Cosmic Rays and Neutrinos in the Multi-Messenger Era,  
APC Laboratory, Paris, December 9, 2024

# TA Site

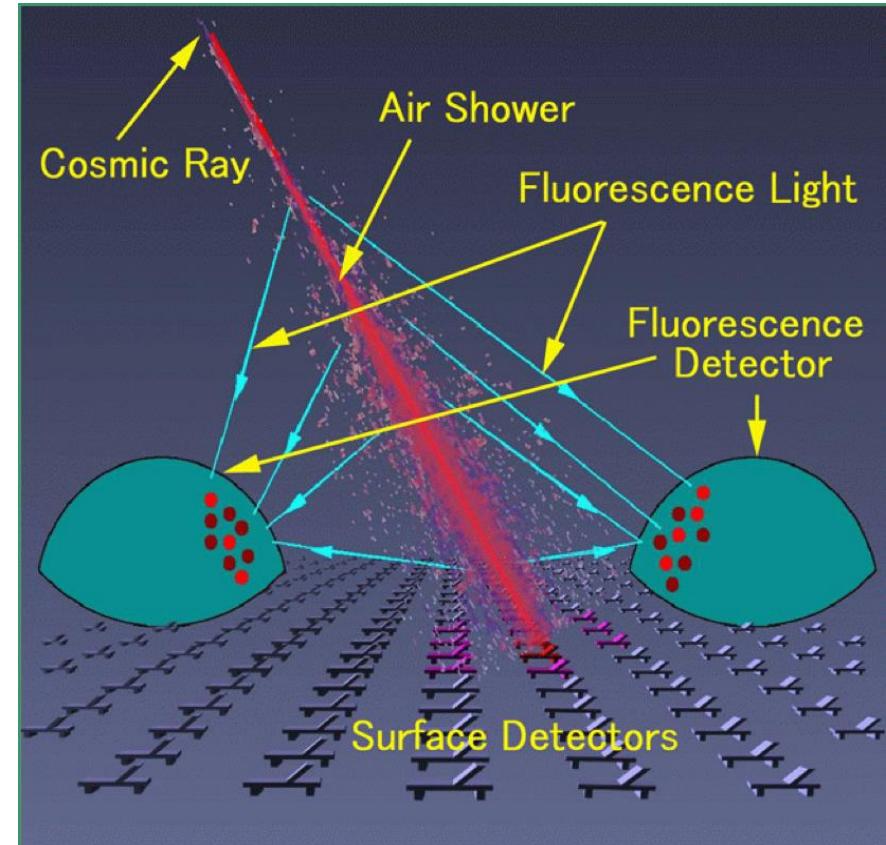

**TA: Utah, USA**  
 $39^\circ \text{ N}$   
 $700\text{km}^2$   
**Operational since May 2008**

**Auger:**  
**Malargue, Argentine**  
 $35^\circ \text{ S}$   
 $3000\text{km}^2$   
**Operational since 2004**

# Telescope Array (TA)

- The largest cosmic ray detector in the northern hemisphere.
  - Constructed in Utah, USA, by Japan, US, Russia, and Korea
  - 700km<sup>2</sup> (c.f. Singapore)
    - c.f. AGASA - 100km<sup>2</sup>
  - Use both types of detectors: fluorescence detectors (FD) and surface detectors (SD)

