• Summary and Outlook

Motivation: Shapes and Symmetries

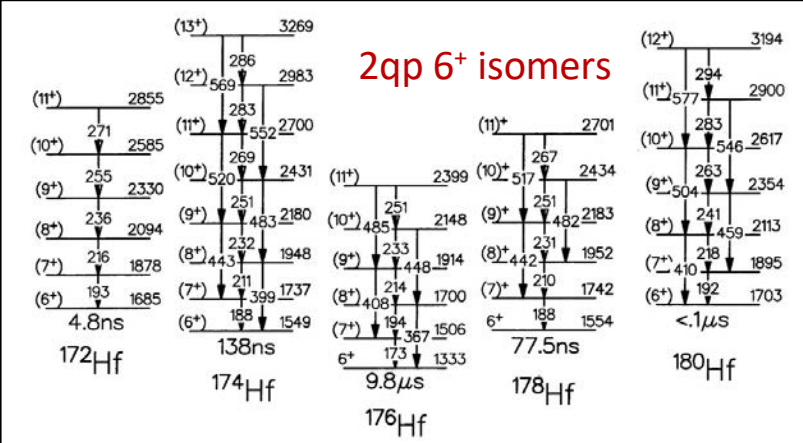

Axial Symmetry: K quantum number and K-Isomers

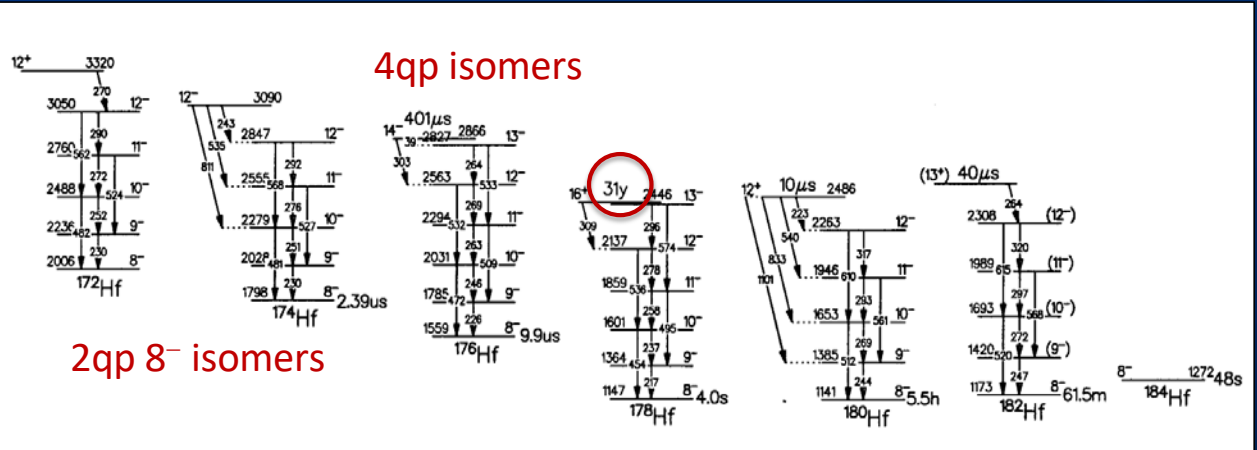

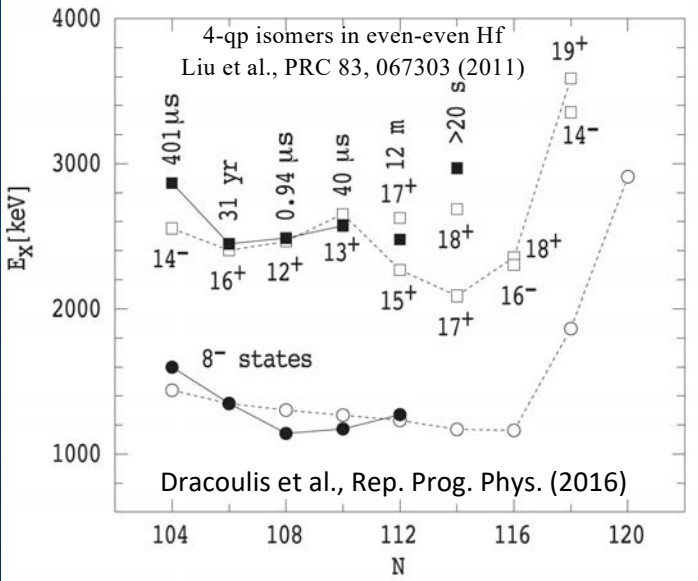

- deformation and axial symmetry
- high- Ω orbitals near Fermi surface
- interplay of intrinsic and collective excitations
- K -selection rule $\Delta K \leq \lambda$ (transition multipolarity)
- transitions hindered if selection rule violated (K -isomers)
- **spectroscopic tool**
- **sensitive probe of nuclear structure**

High-K Isomers: Hf isotopes

- Rigid axial quadrupole deformation
- Multiple high- Ω n and p orbitals near Fermi surface
- Yrast traps predicted in neutron-rich Hf

