

Lower-dimensional gravity, DSSYK and group theory

jeudi 20 juin 2024 14:00 (1 heure)

In this talk, I will report on recent progress in understanding lower-dimensional gravitational models structurally from group theory. The main strength of this approach seems to be its universality in describing different models. In particular, I will discuss how it can be used to argue for a bulk holographic dual of double-scaled SYK (DSSYK) in terms of sine dilaton gravity.

Orateur: MERTENS, Thomas (University of Ghent, Belgium)

Classification de Session: Formal theory
