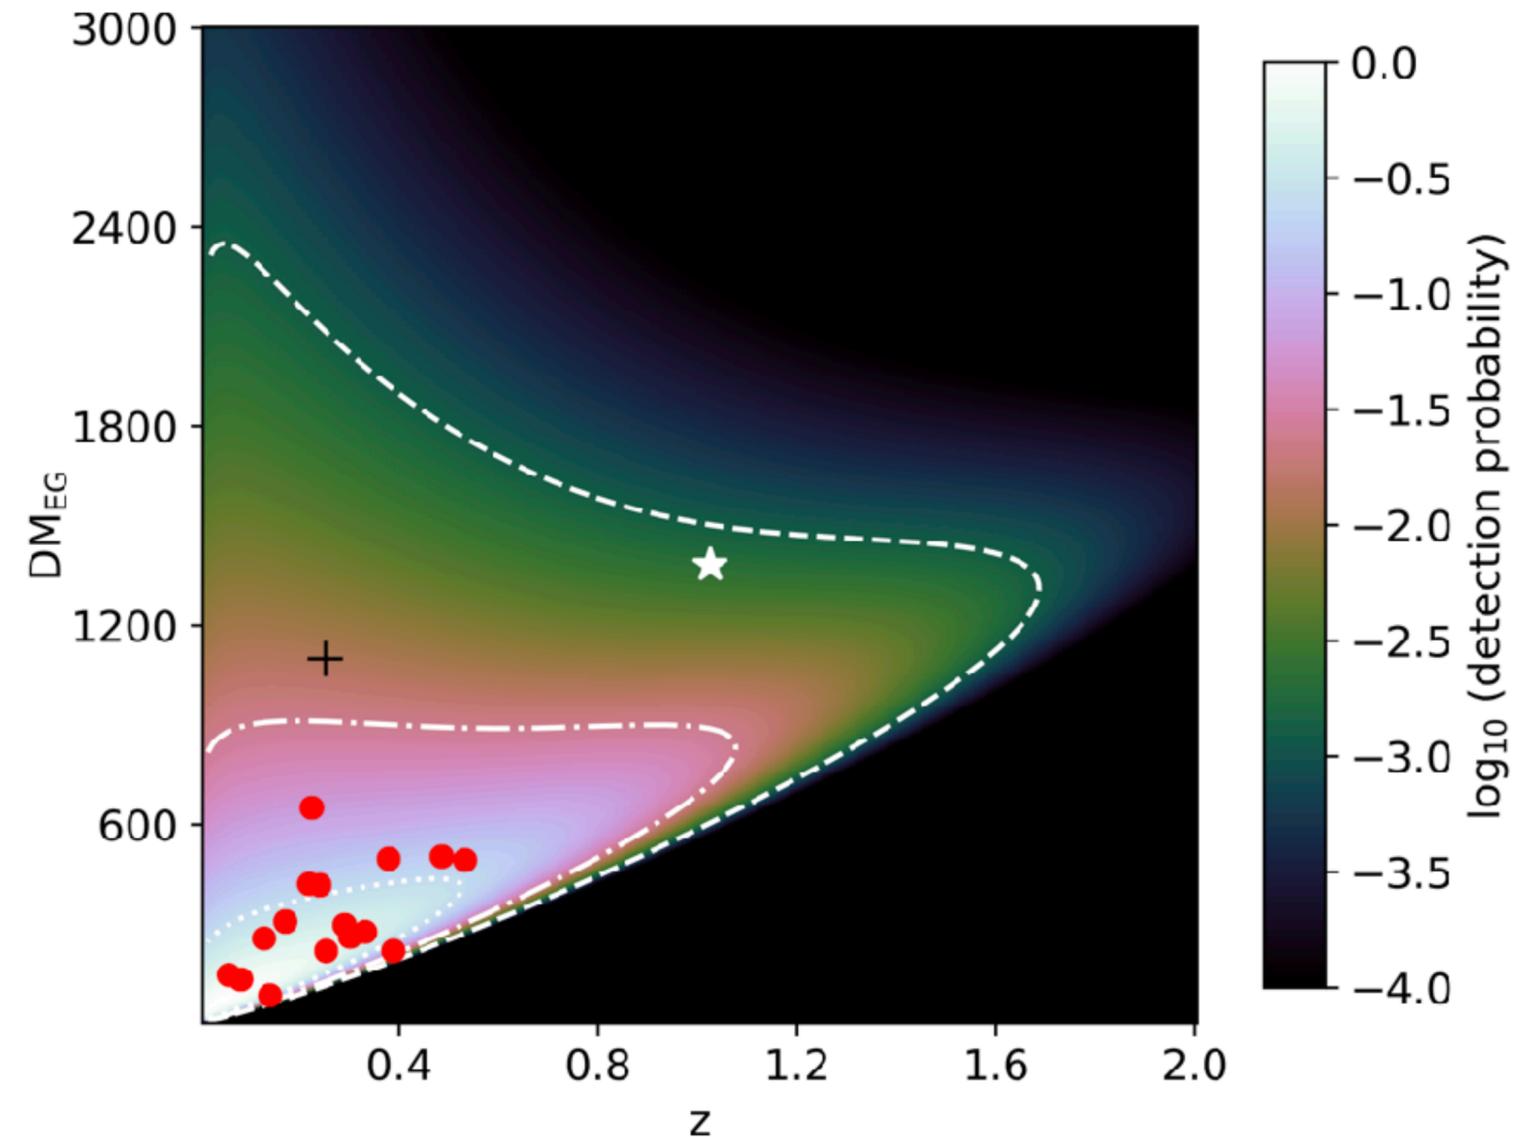

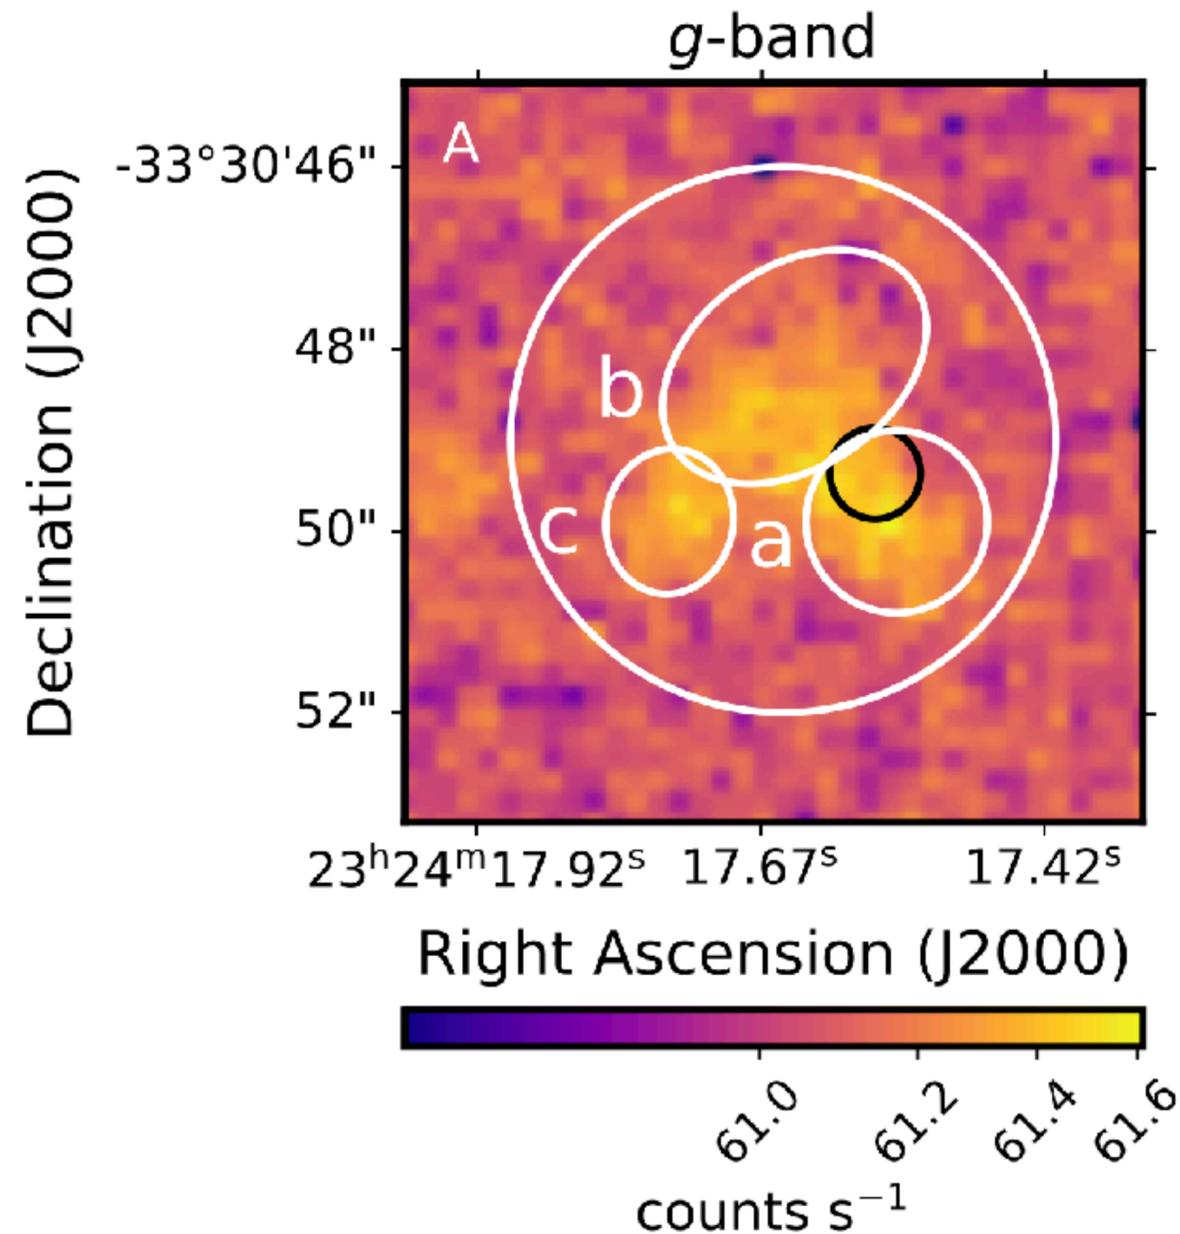

Mannings et al., 2021

Les FRBs proviennent de divers environnements locaux au sein des galaxies hôtes, et pas toujours au centre.

