

***Temporal organization of large earthquakes  
along the Altyn Tagh Fault, China***

**Nicolás Pinzón M.**

## How do earthquakes accommodate deformation along strike-slip faults?

No instrumental earthquakes.

No historical records about major events.

Paleoseismic history still poorly known. Then, there is no clear pattern of rupture repetition.

### Paleoseismicity along the eastern Altyn Tagh Fault (ATF)

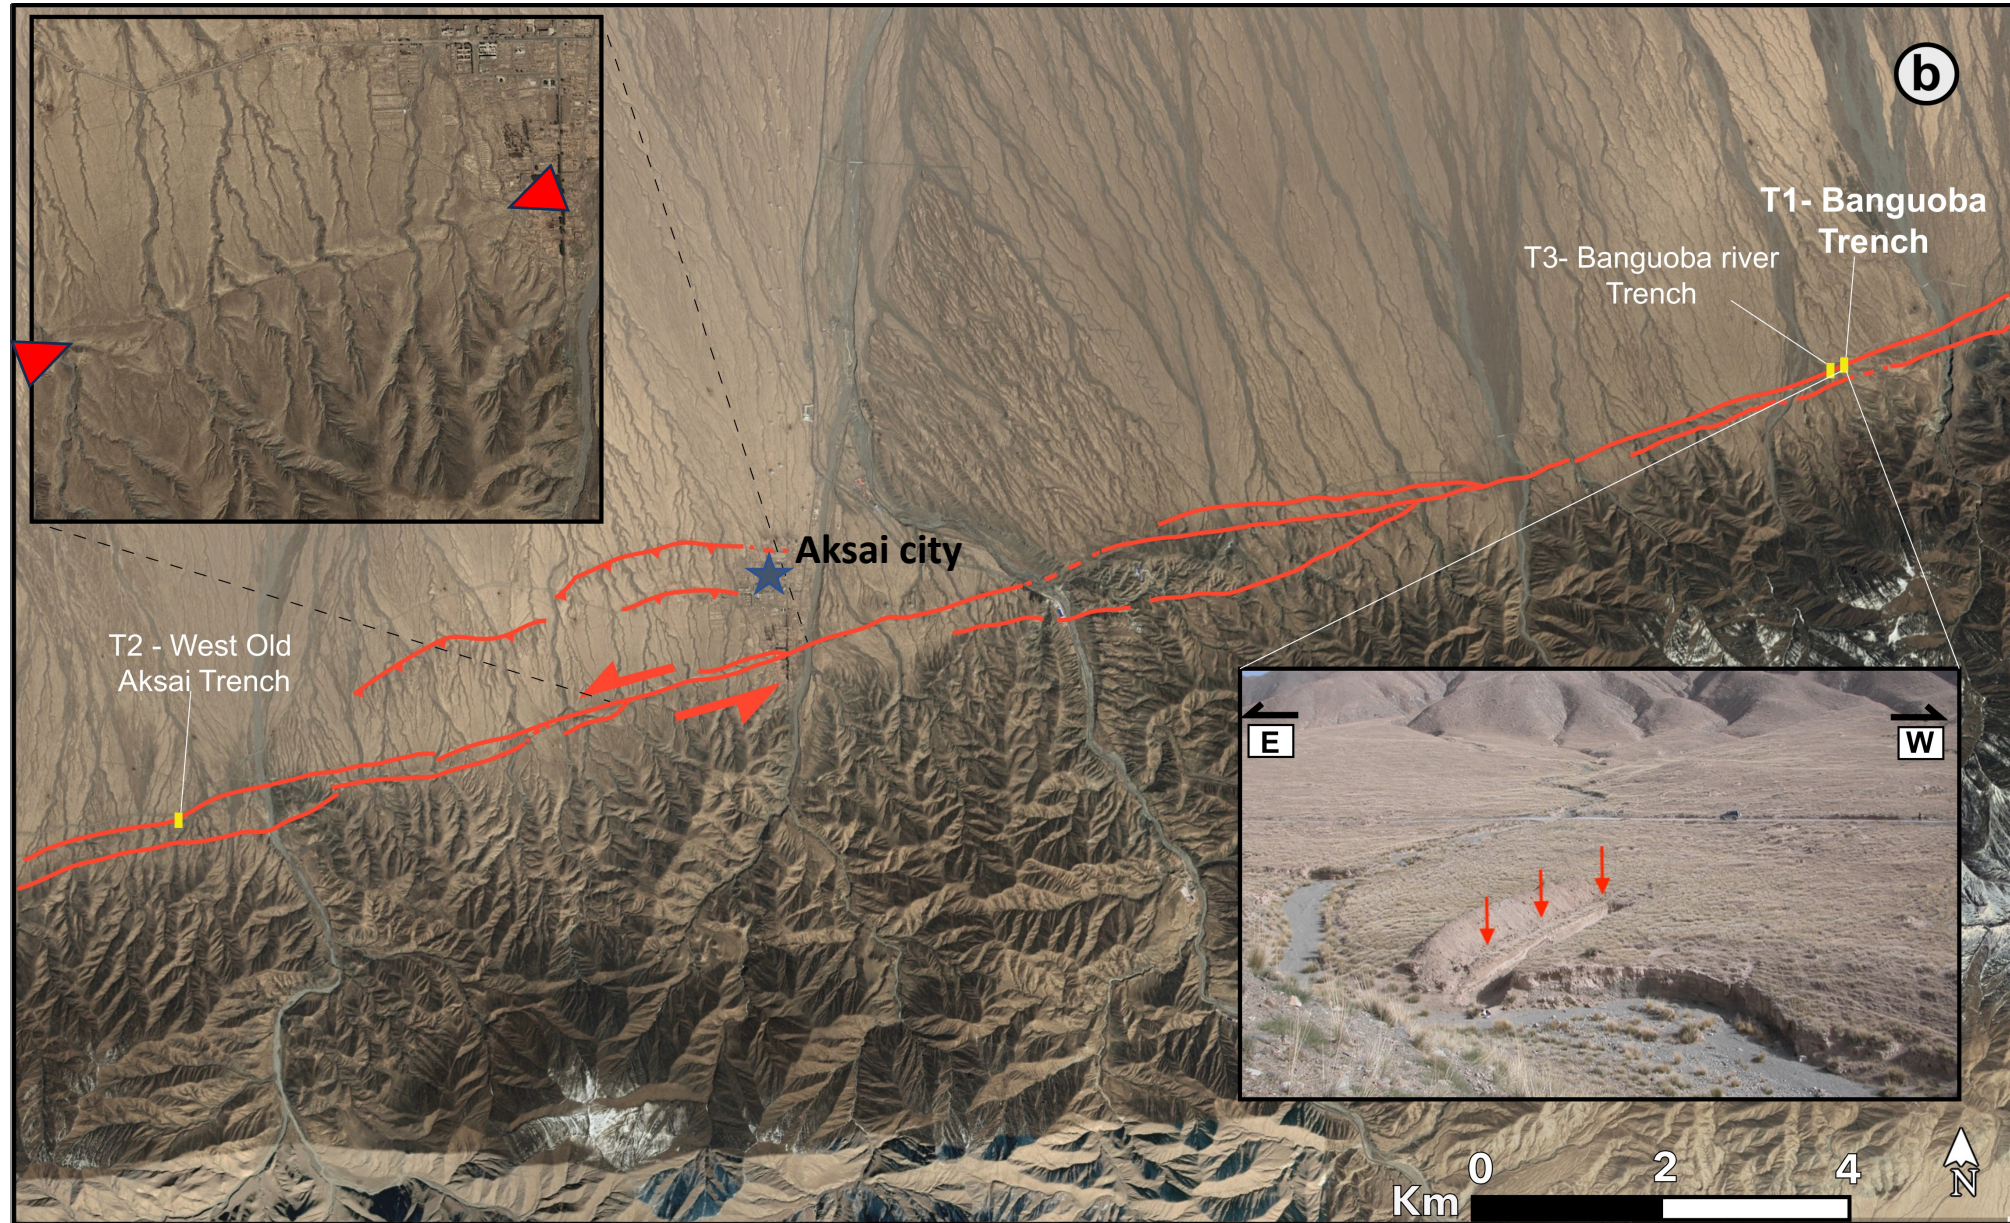

**Fault topography far from being obvious and ubiquitous loess layer**

- The average recurrence interval for the northern ATF is  $\sim 1371 \pm 600$  yr.
- the recurrence behavior of each fault segment of the ATF is rather periodic than random (COV  $\sim 0.46$ )

