## Objective of the biological dose

effects of the physical dose on biological tissues

$$D_B = RBE \times D_\varphi = \frac{-\alpha_{ref} + \sqrt{\bar{\alpha} D_\varphi + (\sqrt{\bar{\beta}} D_\varphi)^2}}{2 \beta_{ref}}$$

- $D_B$ : biological dose
- $D_\varphi$ : physical dose
- $RBE$ : Relative Biological Effectiveness
- $\alpha_{ref}/\beta_{ref}$ : reference X-ray beam values (0.313/0.0615)
- $\bar{\alpha}/\sqrt{\bar{\beta}}$ : mean  $\alpha/\sqrt{\beta}$  values

## nano/micro scale

- mMKM  
(Kase et al., 2006)
- NanOx  
(Cunha et al., 2017)

## cellular scale

## macro scale

Cell line Human Salivary Glands (HSG): HSG\_mMKM.db or HSG\_NanOx.db

⇒ easy to provide new cell lines or biophysical models

### BioDose actor

- validated in water and patient
- with statistical uncertainty
- execution speed similar to dose actor

### Availability

- current GATE release (9.4)
- in future GATE 10 official release

to be published soon in Medical Physics journal
