

Towards Next Day Analysis

ASTRAN (LAPP-ANA triggered by email)

LAPP-ana updates

- Merged allSkyMC branch (Estelle’s work) to main branch.
- Left allSkyMC branch in the repo for provenance

| Active branches | | | | |

LAPP-ana updates

- Fixed some bugs
- **Implemented lapp-ana as a python package**
- (Implies a big change in code structure.)
 - git clone & pip install -e ./
 - Versioning (full track and ensure compatibility with Istchain) follows Istchain versioning (eg. currently implemented 0.10.4).
 - Call scripts for dl2, dl3 production instead of setting \$CODE_DIR variable. Expose dl2,dl3 production functions so that they can be called inside python.

```

ASTRAN: Advanced System for Telescope Results and Analysis of the Night NOVANA: Night Observation Verification and Analysis System

Introducing ASTRAN: Tailored for the LST at CTA, this system streamlines the analysis of night-sky observations. Launch ASTRAN conveniently from your email by providing analysis parameters, and benefit from its efficiency in handling telescope results. Enjoy the added convenience of next-day analysis, receiving a concise summary of results promptly after the completion of cosmic exploration. It's advanced high-level analysis made accessible. 🌌🌟

Setup

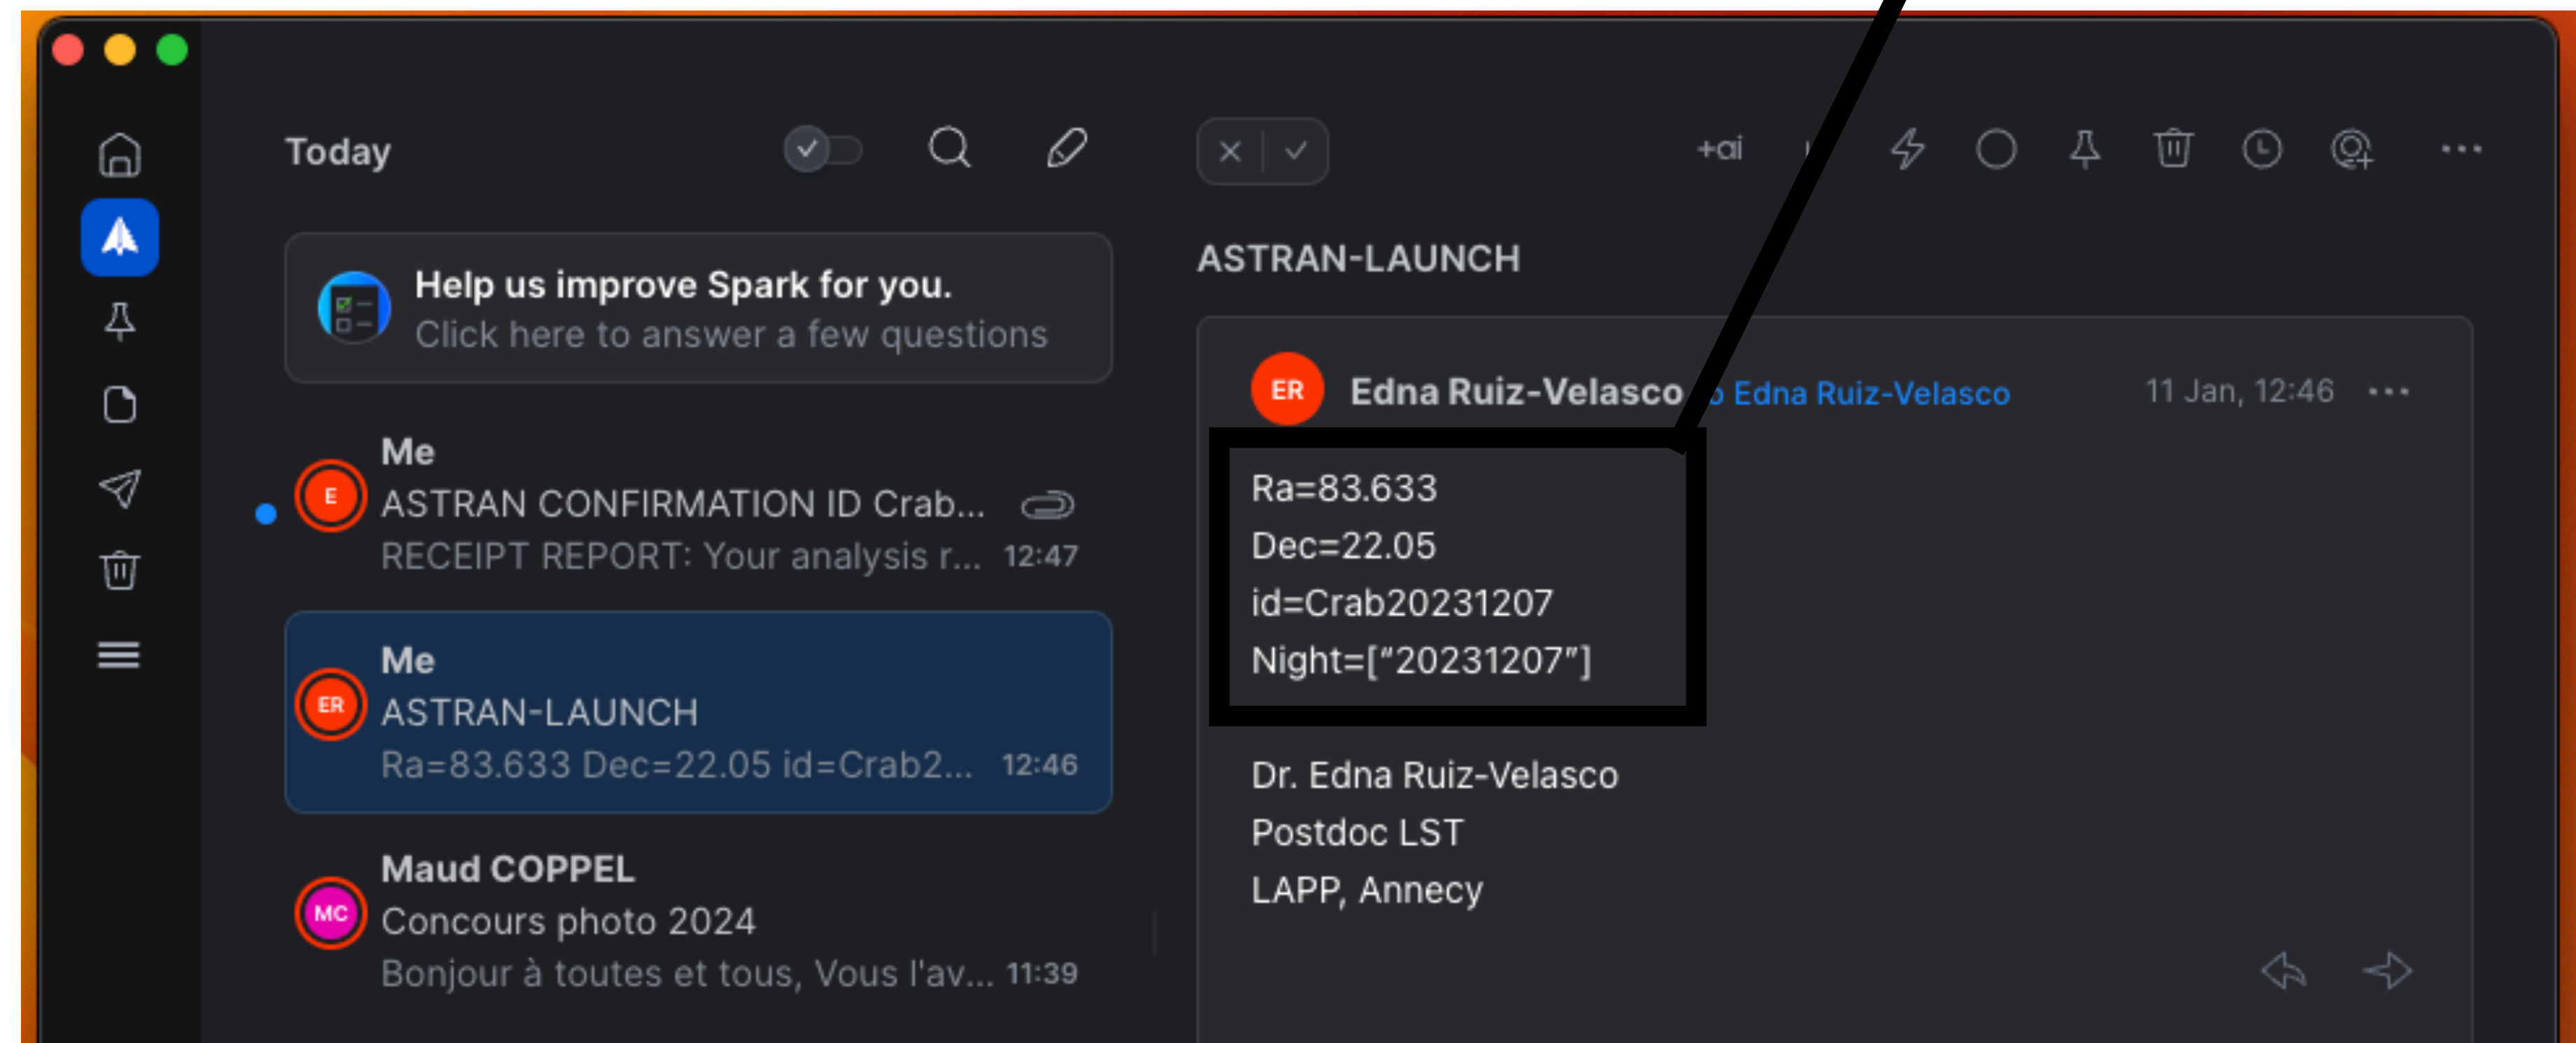