Summary of the Paleoseismic data

Lower return intervals

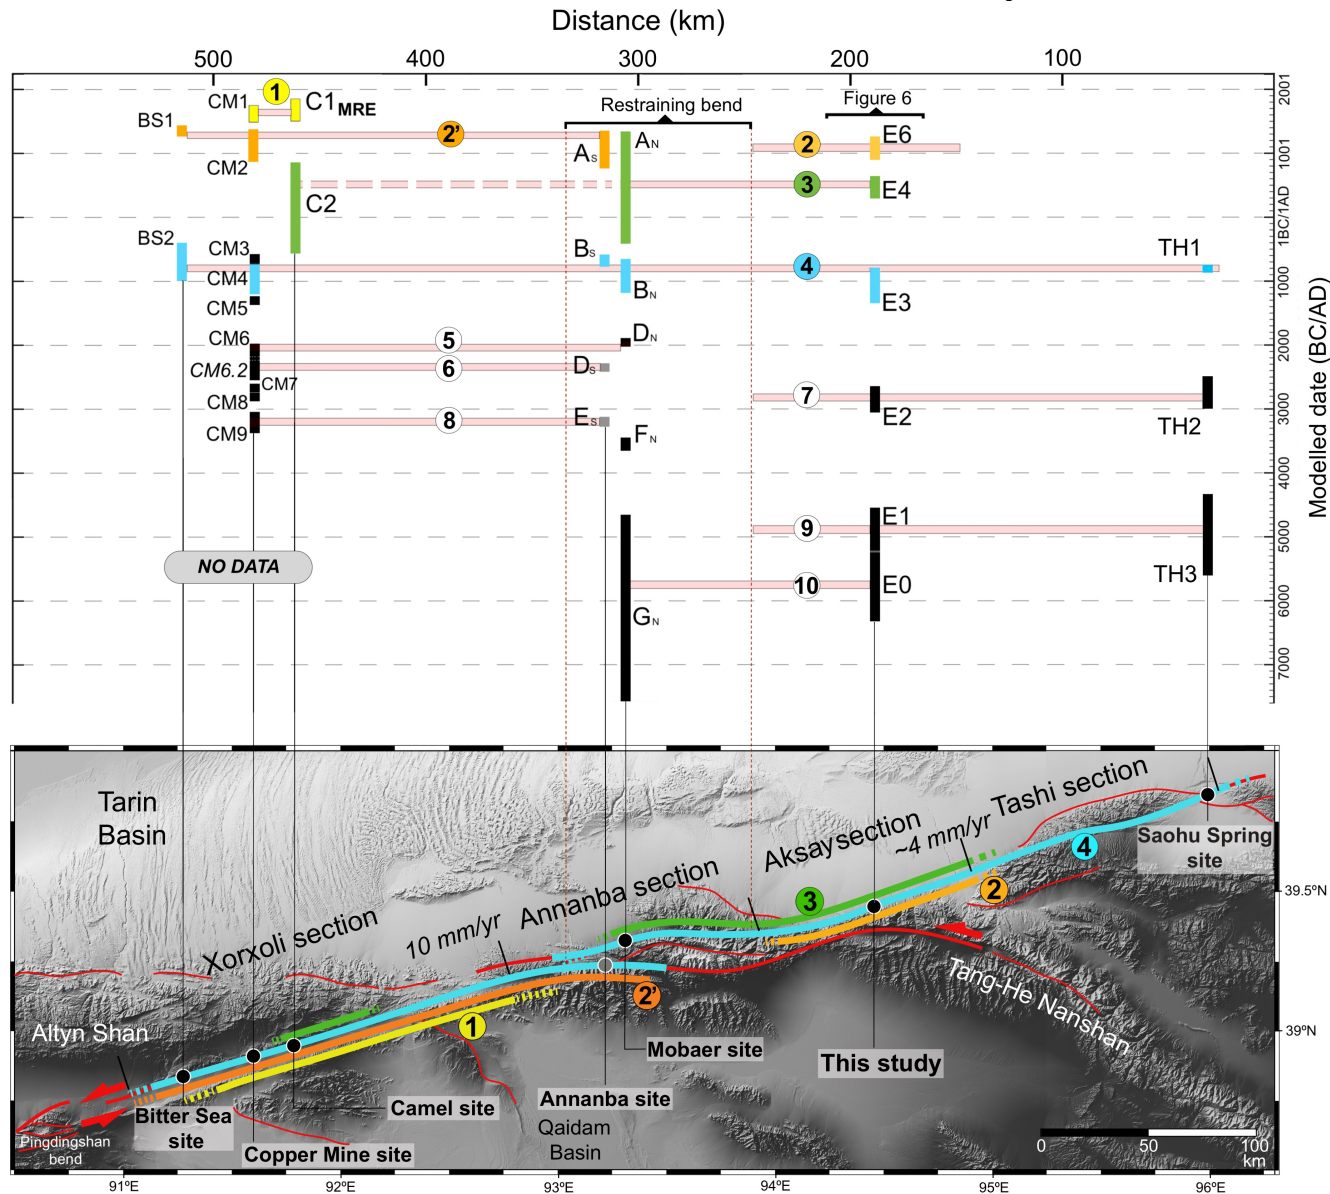

Higher COV - starting to deviate from a periodic behavior

Higher return intervals

Lower COV – strongly periodic behavior

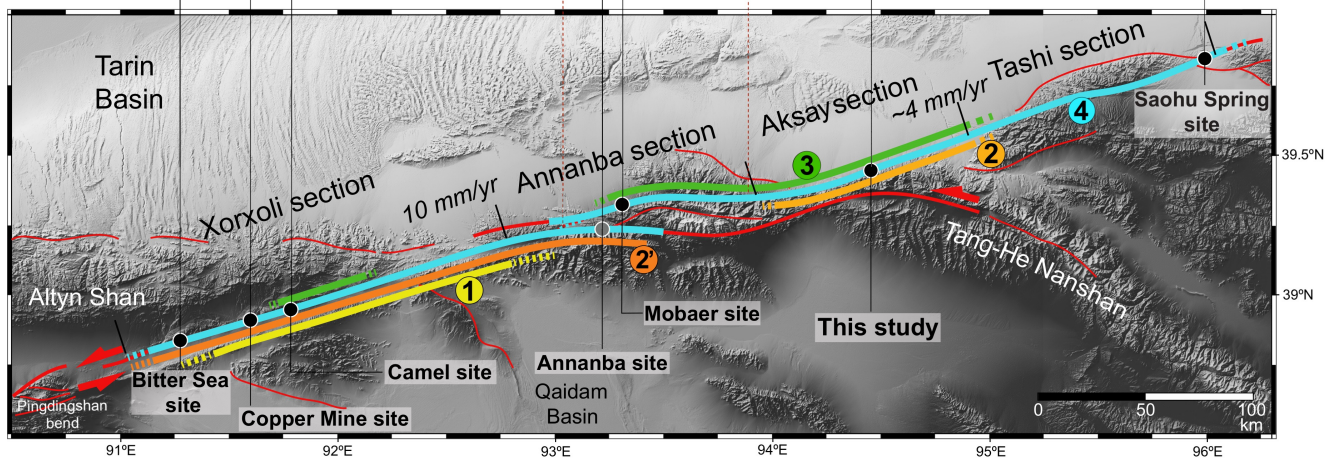

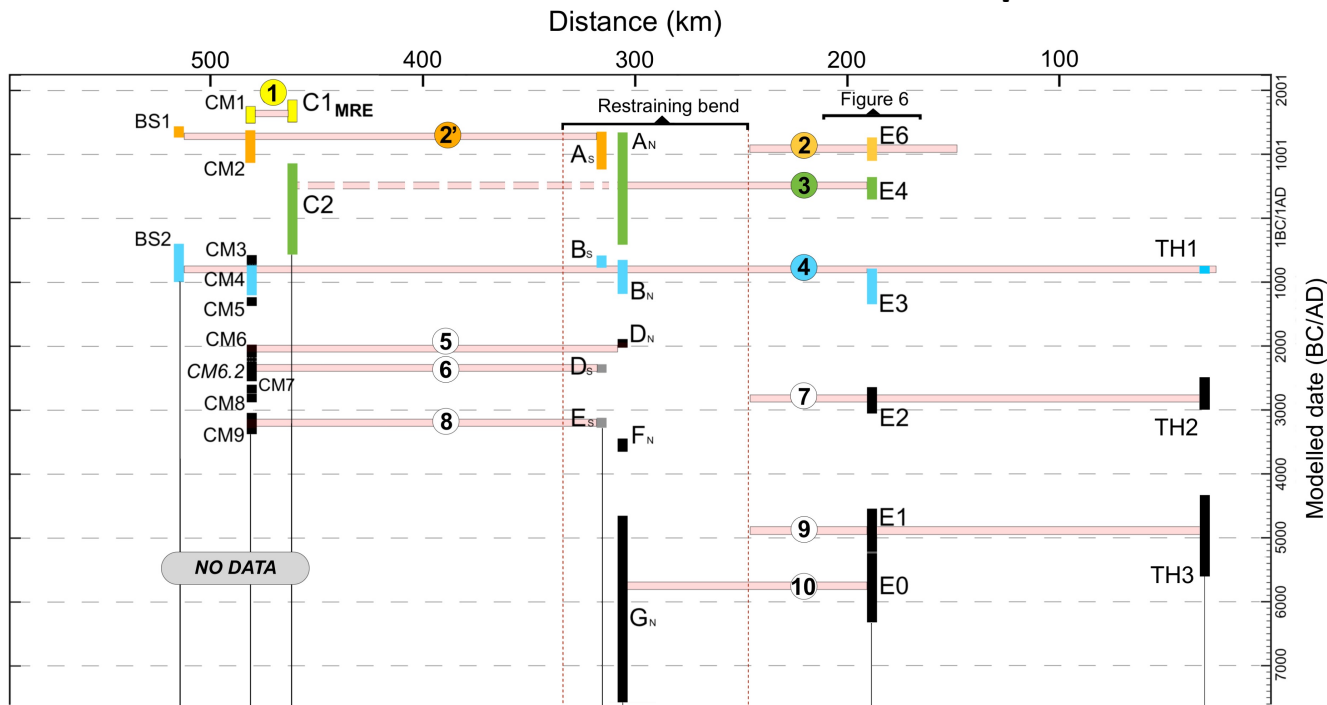

Rupture Pool at a Regional Scale