# TA Detectors

- Millard county, Utah, US

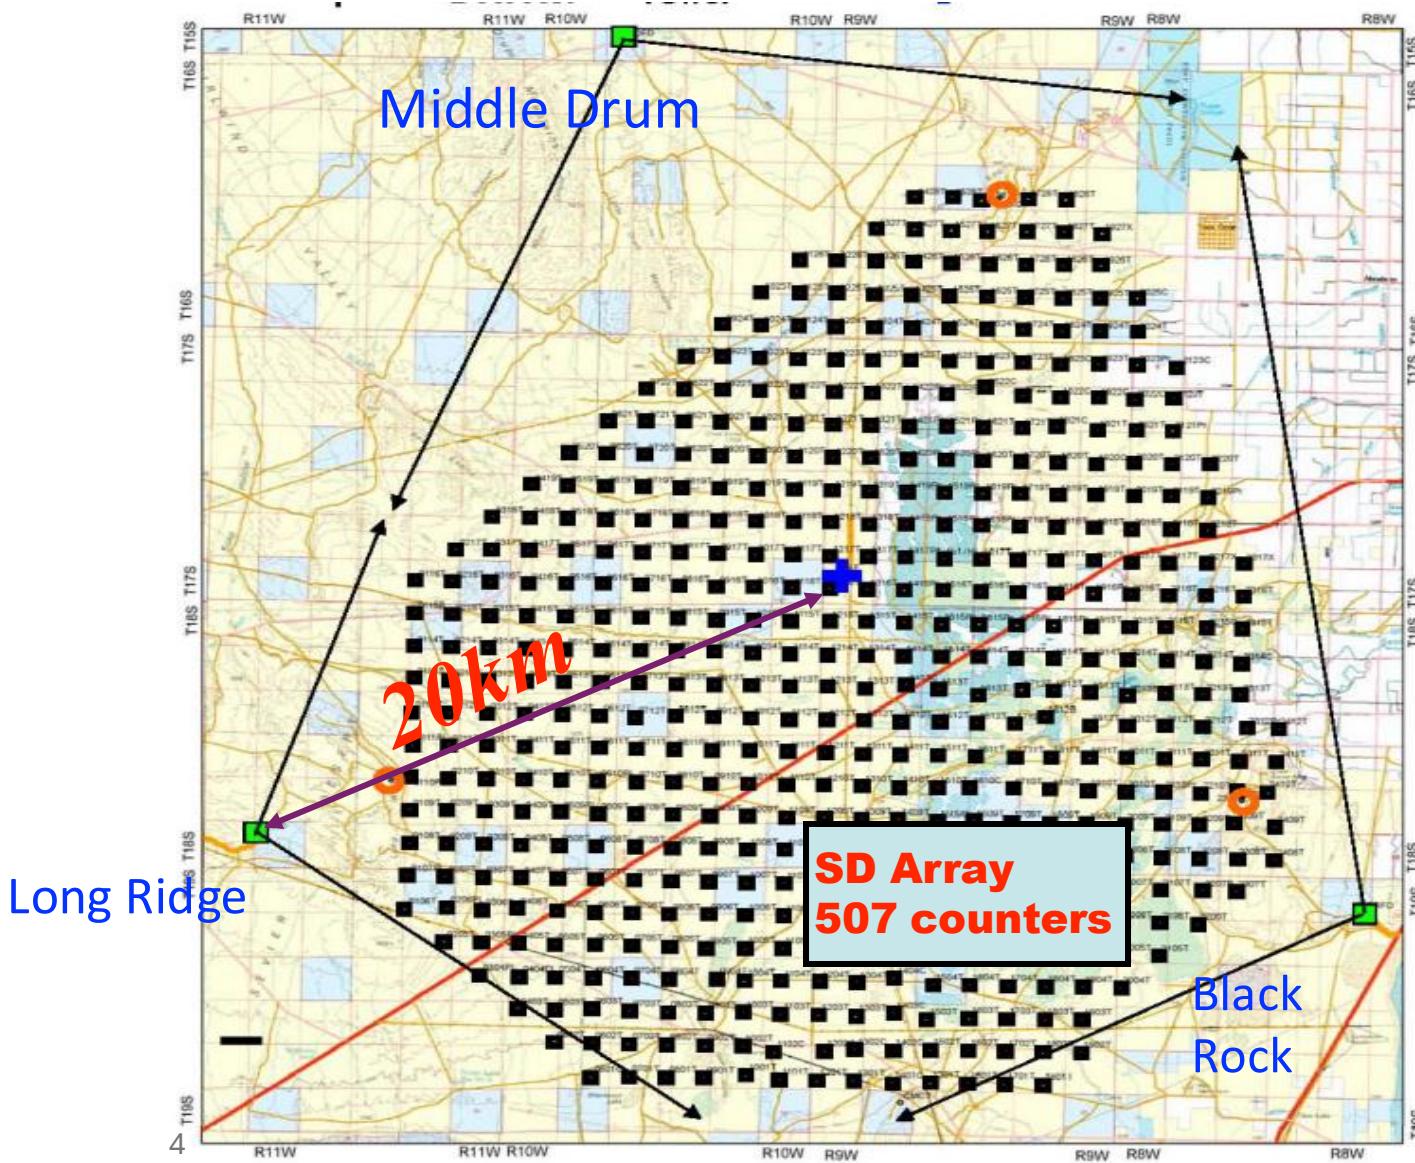

39N, 141W

- 507 SDs

- 3m<sup>2</sup> double-layered plastic scintillators
  - Water Cherenkov tanks in Auger
- 40MHz digitization (cf. AGASA 10us integrated)
- 1.2km separation
- 700 km<sup>2</sup>
- cf. AGASA 100km<sup>2</sup>, Auger 3,000km<sup>2</sup>
- 100% duty cycle