ASTRAN executables:

Astran-launcher: (will be running as a cronjob every minute), listens to email inbox via IMAP and looks for email subject "ASTRAN-LAUNCH".

Steps

Send launcher email

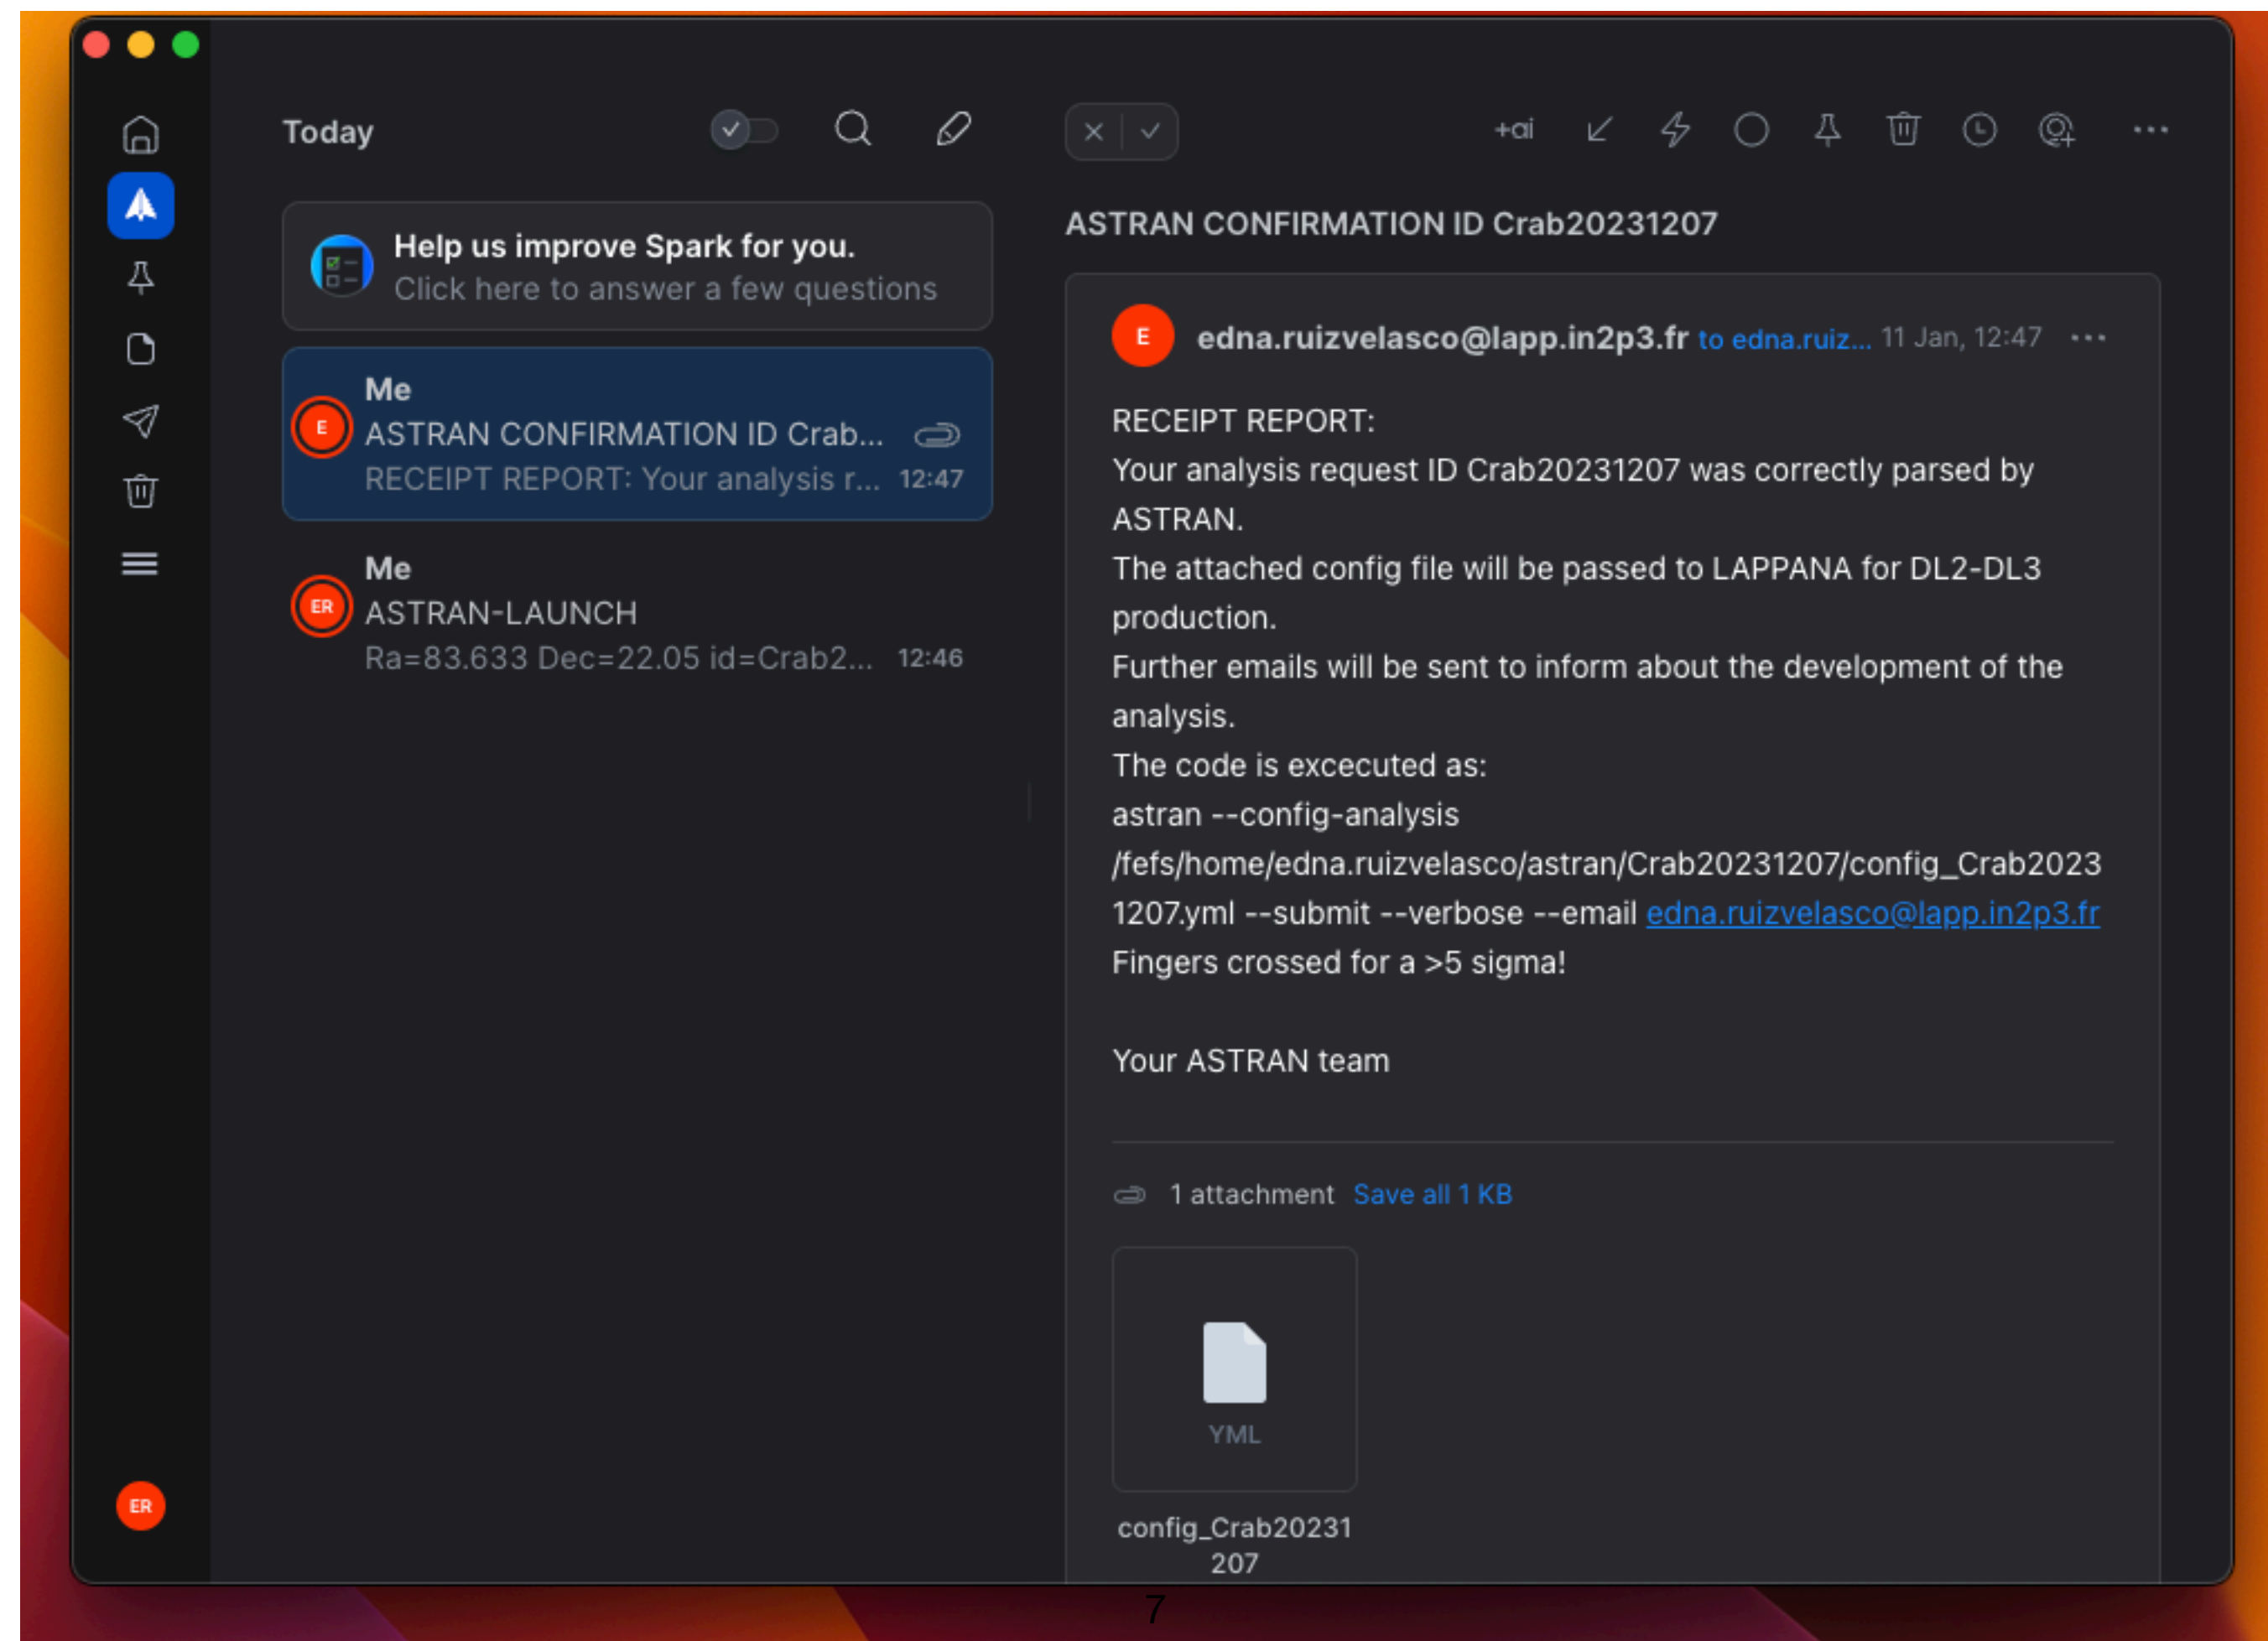

Not configured,

But in principle any parameter of lappana could be passed here.

(In favor to keeping it simple to reduce user-induced errors)

Steps