Rupture Pool at a Regional Scale

Compare and Correlate earthquake PDFs

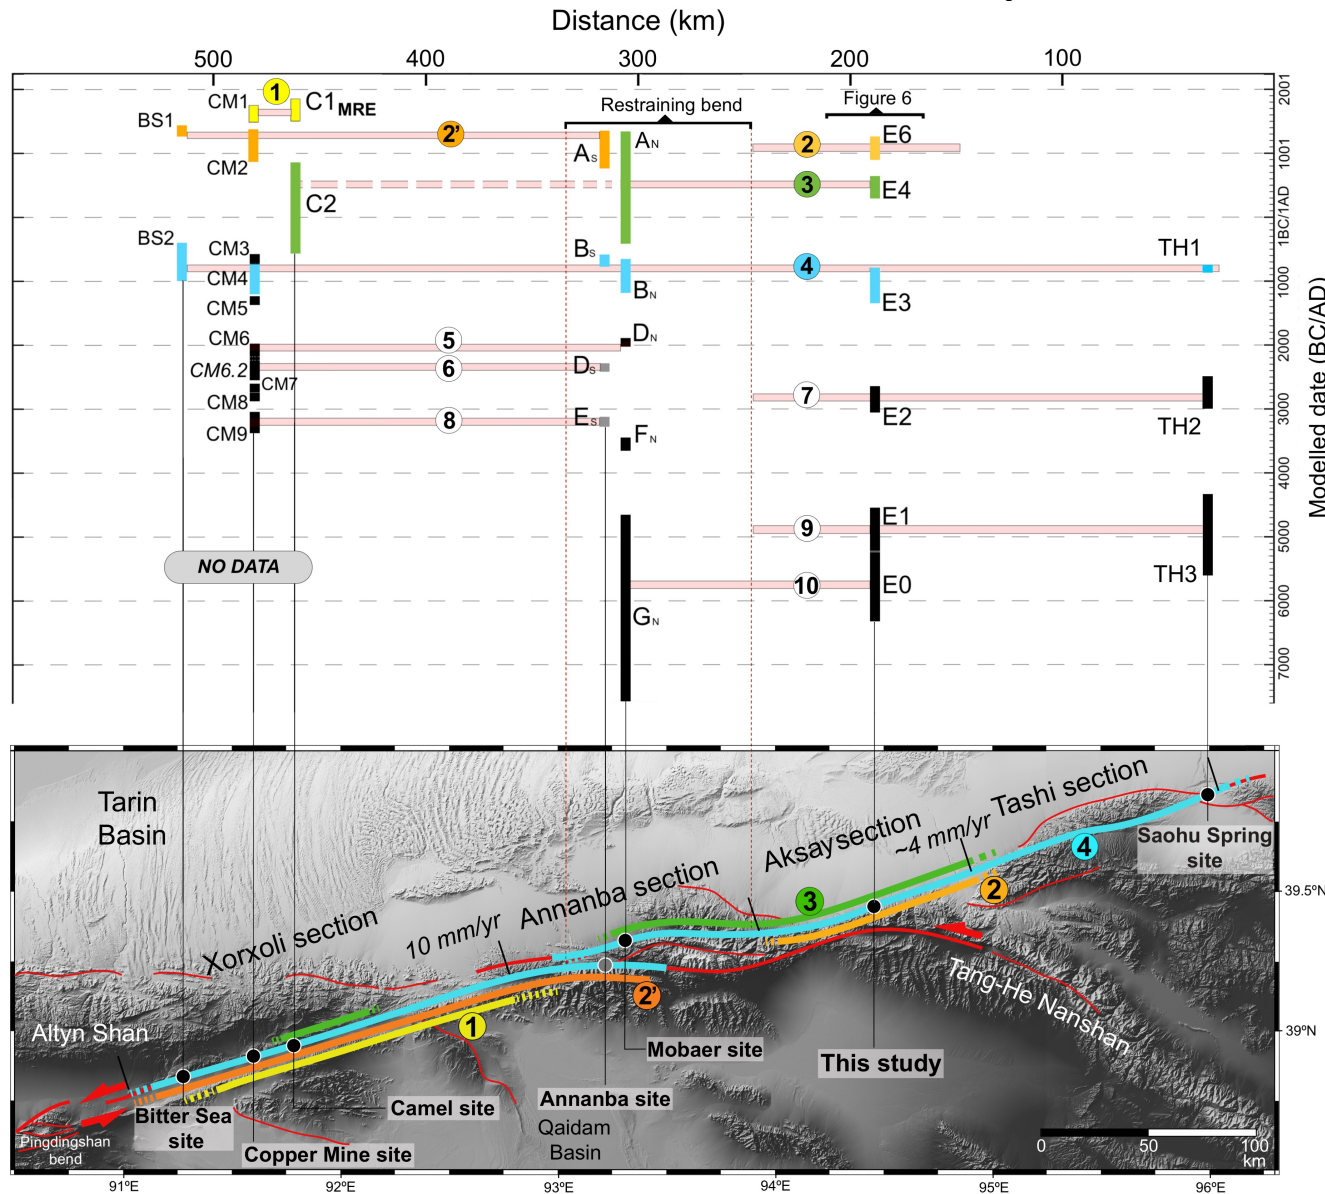

$$\text{overlap area}(i, j) = \sum \min[pyr_i(\tau), pyr_j(\tau)], \quad (1)$$

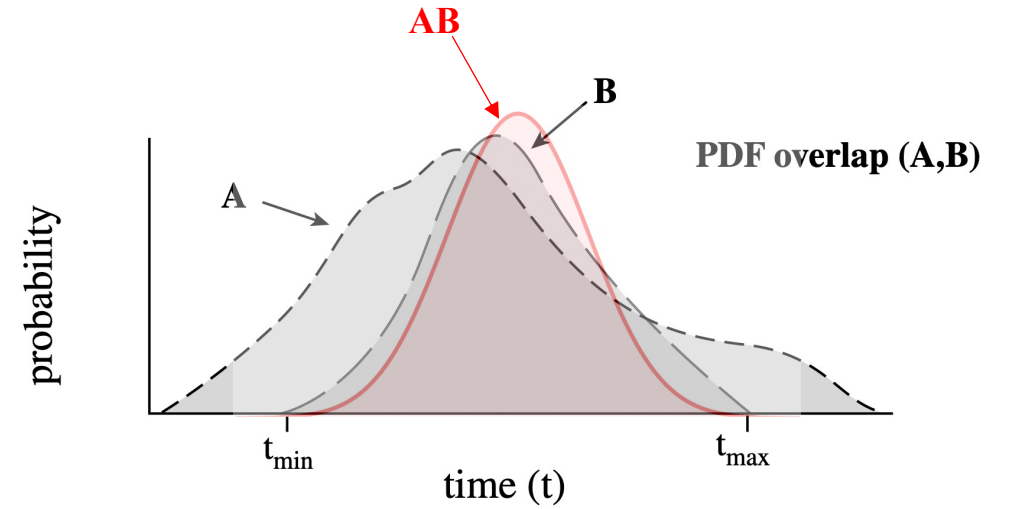

Minimum overlap criteria ( $\chi^2$ ) = 0.09

$$\text{overlap area}(i, j) = \sum \min[pyr_i(\tau), pyr_j(\tau)], \quad (1)$$

Minimum overlap criteria ( $\chi^2$ ) = 0.09

Although at a local scale, the fault shows independent quasi-periodic rupture behaviors, **at a regional scale these large events exhibit a temporal cluster organization.**

These clusters present interevent times of  **$475 \pm 108$  yr** and are preceded by long-lull periods of  **$1393 \pm 230$** .

These clusters present interevent times of  **$475 \pm 108$  yr** and are preceded by long-lull periods of  **$1393 \pm 230$** .

**Eastern ATF** - either at the early stage of a seismic quiescence period or at the late stage of a cluster period.

4 m slip-deficit (10 mm/yr) compatible with a minimum magnitude of  **$M_w 7.3$** .

