Libre Software Meeting

BORDEAUX - JULY 4-8 2001

News

Welcome to the LSM web site!
This site will be updated regularly to keep you informed of the organisation of the Libre Software Meeting, issue 2002.

Many photographs and links in the [LIVE](#) section

LSM 2003 will be held in Metz!

The ABUL [1] voted during its general assembly of December 20th, 2002 the cancellation of the 2003 edition of the Libre Software Meeting [2] and the creation of a driving committee to better prepare the 2004 edition of this event.

However, a group of dedicated volunteers proposed to organise the 2003 edition in Metz (Moselle, east of France), with the help of belgian, germans and inhabitants of Luxembourg. Please refer to <http://libresoftwaremeeting.org>, the official site of the Libre Software Meeting, for more information.

Code Staging in GNU Guix

Ludovic Courtès
Inria
Bordeaux, France

Abstract

GNU Guix is a “functional” package manager that builds upon earlier work on Nix. Guix implements high-level abstractions such as packages and operating system services as domain-specific languages (DSLs) embedded in Scheme. It also implements build actions and operating system orchestration in Scheme. This leads to a multi-tier programming environment where embedded code snippets are staged for eventual execution.

means that software build processes are considered as pure functions: given a set of inputs (compiler, libraries, build scripts, and so on), a package’s build function is assumed to always produce the same result. Build results are stored in an immutable persistent data structure, the store, implemented as a single directory, `/gnu/store`. Each entry in `/gnu/store` has a file name composed of the hash of all the build inputs used to produce it, followed by a symbolic name. For example, `/gnu/store/yr9rk90jf...gcc-7.1.0` identi-

Building a Secure Software Supply Chain with GNU Guix

Ludovic Courtès^a
^a Inria, France

Abstract The *software supply chain* is becoming a widespread analogy to designate the series of steps taken to go from source code published by developers to executables running on the users’ computers. A security vulnerability in any of these steps puts users at risk, and evidence shows that attacks on the supply chain are becoming more common. The consequences of an attack on the software supply chain can be tragic in a society that relies on many interconnected software systems, and this has led research interest as well as governmental incentives for supply chain security to rise.

logiciel libre = *open source**

<https://www.unesco.org/en/legal-affairs/recommendation-open-science>

7. **Les connaissances scientifiques ouvertes** désignent le libre accès aux publications scientifiques, aux données de recherche, aux métadonnées, aux ressources éducatives libres, aux logiciels, et aux codes sources et aux matériels relevant du domaine public ou alors protégés par le droit d'auteur, et publiés sous une licence ouverte permettant leur consultation, leur réutilisation, leur utilisation à d'autres fins, leur adaptation et leur distribution dans des conditions spécifiques, dont tous les acteurs bénéficient de manière immédiate, ou bien aussi rapidement que possible – quel que soit leur lieu de résidence, leur nationalité, leur race, leur âge, leur genre, leur niveau de revenu, leur situation socioéconomique, le stade de leur vie professionnelle, leur discipline, leur langue, leur religion, leur handicap, leur appartenance ethnique, leur statut migratoire, ou tout autre motif – et gratuitement. Elles font également référence à la possibilité d'une ouverture des méthodologies de recherche et des processus d'évaluation. Les utilisateurs se voient ainsi accorder un libre accès :

Understanding Toxicity in Open Source Discussions

Courtney Miller, Sophie Cohen, Daniel Klug, Bogdan Vasilescu, Christian Kästner
 Carnegie Mellon University  Wesleyan University
`{courtneymiller, dklug, vasilescu}@cmu.edu`

ABSTRACT

Online toxicity is ubiquitous across the internet and its negative impact on the people and that online communities that it effects has been well documented. However, toxicity manifests differently on various platforms and toxicity in open source communities, while frequently discussed, is not well understood. We take a first stride at understanding the characteristics of open source toxicity to better inform future work on designing effective intervention and detection methods. To this end, we curate a sample of 100 toxic GitHub issue discussions combining multiple search and sampling strategies. We then qualitatively analyze the sample to gain an

volunteering their time, talk openly about how sometimes interactions with others in open source can be toxic, rude, mean, or unkind [e.g., 3, 24, 44, 54, 108]. Toxicity, defined here as “rude, disrespectful, or unreasonable language that is likely to make someone leave a discussion”¹ is a huge problem online [26]. Virtually all online platforms recognize the threat that toxicity, or the various types of behavior under its umbrella, poses on the health and safety of online communities. As a result, a number of prevention and mitigation policies and interventions have been proposed, including codes of conduct, moderation, counterspeech, shadow banning, or just-in-time guidance to authors.

deleted for]. Especially criticism [33].

a hostile or elitist place, especially newer coders, women, people of color, and others in marginalized groups” [41].

the moderation of new users has been shown to have a positive effect on the quality of interactions [33].

fensive language, and are exposed to other types of toxic behavior. In addition, arrogant commenters and arrogant tool users have unreactive attitudes towards writing toxic comments.

Prior work: Open-source contributors deciding whether to work on a project consider the friendliness of project correspondence [76]. Some newcomers disengage due to negative interactions [94]. Some maintainers report stress and burnout [79]. *Our results:* Maintainers often invest substantial time to respond to toxic comments.

Prior work: Previous work has shown that automated tools can detect toxicity in text, but no automated tool has been able to detect toxicity in code [10]. *Our results:* We found that maintainers frequently encounter toxicity in our projects’ issues as they are opened, closed, and commented on.

1. se sentir **bienvenu·e et respecté·e**
2. trouver **sa place** dans le collectif
3. comprendre la **prise de décision** et y participer