**astran-launcher (cronjob) finds a new email with the keyword.
Execution stats and confirmation email is received**

Steps

`astran --config-analysis /fefs/home/edna.ruizvelasco/astran/Crab20231207/config_Crab20231207.yml --submit --verbose --email edna.ruizvelasco@lapp.in2p3.fr`

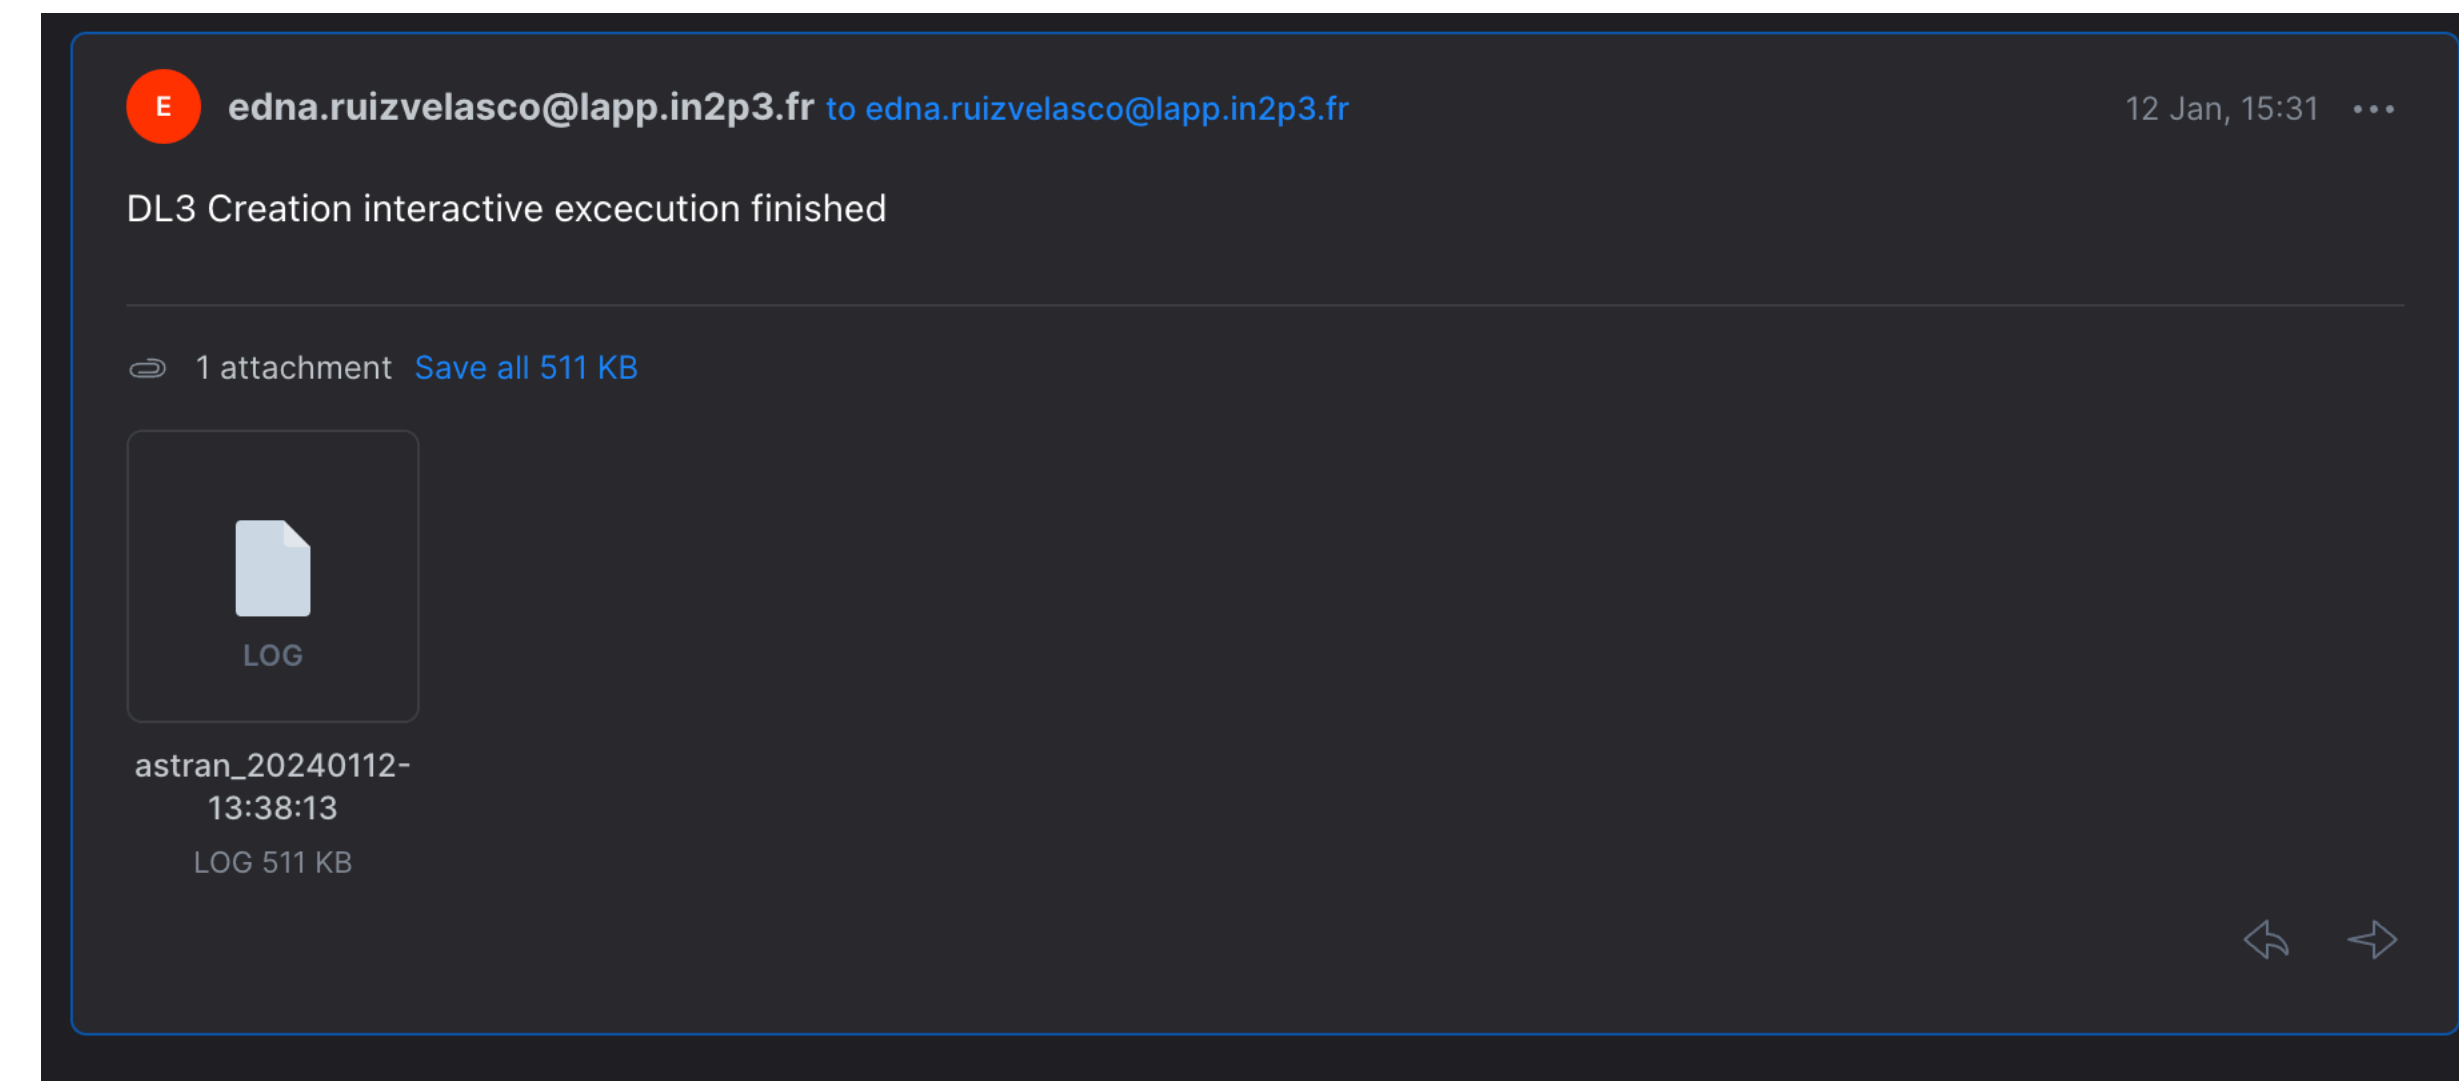

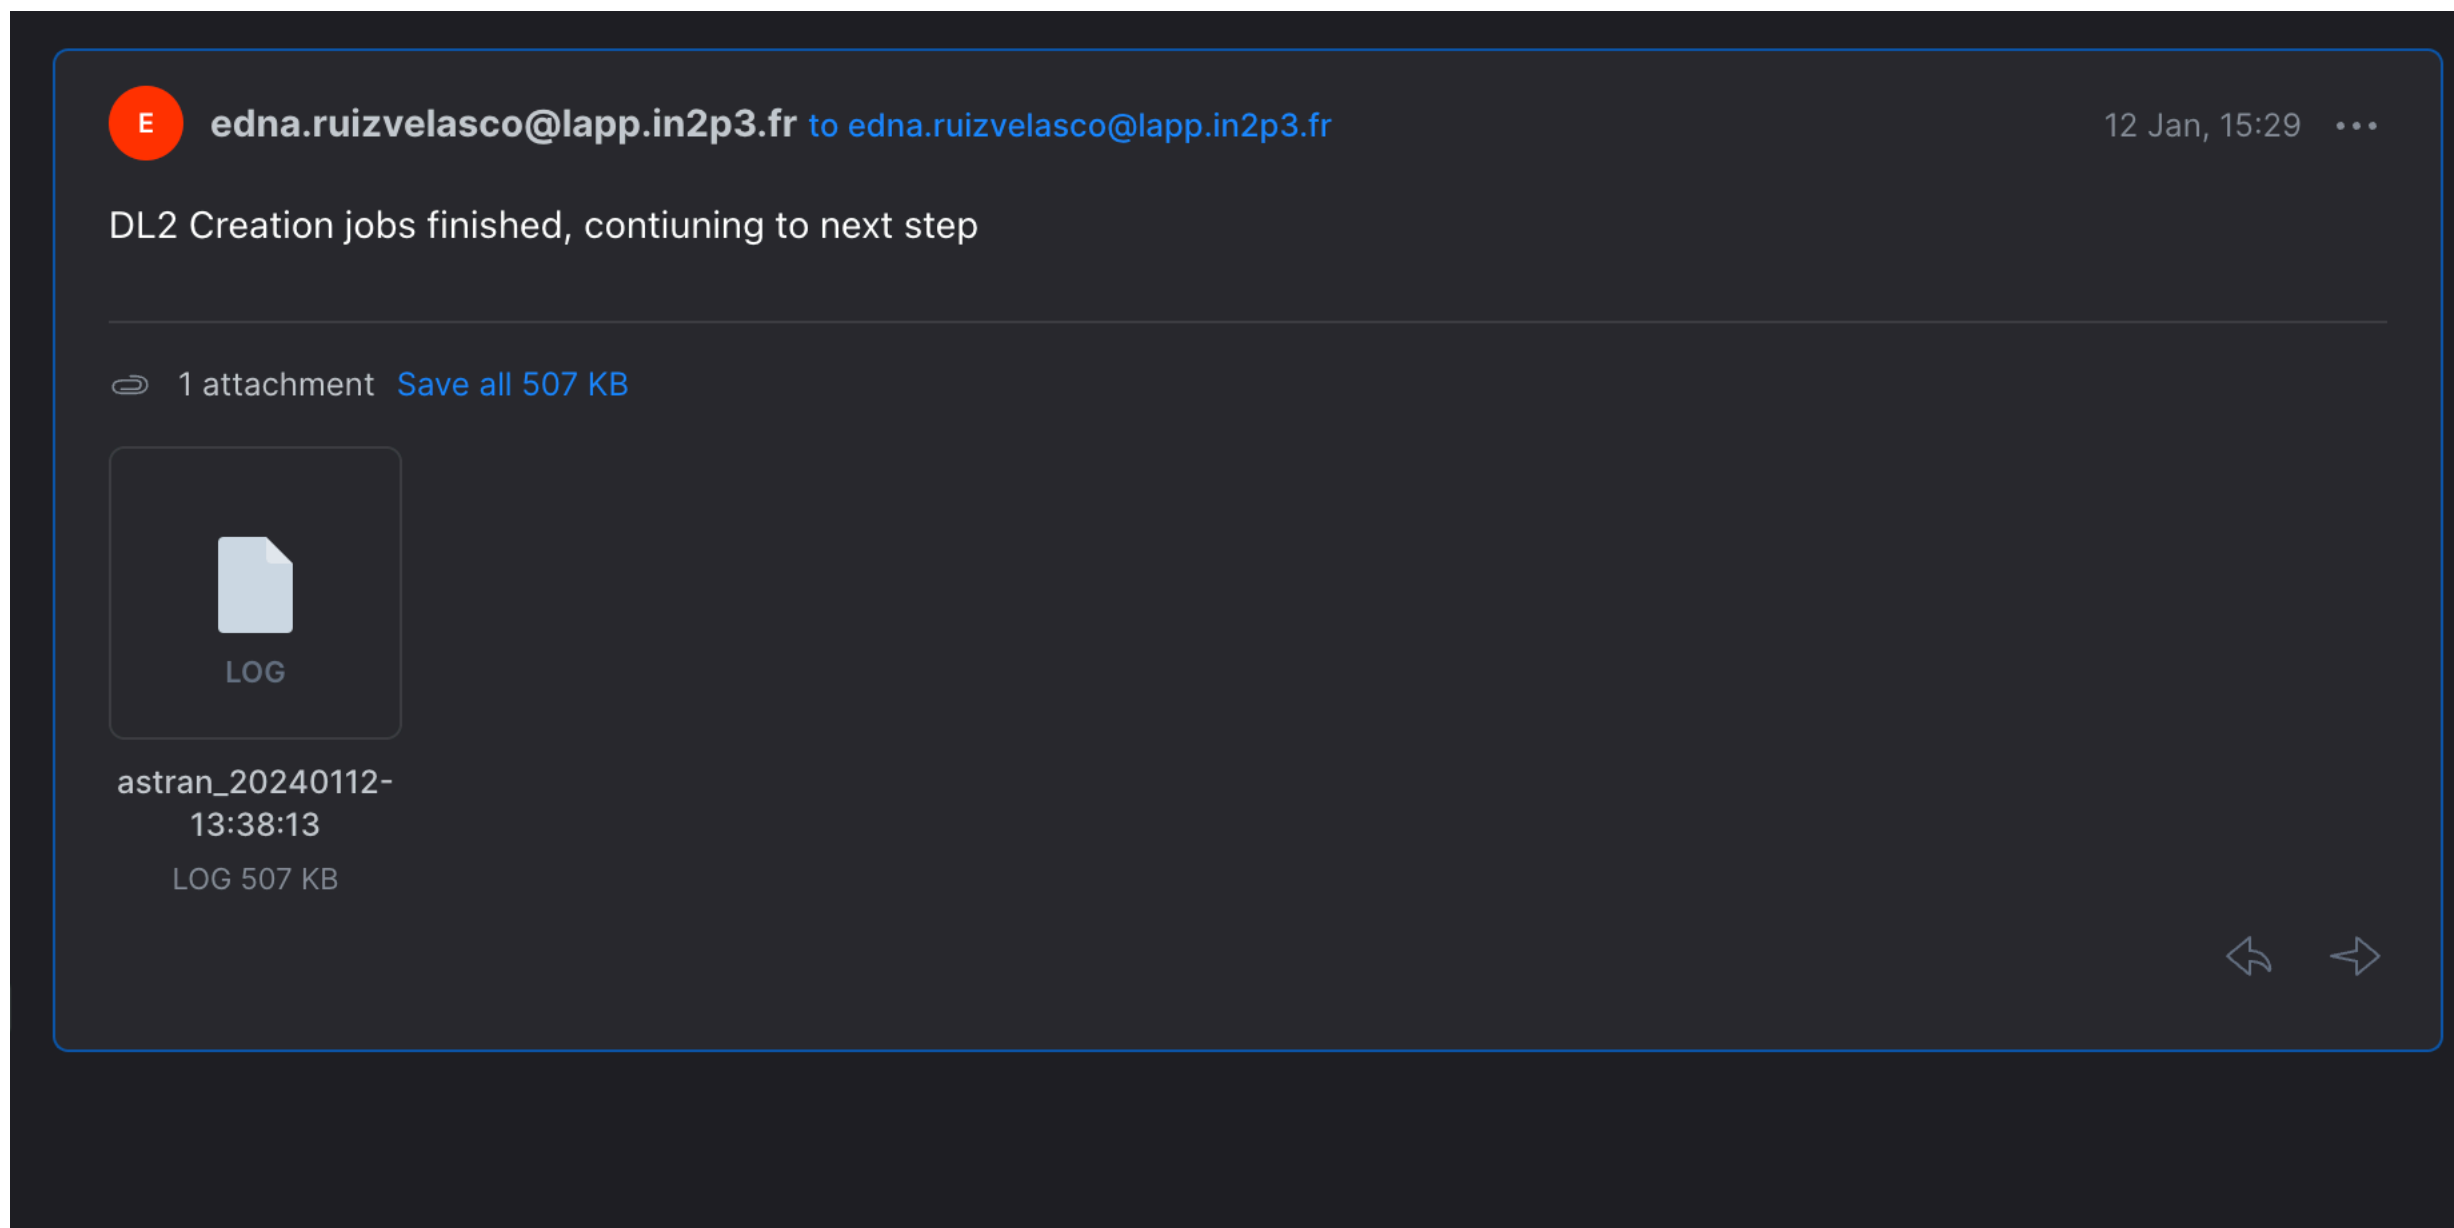

- Execution begins. DL2 production submission to slurm and once finished DL3 production in interactive mode