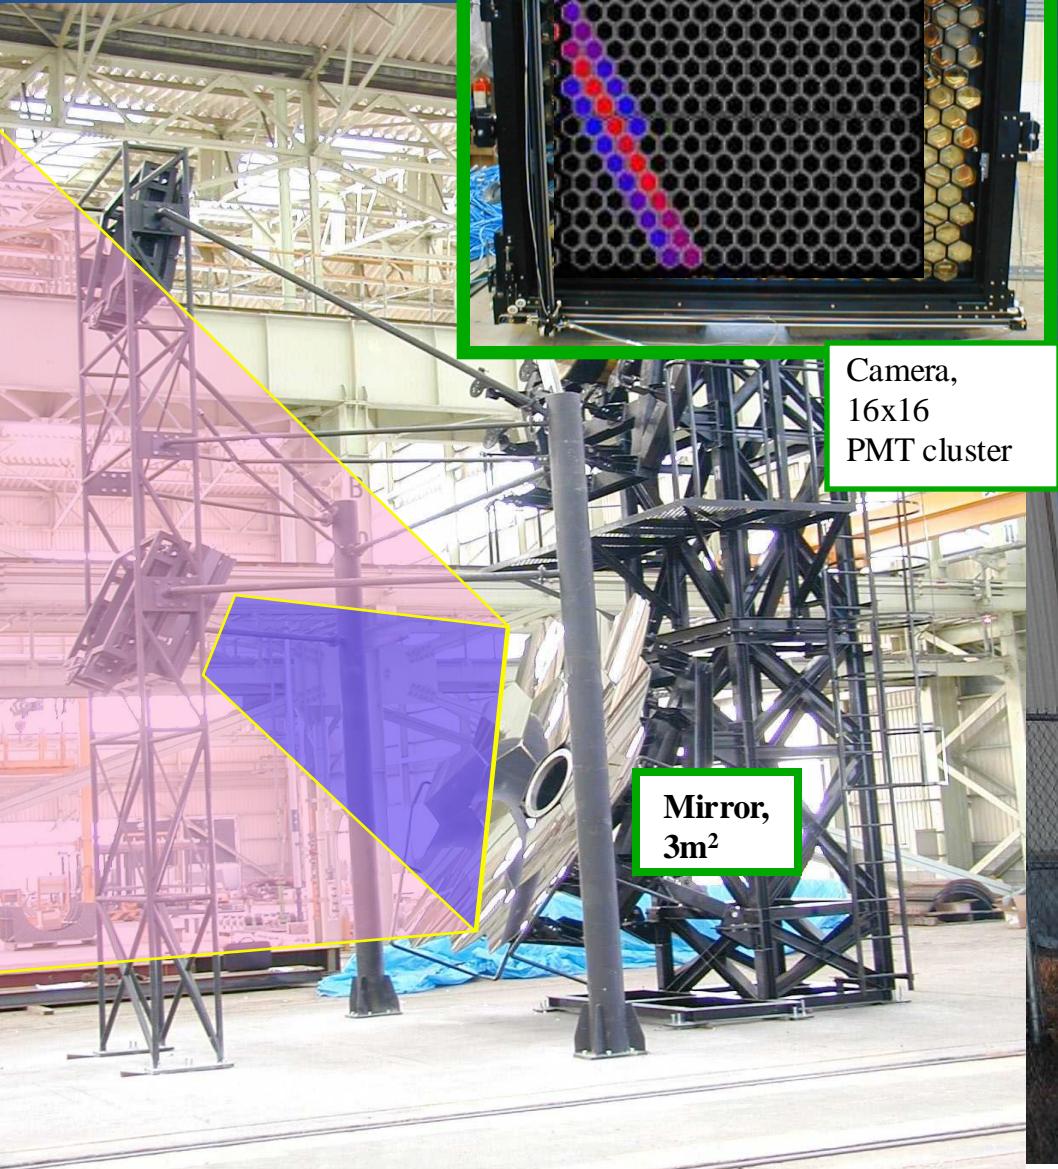

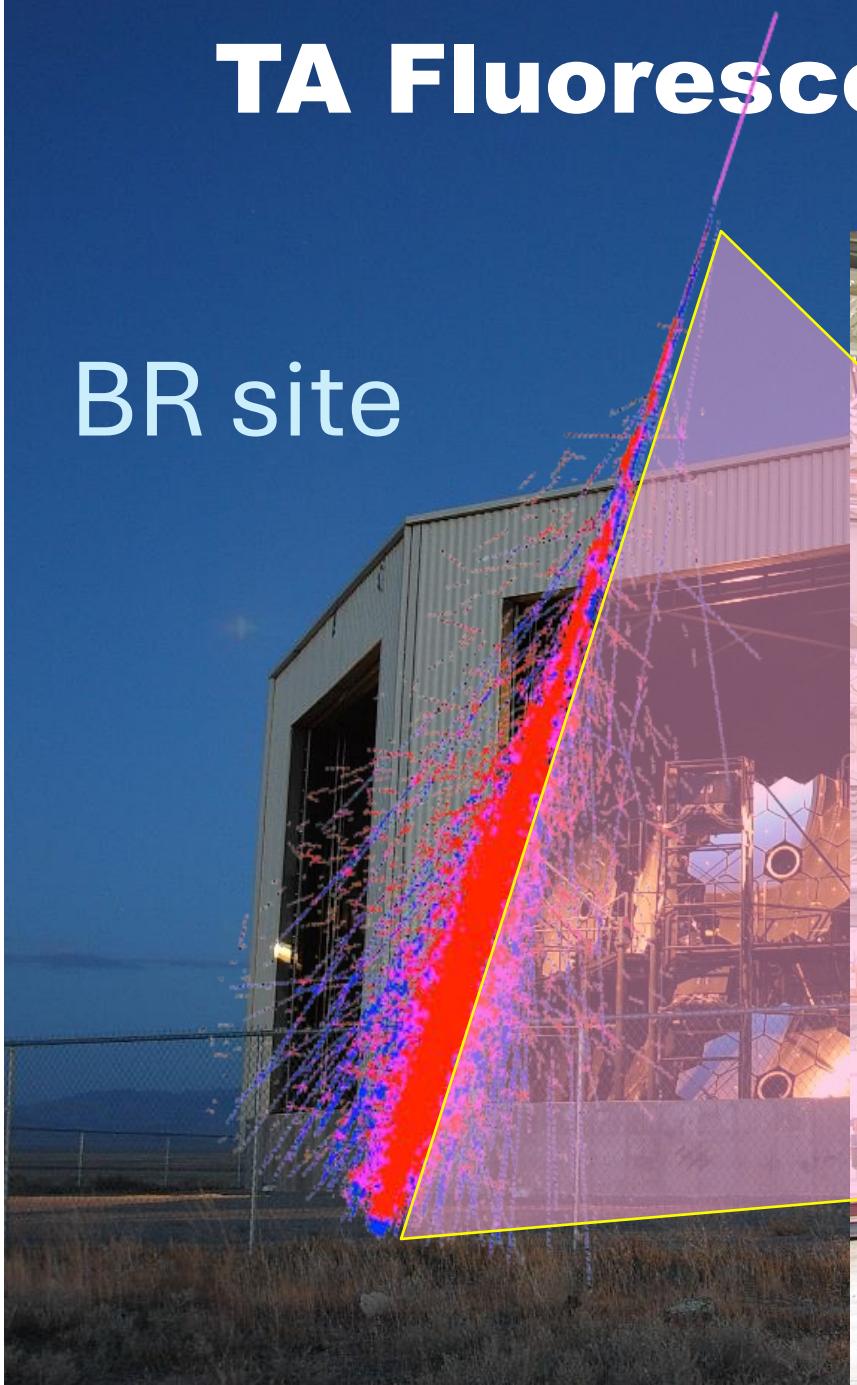

- 3 FD stations

- Black Rock - 12
- Long Ridge - 12
- Middle Drum – 14 (refurbished HiRes)
- 10% duty cycle