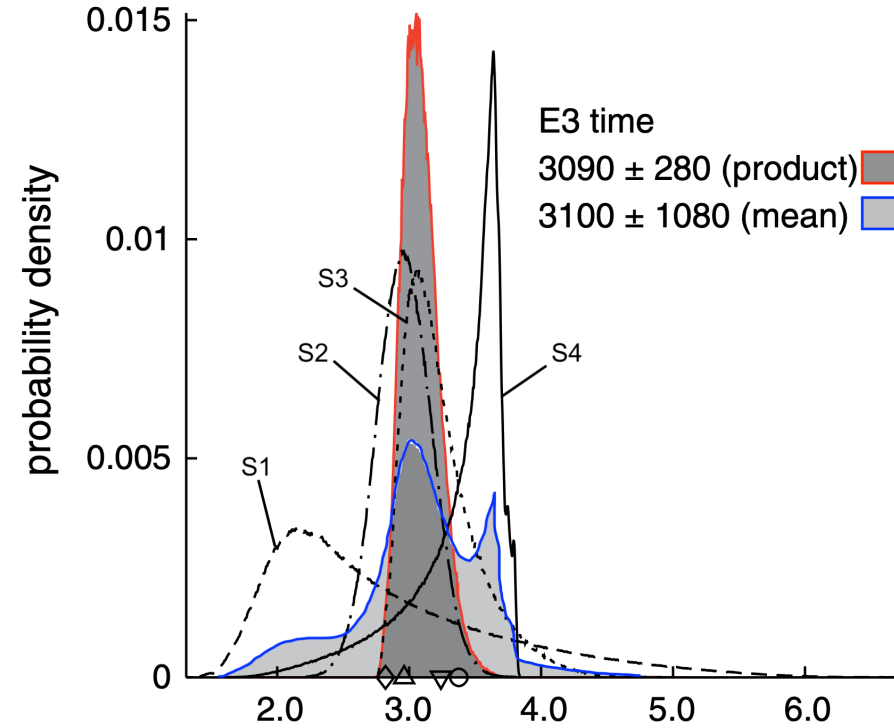

How to combine paleoseismic data?

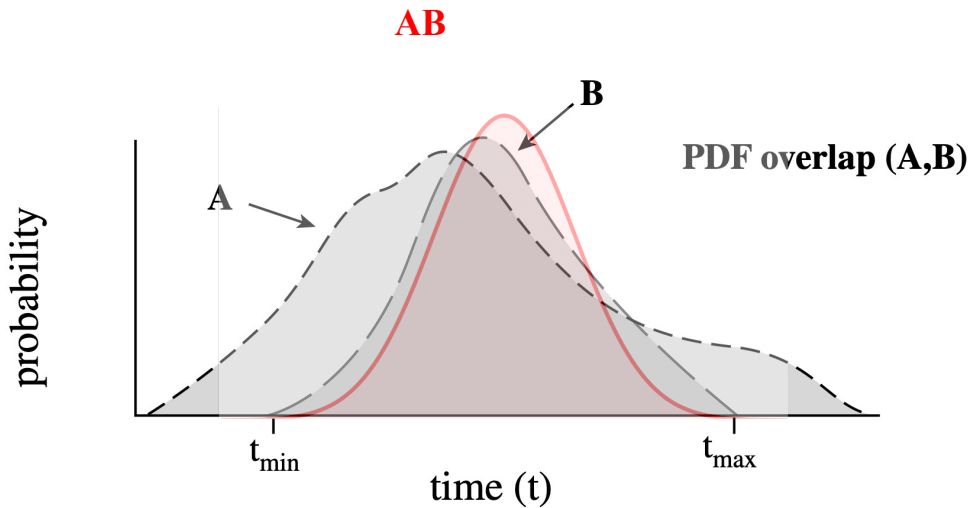

How to combine paleoseismic data?

Mean-rupture Method  
(Biasi et al., 2009)

Product-rupture Method  
(DuRoss et al., 2011)

How to combine paleoseismic data?