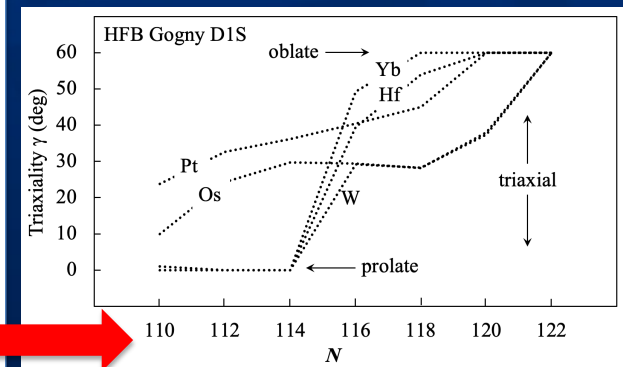

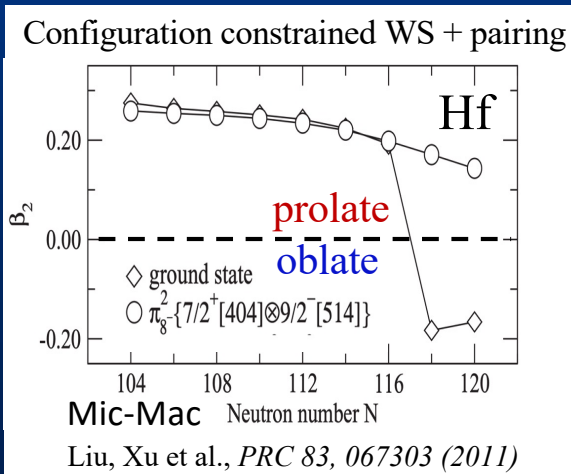

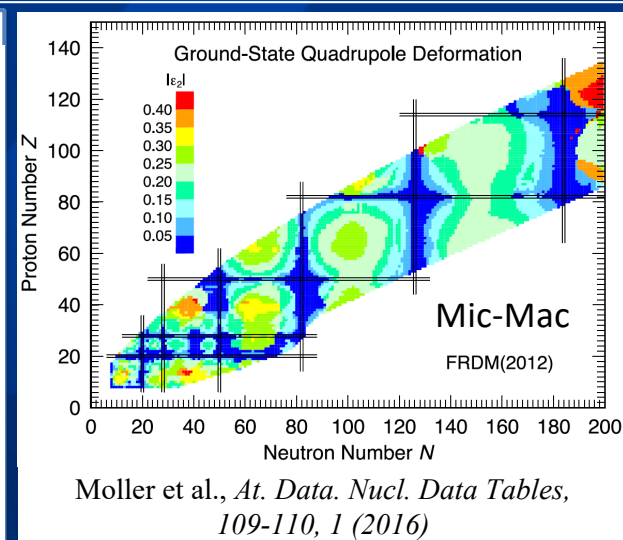

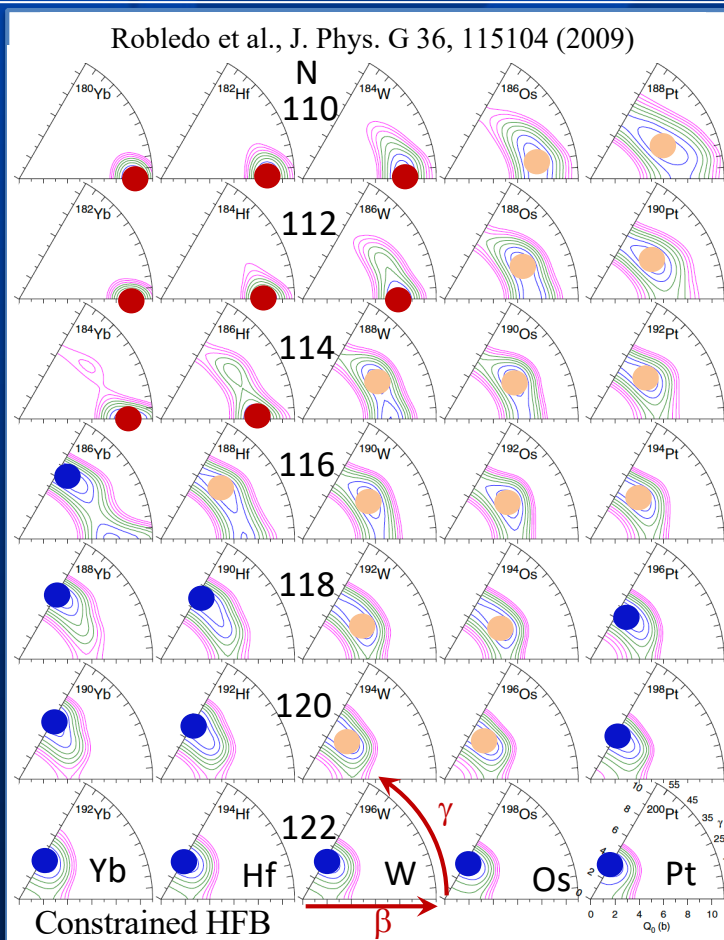

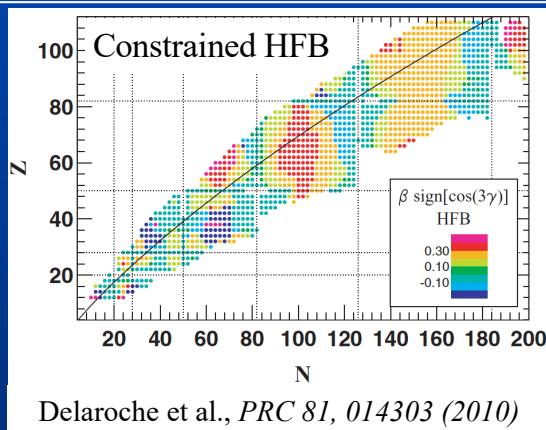

Questions and challenges:

- Nature of shape evolution
- Impact on approximate symmetries
- Accessing the neutron-rich region at moderate angular momenta

