Recent studies on heavy-flavor femtoscopy in Au+Au collisions by STAR

jeudi 7 novembre 2024 16:20 (25 minutes)

Heavy quarks are produced in hard partonic scatterings at the very early stage of heavy-ion collisions and they experience the whole evolution of the Quark-Gluon Plasma medium. Femtoscopic correlations, i.e. two-particle correlations at low relative momentum, are sensitive to the final-state interactions as well as to the extent of the region from which the correlated particles are emitted. A study of correlations between heavy-flavor mesons and identified charged hadrons could shed light on their interactions in the hadronic phase. STAR has performed the first measurement of femtoscopic correlation between D^0 -hadron pairs at mid-rapidity in Au+Au collisions at $\sqrt{s_{NN}} = 200$ GeV. D^0 mesons are reconstructed via the $K^\mp - \pi^\pm$ decay channel using topological criteria enabled by the Heavy Flavor Tracker with excellent track pointing resolution. We will present the femtoscopic correlation functions between $D^0/\overline{D^0}$ - π^\pm , $D^0/\overline{D^0}$ - K^\pm and $D^0/\overline{D^0}$ - p^\pm pairs for $D^0/\overline{D^0}$ with transverse momentum above 1 GeV/c in the 0 – 80% centrality range. STAR results will be compared with existing theory predictions and its physics implications will also be discussed.