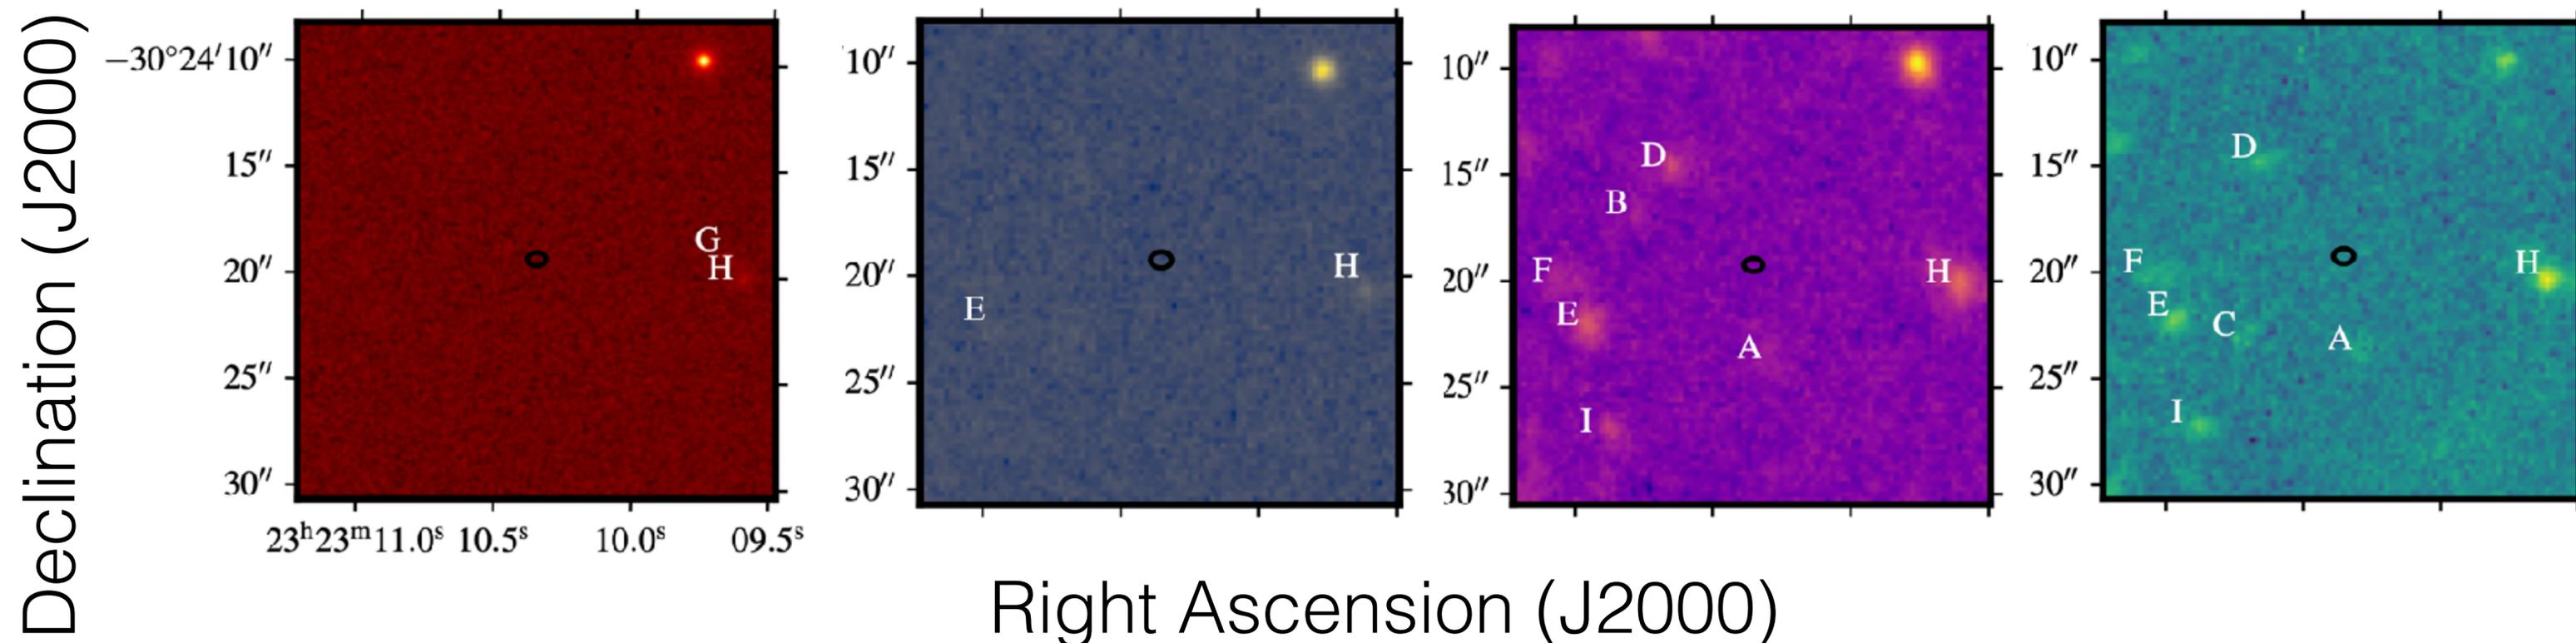

# FRB 20220610A at $z=1$

- ASKAP discovery: morphologically complex host galaxy system with possible signs of interaction (Stuart+ 2023, Gordon+ 2023)
- But also a few  $z > 1.6$  FRBs from MeerKAT announced at FRB2023 conference

# FRB with no host

- ASKAP FRB20210912A - unseen host galaxy despite deep optical ( $R > 26.7$  mag) and near-infrared ( $K_s > 24.9$  mag) VLT imaging  
—> high DM (1233.7) suggests high-redshift ( $z > 0.7$ ) origin (Marnoch+ 2023)
- Could be a problem for cosmology studies if many similar cases