# TA Fluorescence Detectors

BR site

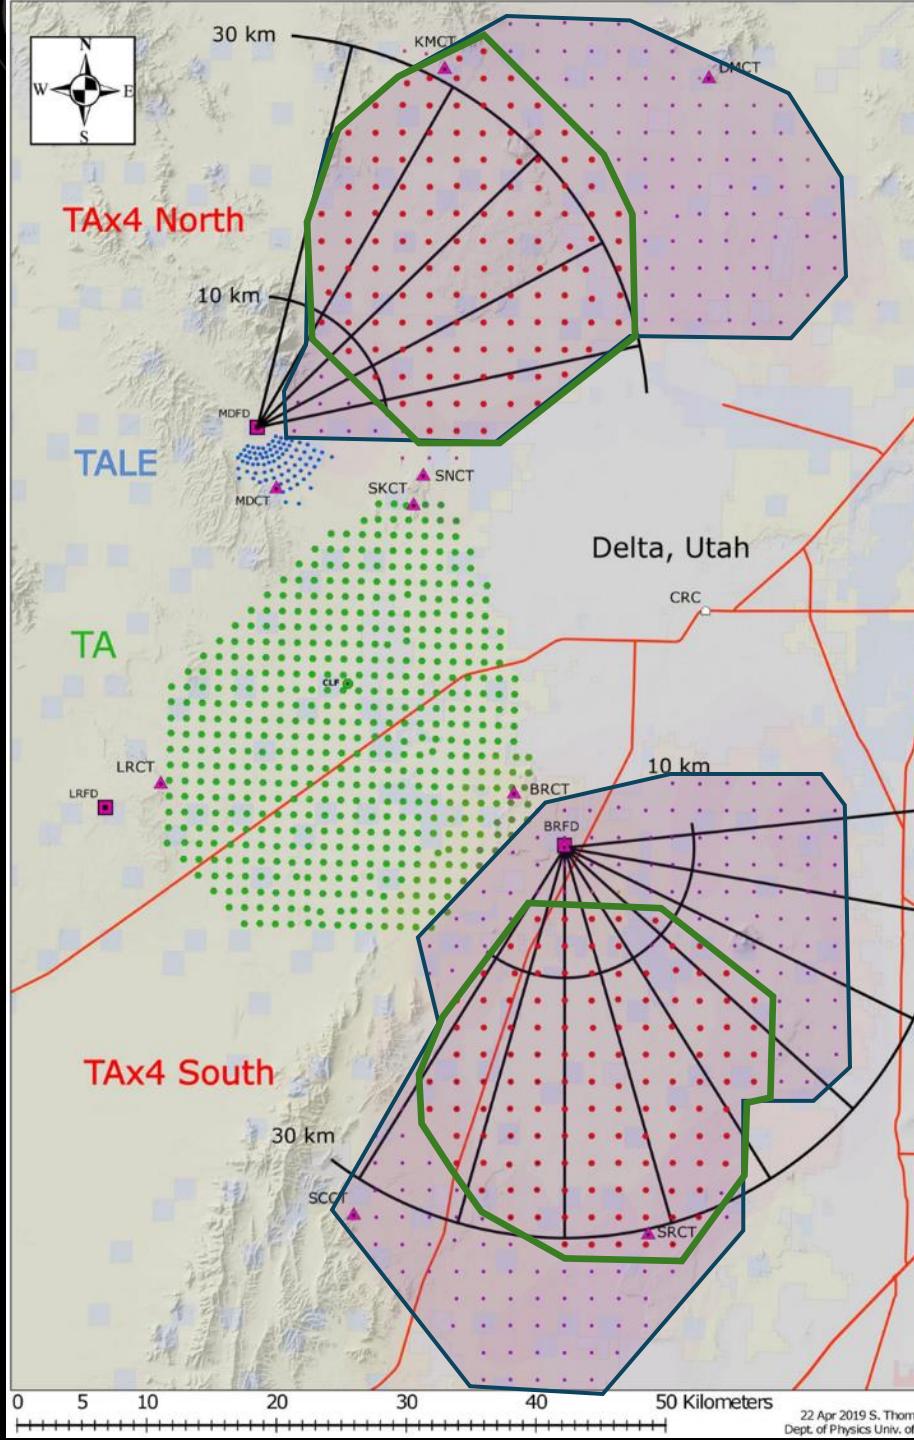

# TAx4 detectors

## Expanded Surface Array

- 2.08km spacing (1.2km TA)
- SDs similar design as TA
- **257** of planned **500** deployed (operational since Nov/2019)

## Fluorescence Telescopes

- 4 telescopes viewing NE lobe (since Jun/2019)
- 8 telescopes viewing SE lobe (since Aug/2020)
- $3^\circ$ - $17^\circ$  elevation