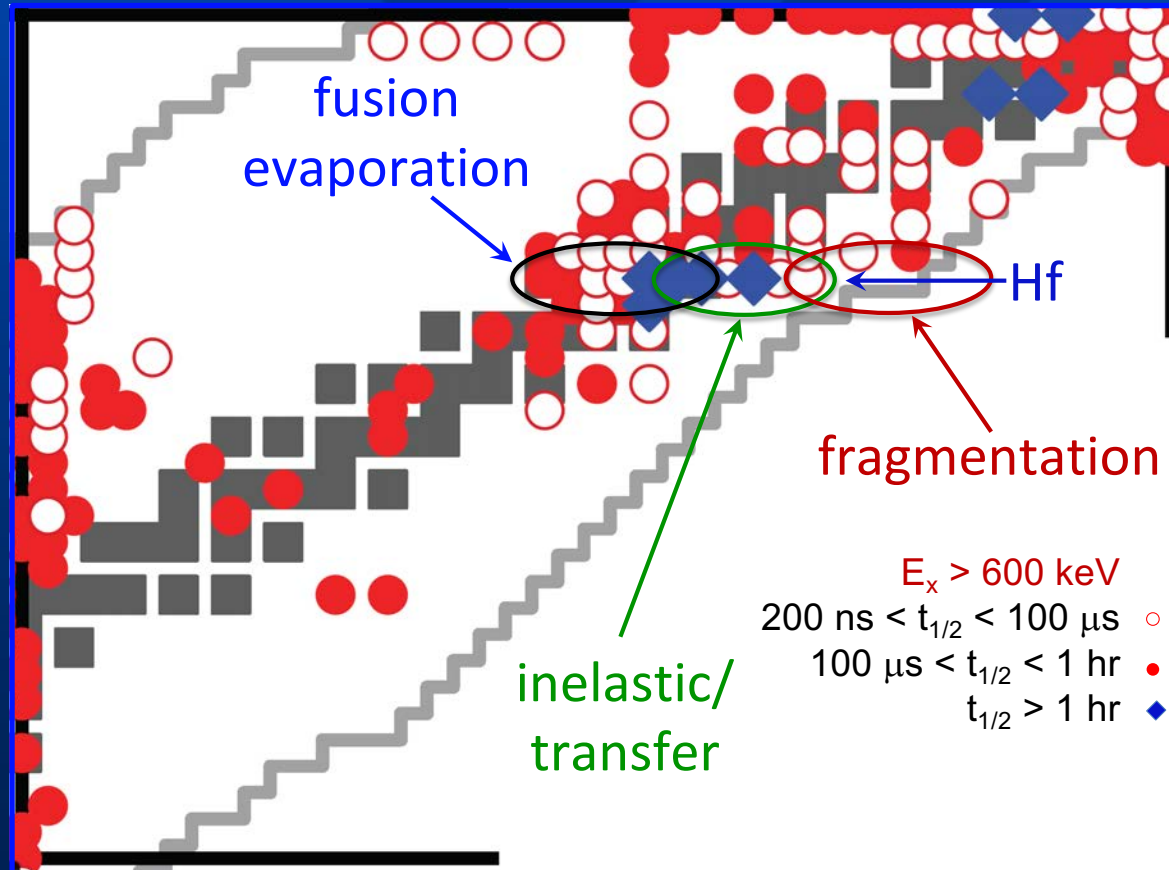

Model Predictions: Shape Evolution

Isomers for Structure Studies

Population Mechanisms

^{198}Pt Fragmentation at NSCL: Overview

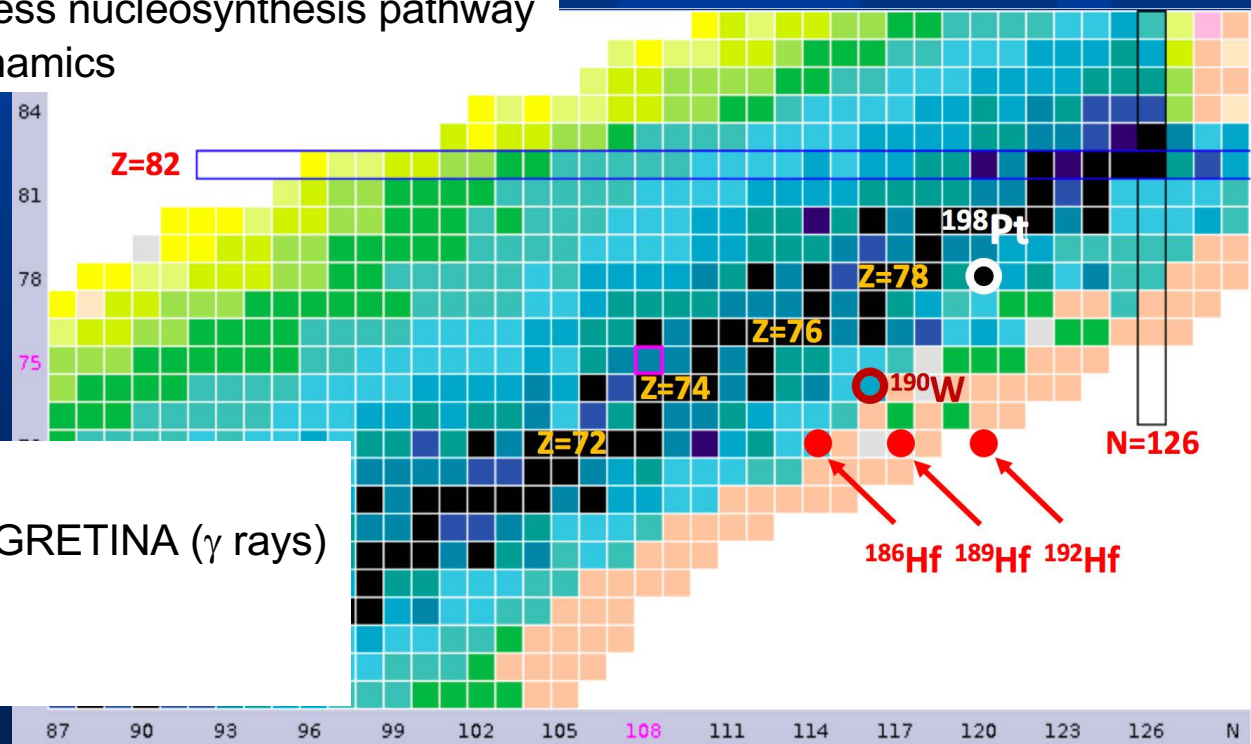

- Nuclear structure: K-isomers in neutron-rich Hf-W region
- Astrophysics: $A=190$ region r-process nucleosynthesis pathway
- Isotope discovery and reaction dynamics

Isomers in $180 < A < 190$ region

First experiment with newly developed ^{198}Pt beam at NSCL

Stopped beam experiment:

- Si stack (implants) surrounded by GRETINA (γ rays)
- Implant- γ coincidences
- Half-lives and level schemes