Mean-rupture Method  
(Biasi et al., 2009)

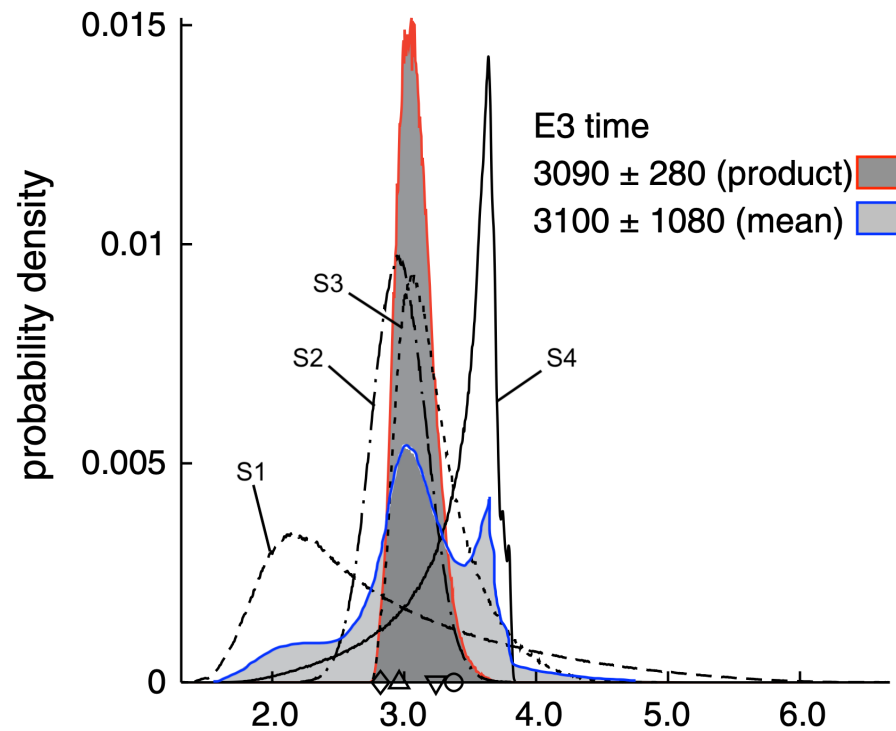

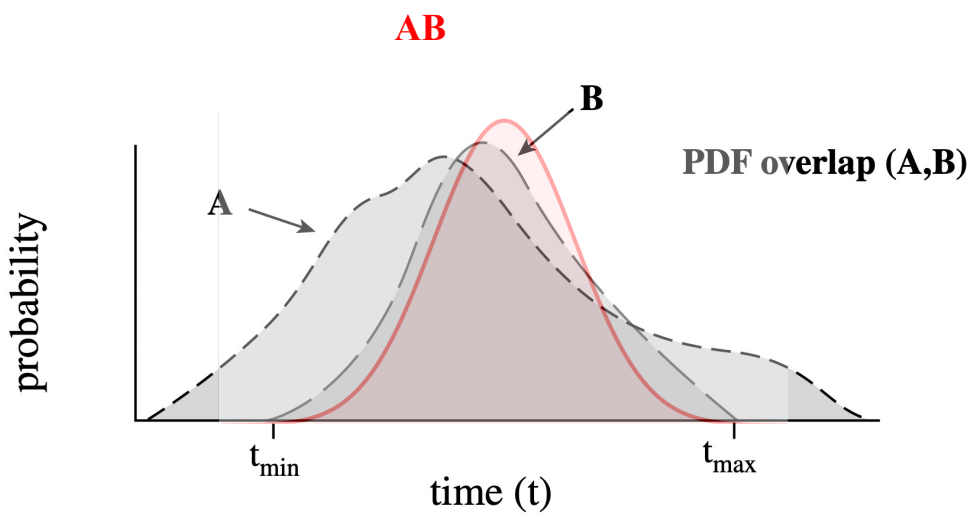

- Large uncertainties
- Theoretically correct

Product-rupture Method  
(DuRoss et al., 2011)

- Smaller uncertainties
- Abrupt reduction of the probabilities to zero.
- Lack of theoretical foundations from a mathematical perspective.

How to combine paleoseismic data?

Mean-rupture Method  
(Biasi et al., 2009)

- Large uncertainties
- Theoretically correct

Ok...

Product-rupture Method  
(DuRoss et al., 2011)

- Smaller uncertainties **but at what cost?**
- Abrupt reduction of the probabilities to zero.
- Lack of theoretical foundations from a mathematical perspective.

Hmm...

How to combine paleoseismic data?

Looking for a method that yields better-constrained ages and is consistent with the earthquake rupture assumptions and the probability theory.

Mean-rupture Method  
(Biasi et al., 2009)

- Large uncertainties
- Theoretically correct

Ok...

Product-rupture Method  
(DuRoss et al., 2011)

- Smaller uncertainties **but at what cost?**
- Abrupt reduction of the probabilities to zero.
- Lack of theoretical foundations from a mathematical perspective.

Hmm...

**Thanks for your attention**