# TA Highest Energy Event "Amateras particle"

SCIENCE

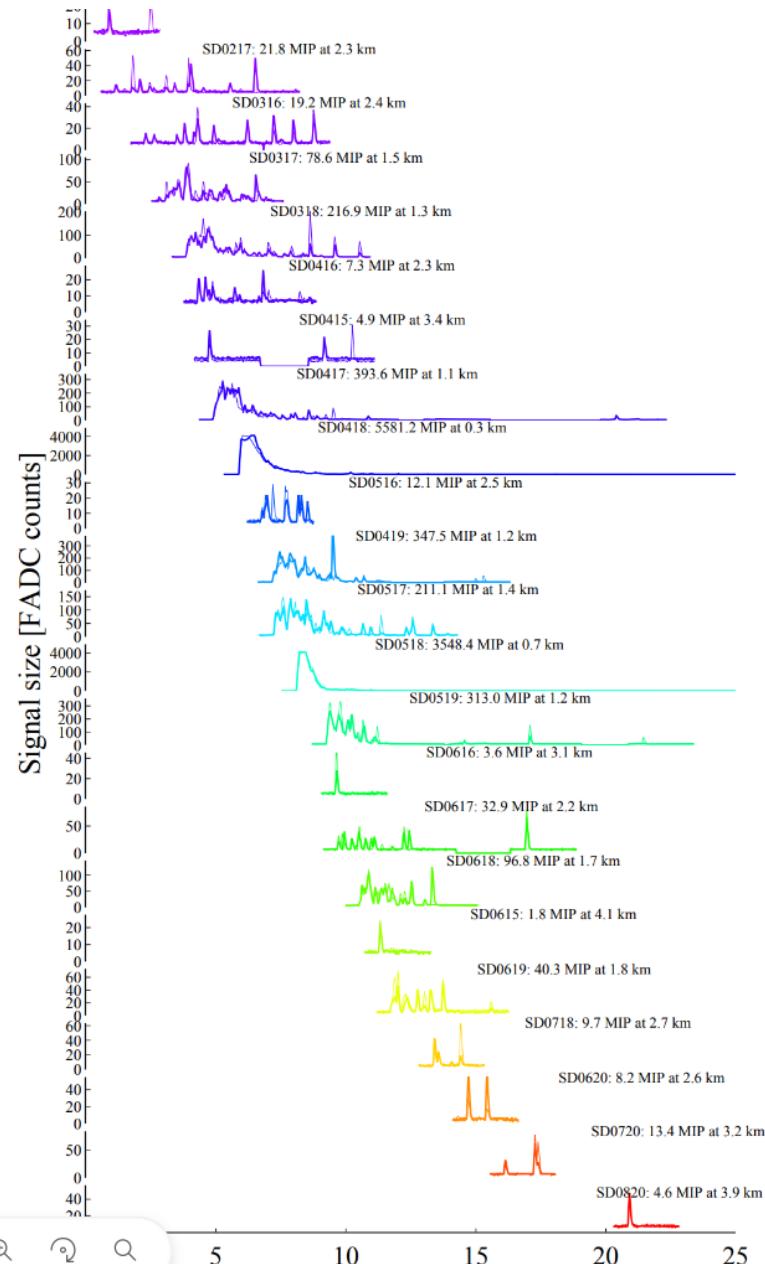

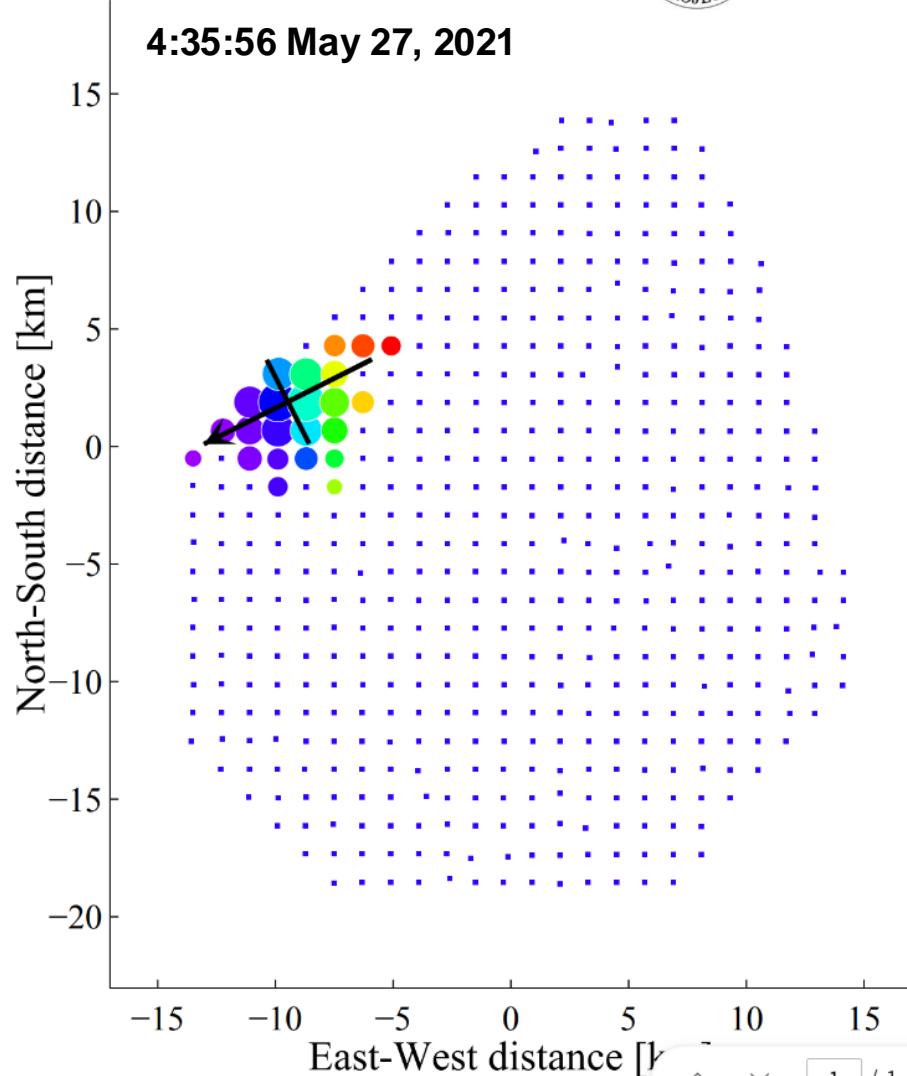

23 Nov 2023

Vol 382, Issue 6673

pp. 903-907

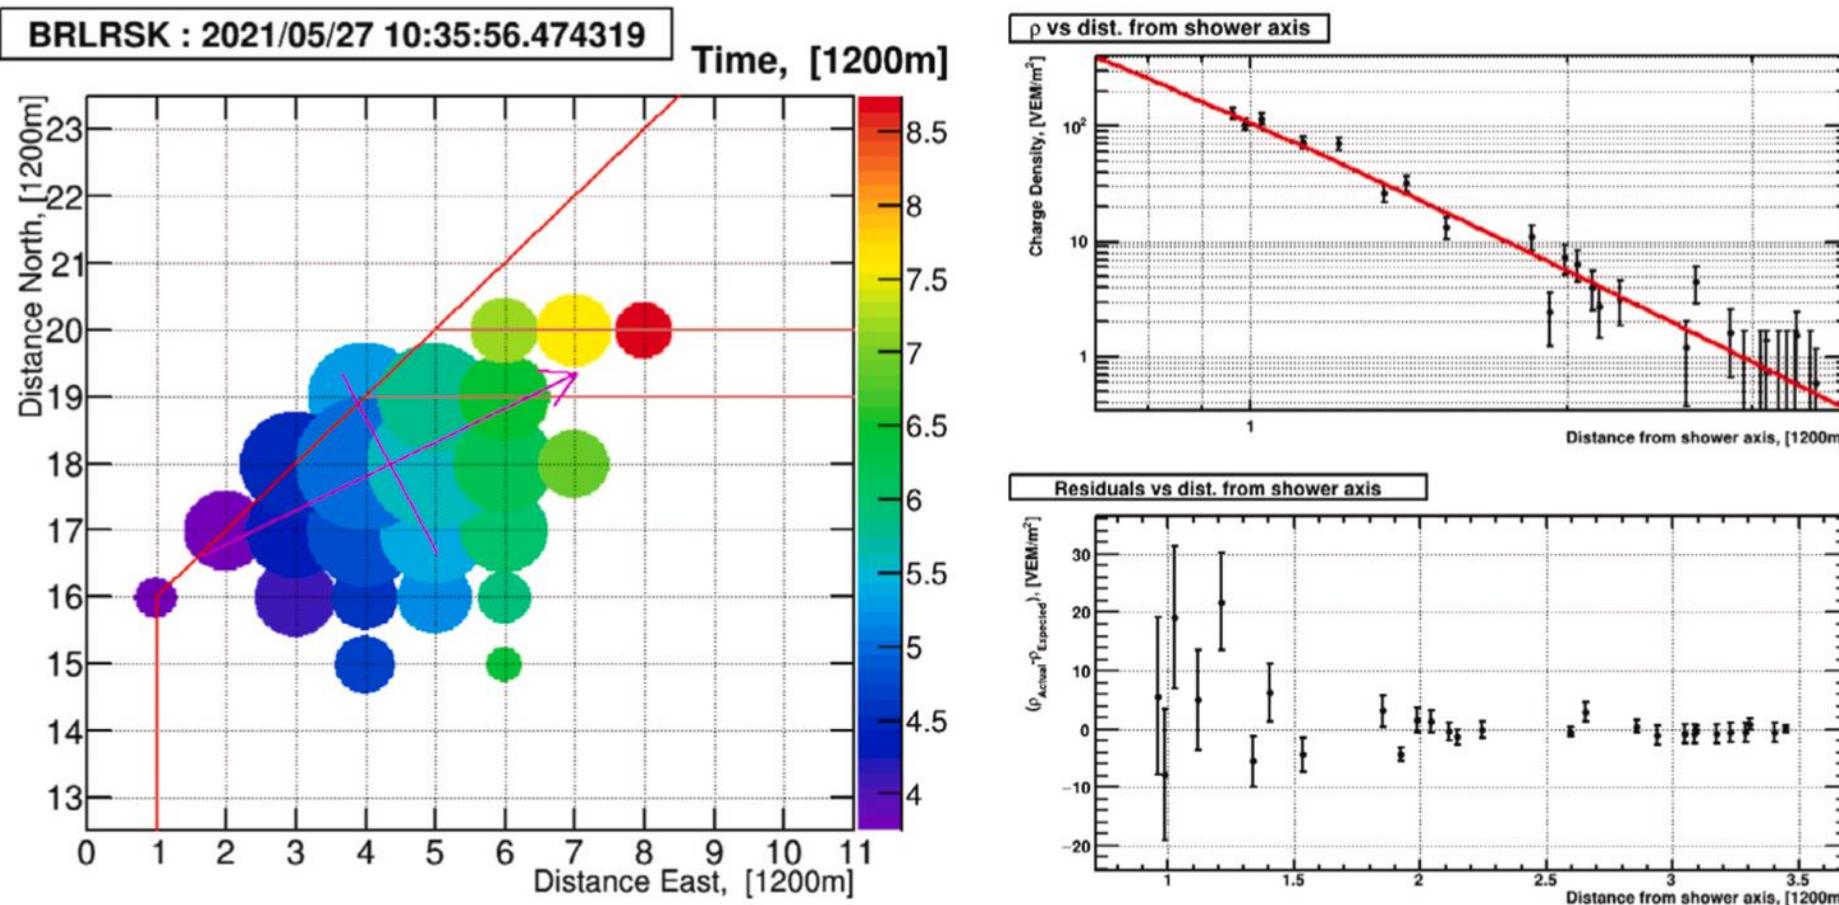