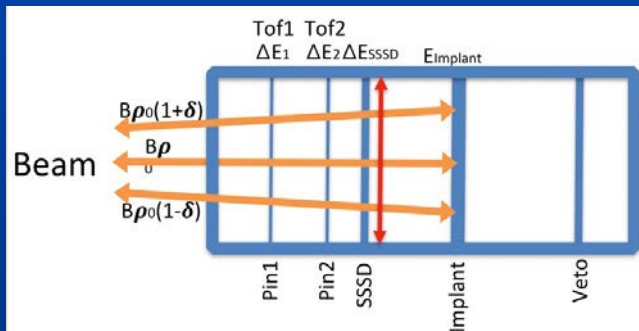

A1900@NSCL: e15130 Experimental Setup

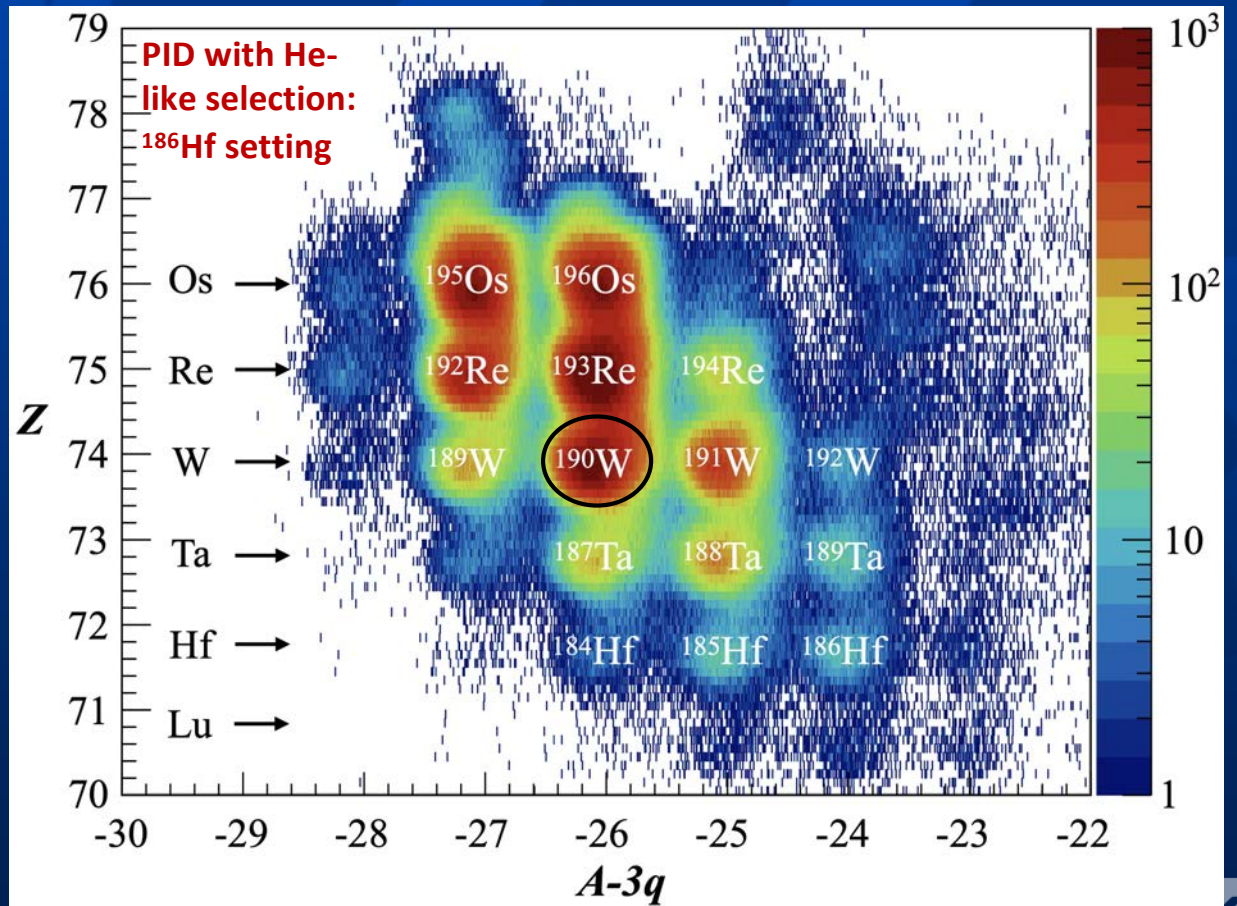

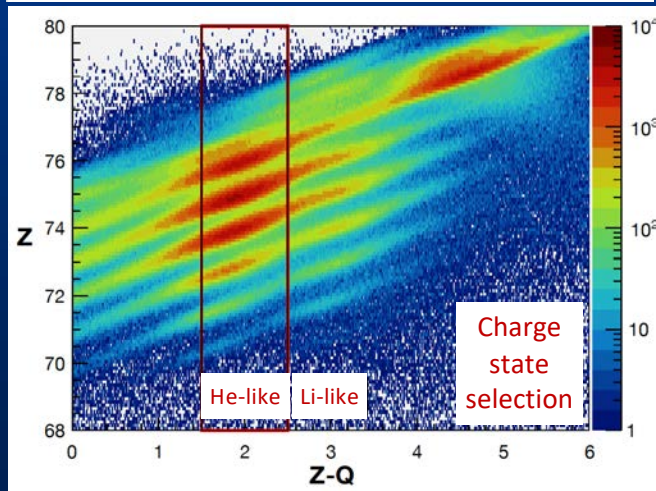

- Primary Beam : ^{198}Pt (85MeV/nucleon)
- Main 3 settings: ^{186}Hf , ^{189}Hf , ^{192}Hf
- $\Delta E - B\rho - TKE - ToF$ Particle Identification event-by-event $\rightarrow (A, Z, Q)$
- Isotopes produced in isomeric states