```

Steps

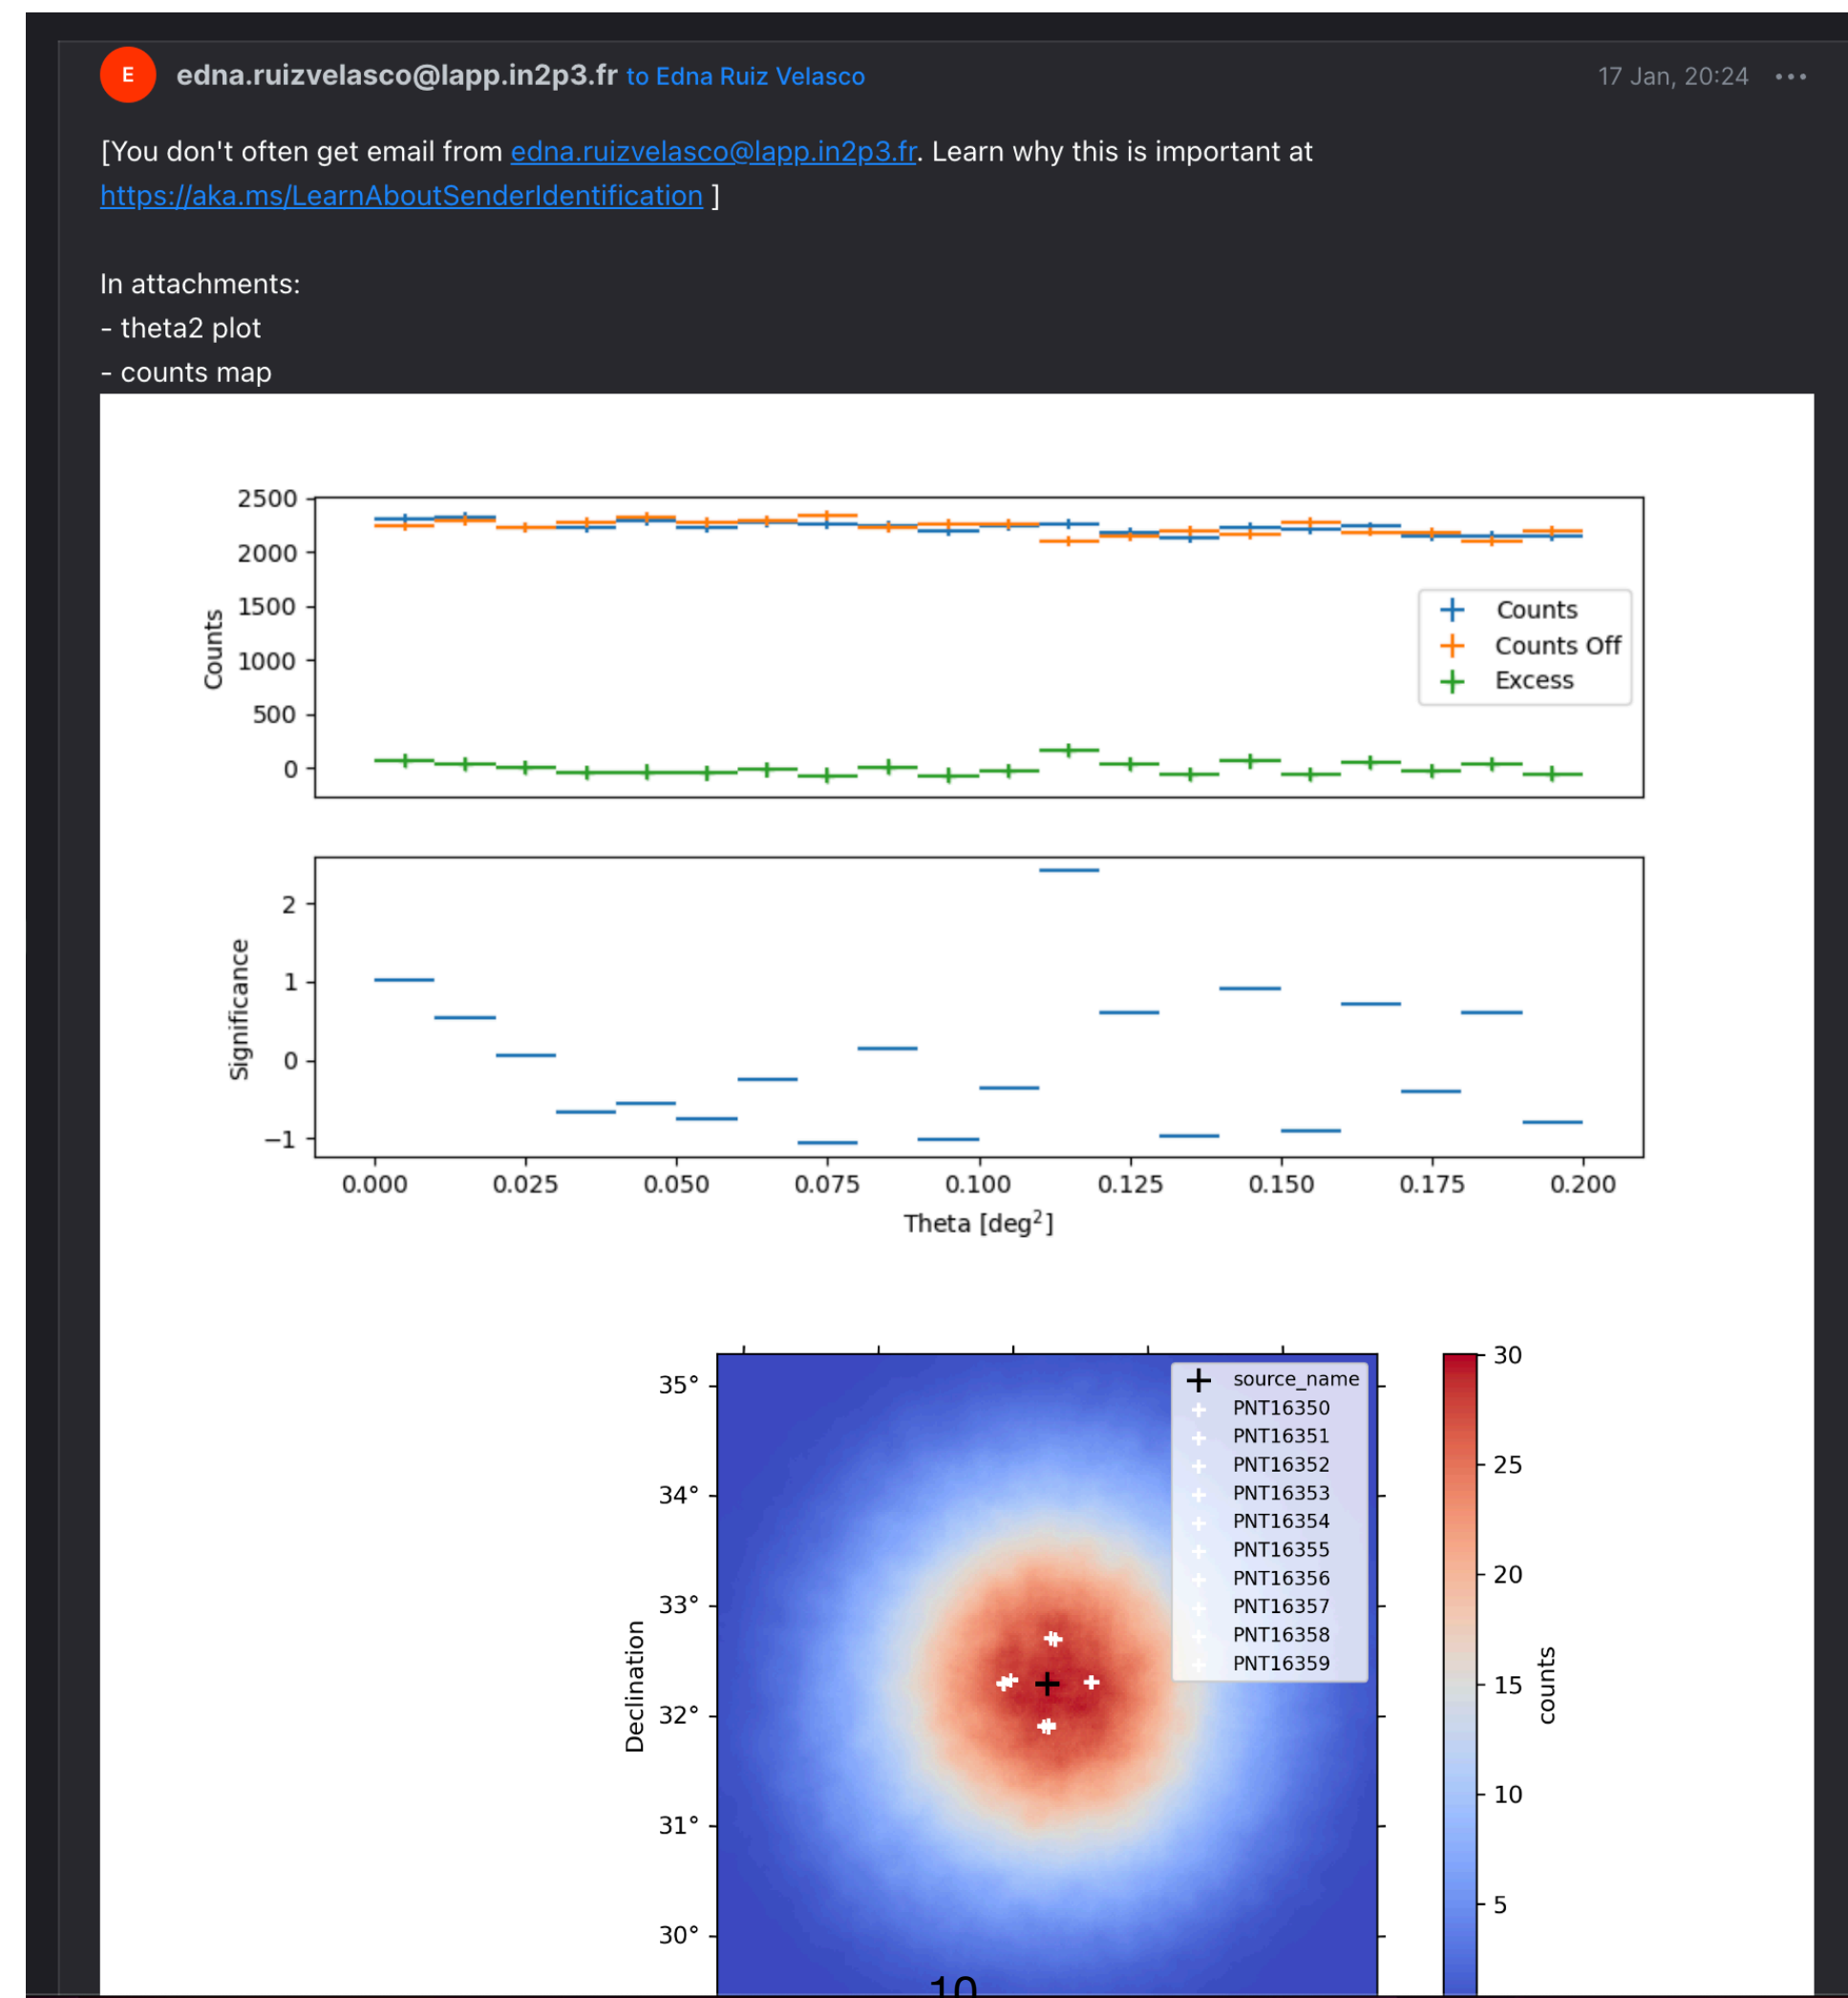

Email reports:

-include log files to look into details about processing

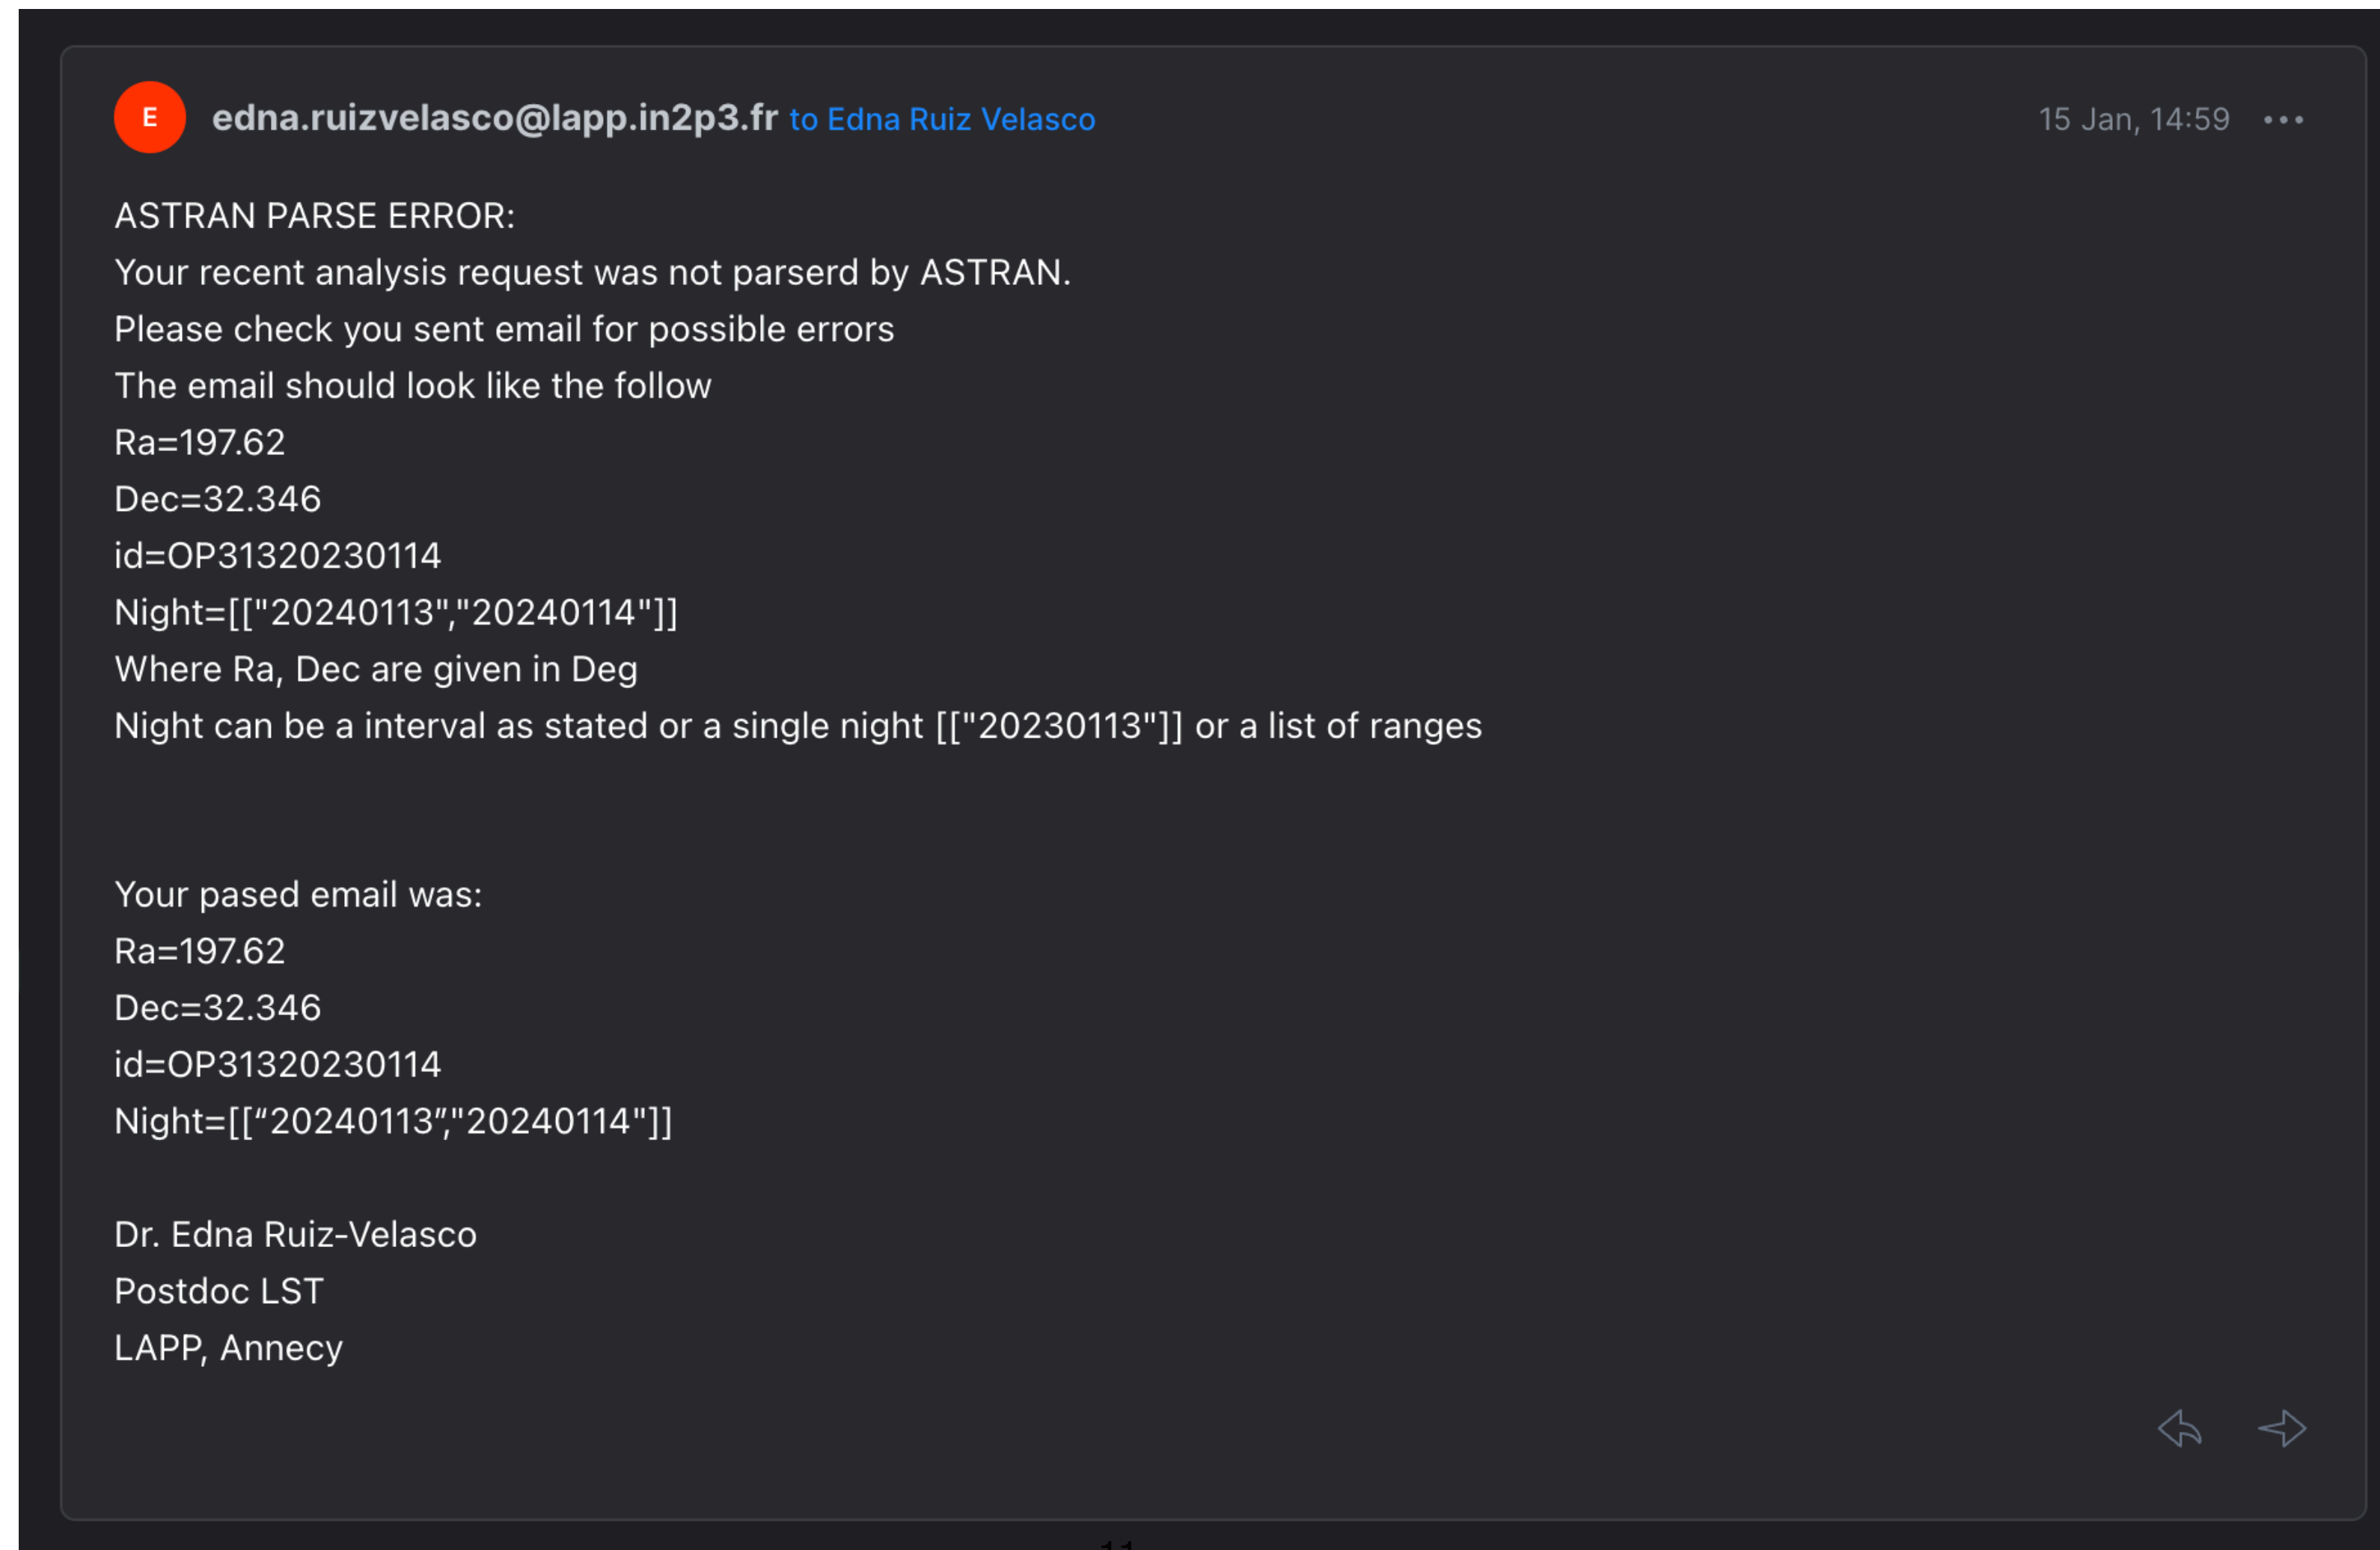

Next steps (ongoing)

Once DL3 finishes, obtain high-level plots (skymap, theta2, diagnostics —>recycle RTA scripts for this)

What if...

Your email has a typo, or you forgot the syntax

Current incognitos

Resources distributions:

- Two approaches:
 - a) user-dependant: each interested person installs and configures astral (git clone, conda envs and IMAP configuration) and submits to their slurm share.
 - b) somehow get a “shared” account (email and cluster user) where people can submit their ASTRAN requests through the email trigger.

Unification (?)

- In principle ASTRAN can be put as a sub-package of lappana since it depends on lappana but their usage/philosophy is quite different
- RTA high-level routines (skymap productions, run diagnostics etc) which will become also versioned hand to hand with ASTRAN & lappana & Istchain.
- -> to Istchain <- but really not needed+political stuff (just saying).

Caveats -> To do's

- No idea what will happen if DL1 does not exist. (Future improvement is to check if DL1 are there and if not wait)
- Send ASTRAN-LAUNCH from gmail will activate the launching but you will not receive any confirmation email (authentication issues).
- There are some instance errors that won't be reported to the user via email.
- As lappana, it requires constant maintenance to keep up with Istchain version changes.