DOI: 10.1126/science.abo5095

## Surface detector array of TA

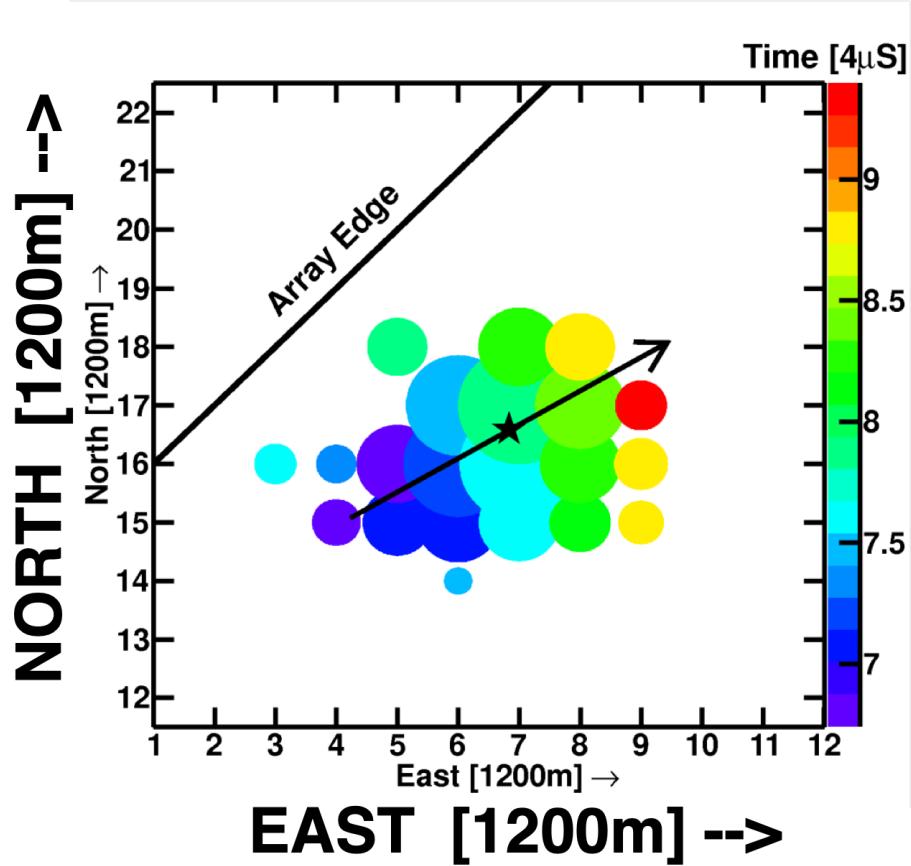

# TA highest event "Amateras"

2021-05-27 10:35:56.47, No FD observation

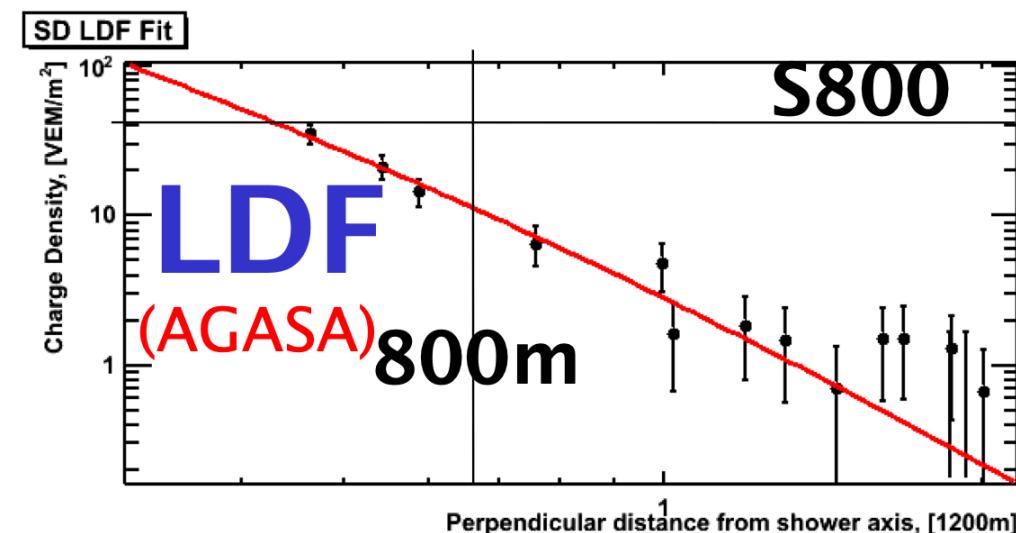

Date (UTC)	Energy (EeV)	$S_{800}$ (m <sup>-2</sup> )	Zenith angle	Azimuth angle	R.A.	Dec.	Directional uncertainty
May 27 2021 10:35:56	$244 \pm 29$ (stat.) $\pm 51$ (syst.)	$530 \pm 57$	$38.6^\circ$	$206.8^\circ$	$255.9^\circ$	$16.1^\circ$	$0.8^\circ$