^{198}Pt Fragmentation at NSCL: Particle Identification

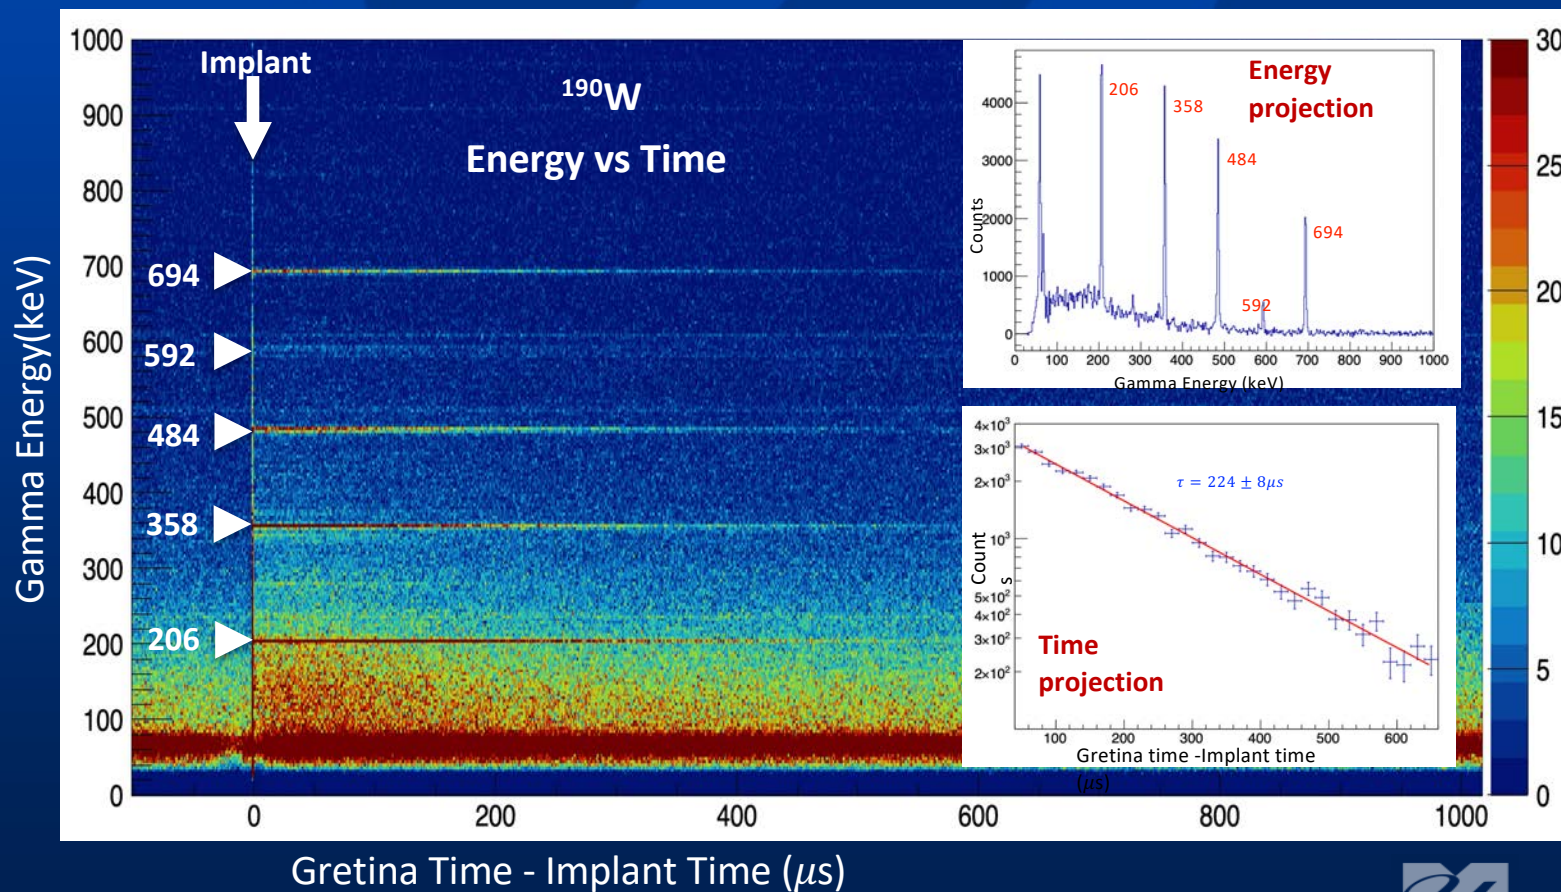

$$\text{TKE} = \Delta E_1 + \Delta E_2 + \Delta E_{SSSD} + E_{\text{implant}}$$

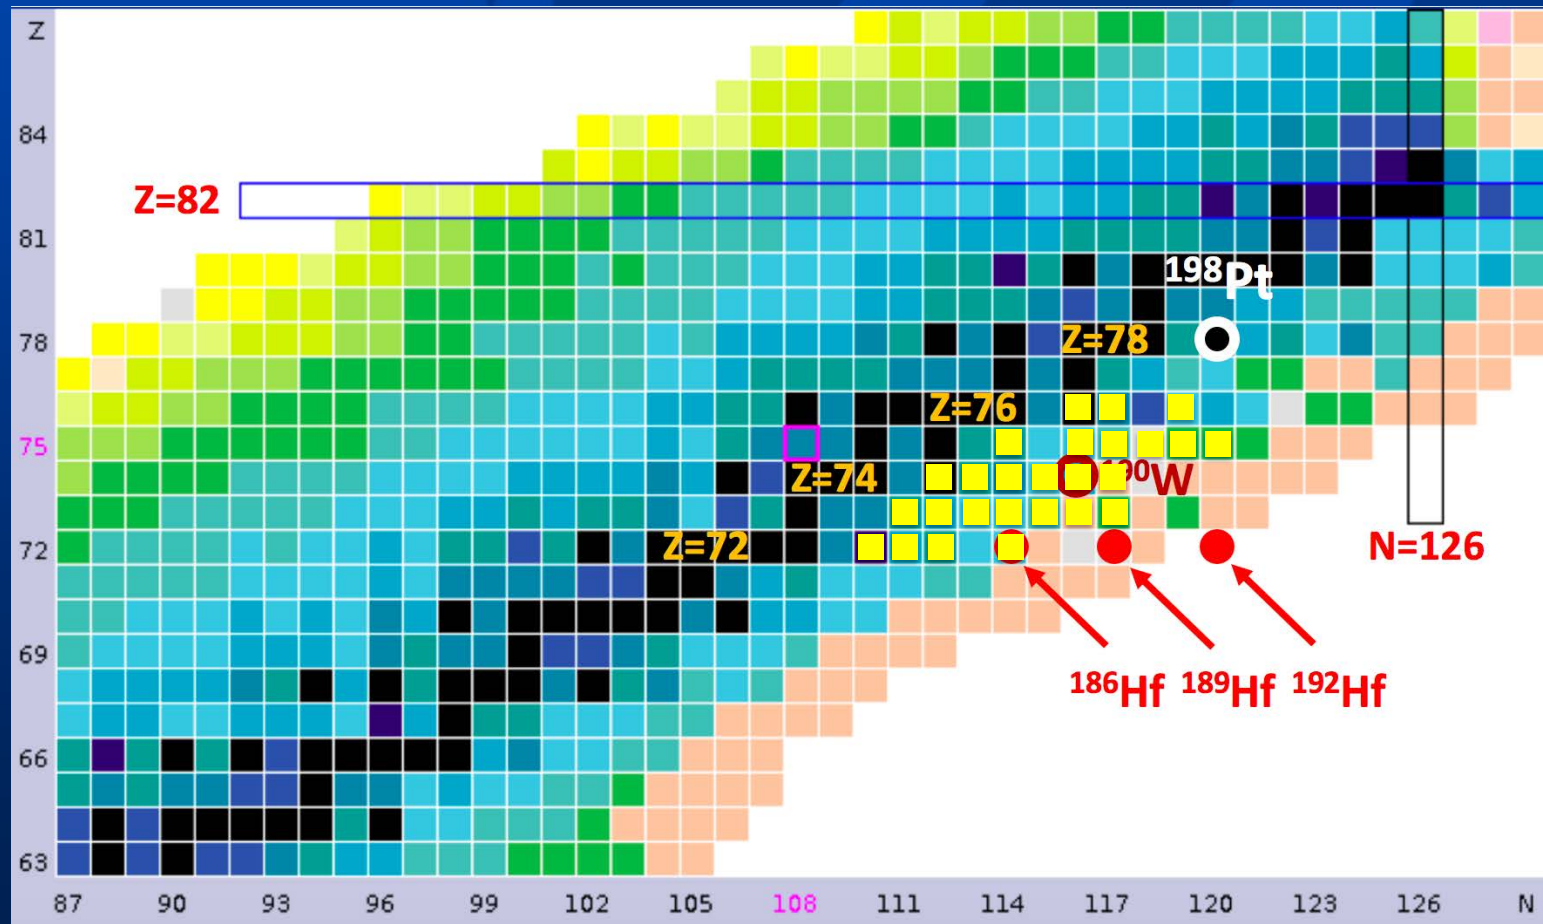

^{190}W : Implant-Decay Correlation

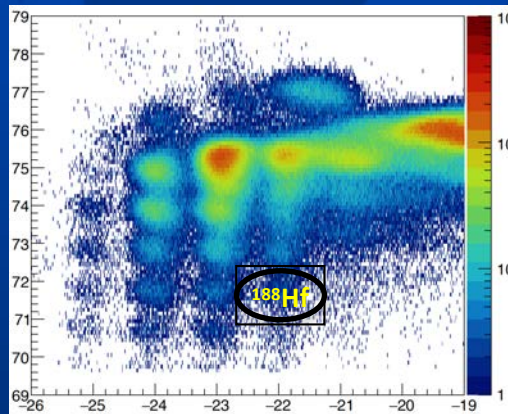

G. Lane et al., PRC 82,
051304 (R), 2010
via multi-nucleon transfer

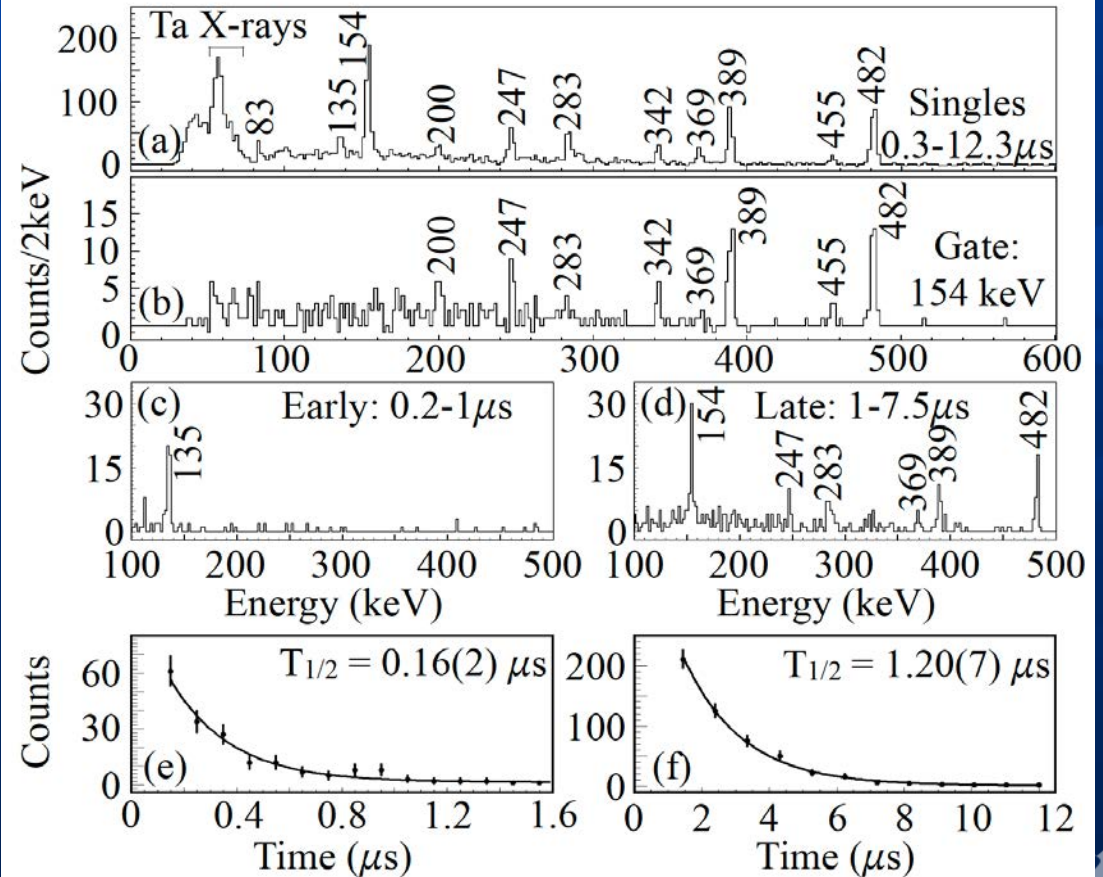

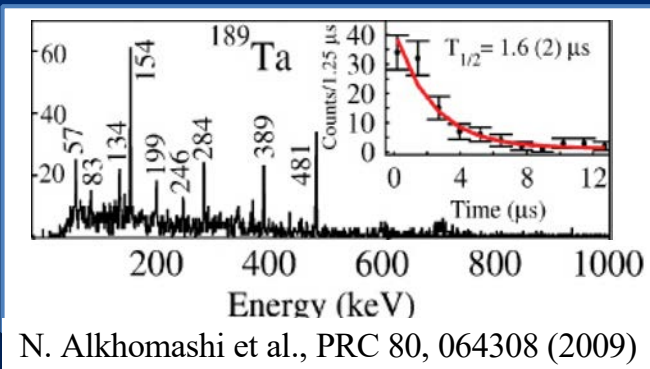

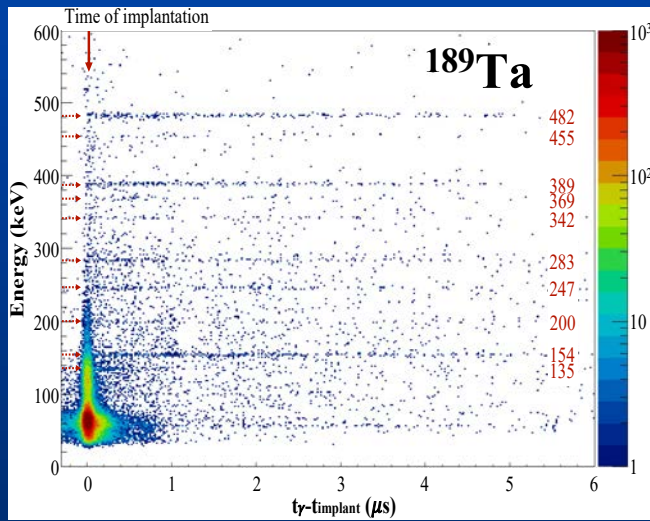

Isomer Landscape

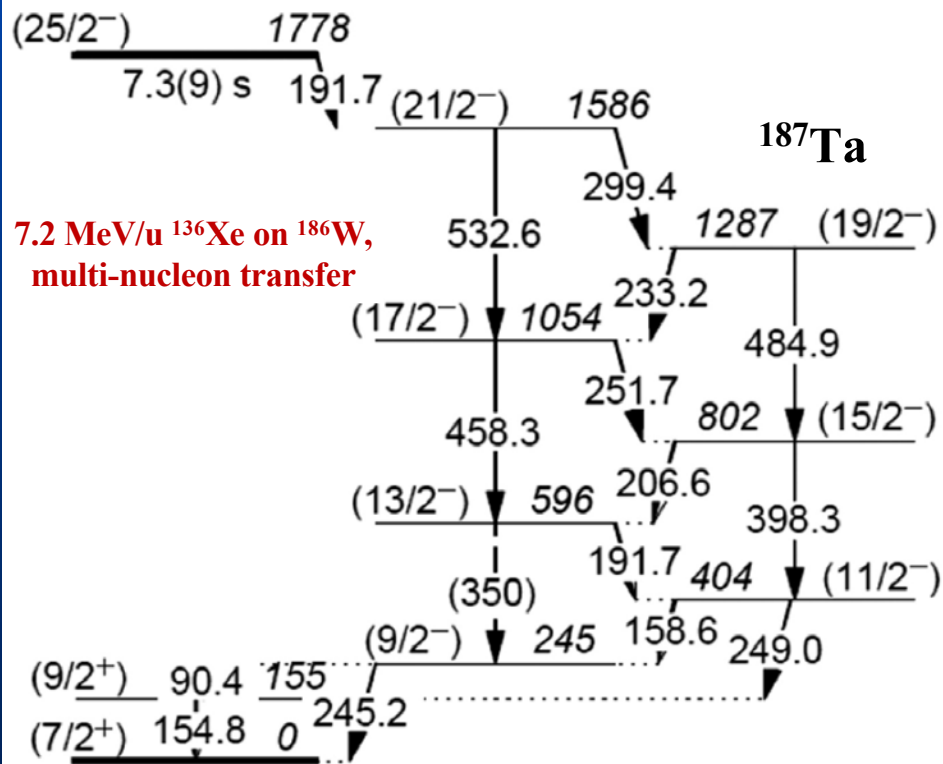

Neutron-rich terra incognita - Even-Even Hf

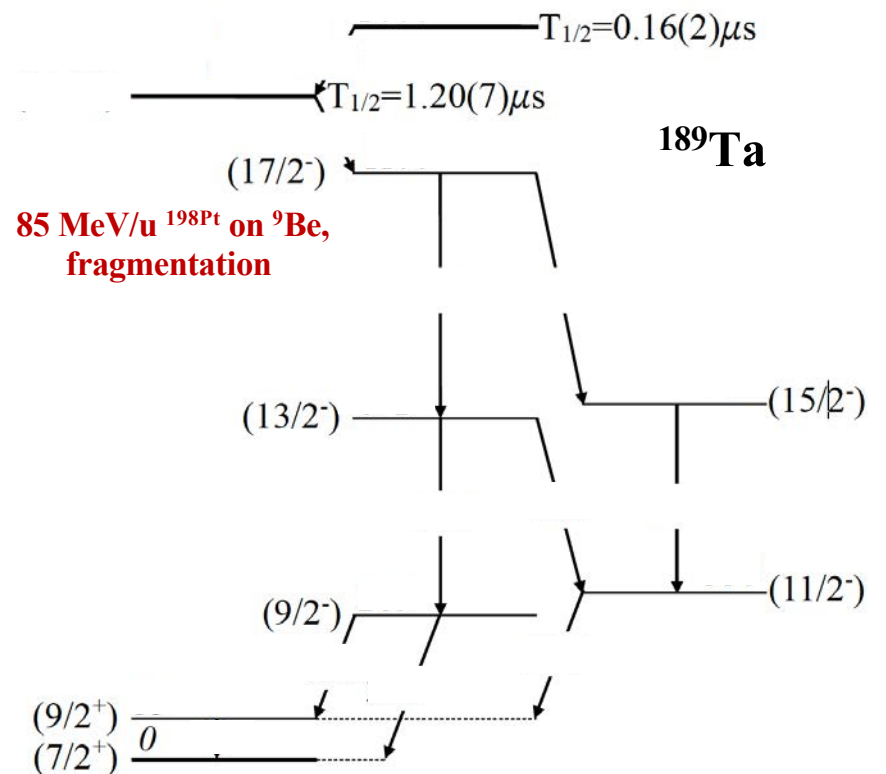

^{189}Ta Spectroscopy: Fragmentation + GRETINA

First Level Scheme of ^{189}Ta : 8 neutrons beyond stability

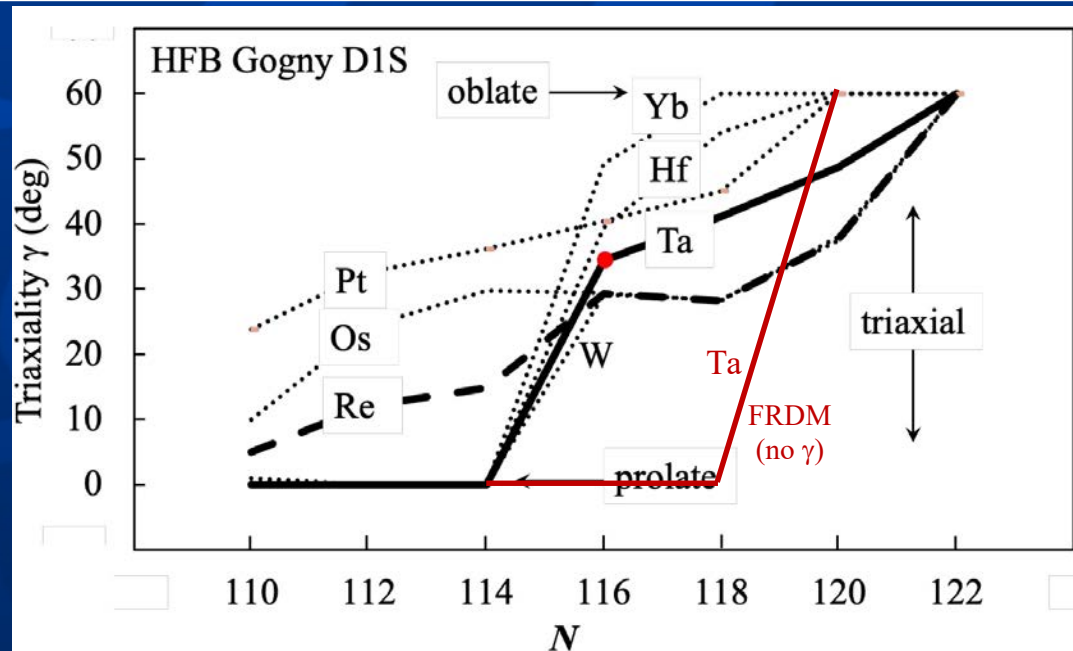

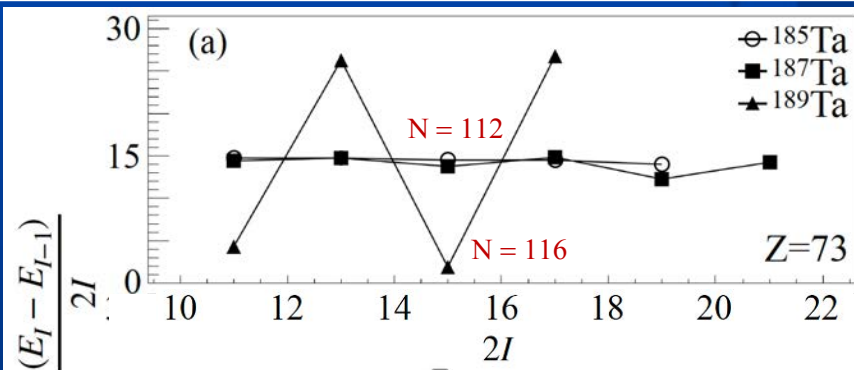

P.M. Walker et al., PRL 125, 192505 (2020)

K. Sharma et al., submitted to PRL (2024)

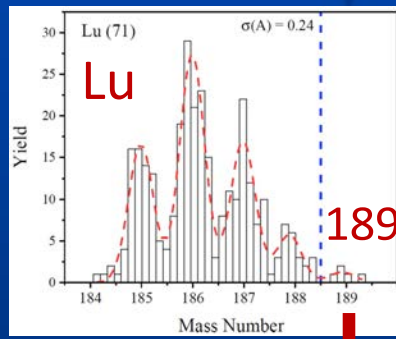

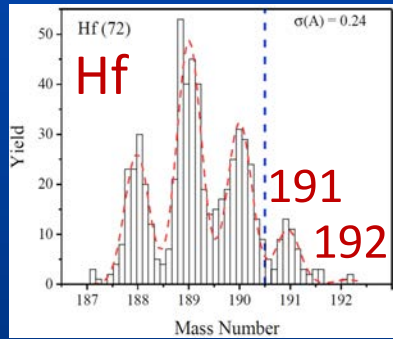

Reaching the Prolate-Oblate Boundary

Large staggering (signature splitting) in ^{189}Ta rotational band
 Sharp transition to strong triaxial shapes in ^{189}Ta ($N=116$) at the prolate-oblate boundary
 Agrees with HFB predictions but not with FRDM
 Decrease in K -hindrance consistent with loss of axial symmetry

K. Sharma et al., submitted to PRL

Isotope Discovery

Reaction Dynamics: Angular Momentum in Fragments

Populating isomeric states up to $I \sim 18\hbar$

Summary and Outlook

- First fragmentation of ^{198}Pt beams
- $\Delta E - B\rho - \text{TKE} - \text{TOF} \rightarrow \text{PID}$ Si SSSD $\rightarrow \Delta(B\rho)$ GRETINA $\rightarrow \gamma\text{-}\gamma$ coincidence power
- Isotopes implanted in ($\sim 10\%$) isomeric high spin states
- Half-life sensitivity between ~ 400 ns (flight path) and ~ 10 ms (implant rate)
- Many isomers identified in neutron-rich landscape (more results in queue)
- Half-life of 2-qp Hf isomers out of range, μs 4-qp isomers identified in $^{184,186}\text{Hf}$
- **First level scheme of ^{189}Ta ($N=116$) from K-isomer decay - Sharp transition to strong triaxial shapes: Reaching the Prolate-Oblate boundary (submitted to PRL)**
- FRIB PAC3 proposal under review, wider scope, larger team, FDSi, 128×128 Si DSSD, increased sensitivity to longer $t_{1/2}$

THANK YOU!