# SD Event Reconstruction

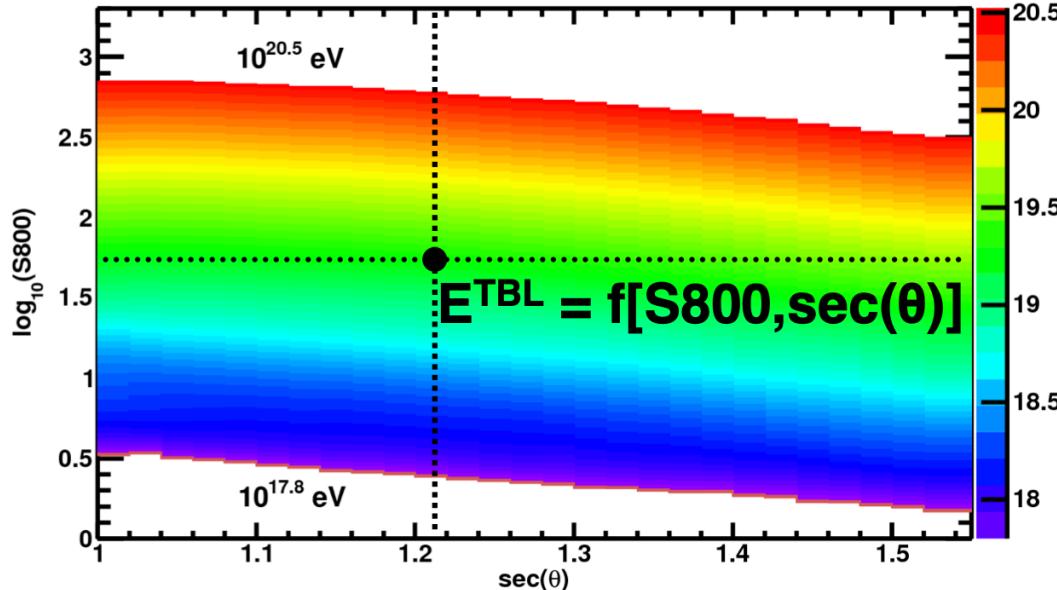

Use “S800” as an energy estimator

The SD array measures the  
“footprint” of a shower

# TA SD Energy Determination

Using hybrid events,

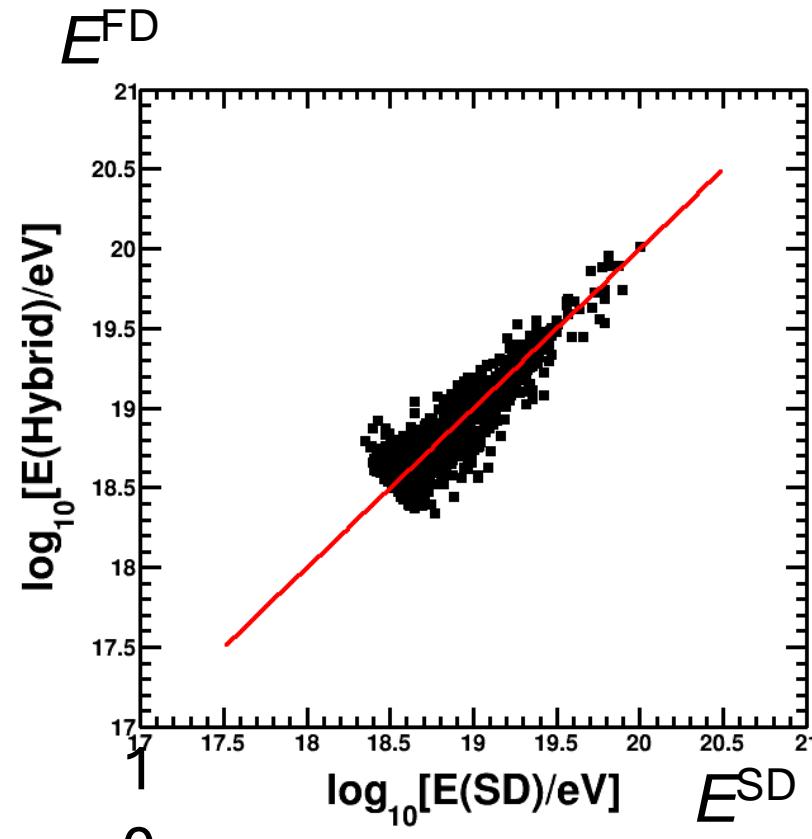

$$\left\langle \frac{E^{\text{TBL}}}{E^{\text{FD}}} \right\rangle_{\text{hyb}} = 1.27$$

cf. AGASA/HiRes = 1.25

- Final energy is by scaling  $E^{\text{TBL}}$ :

$$E_{\text{SD}} = E^{\text{TBL}} / \left\langle \frac{E^{\text{TBL}}}{E^{\text{FD}}} \right\rangle_{\text{hyb}}$$

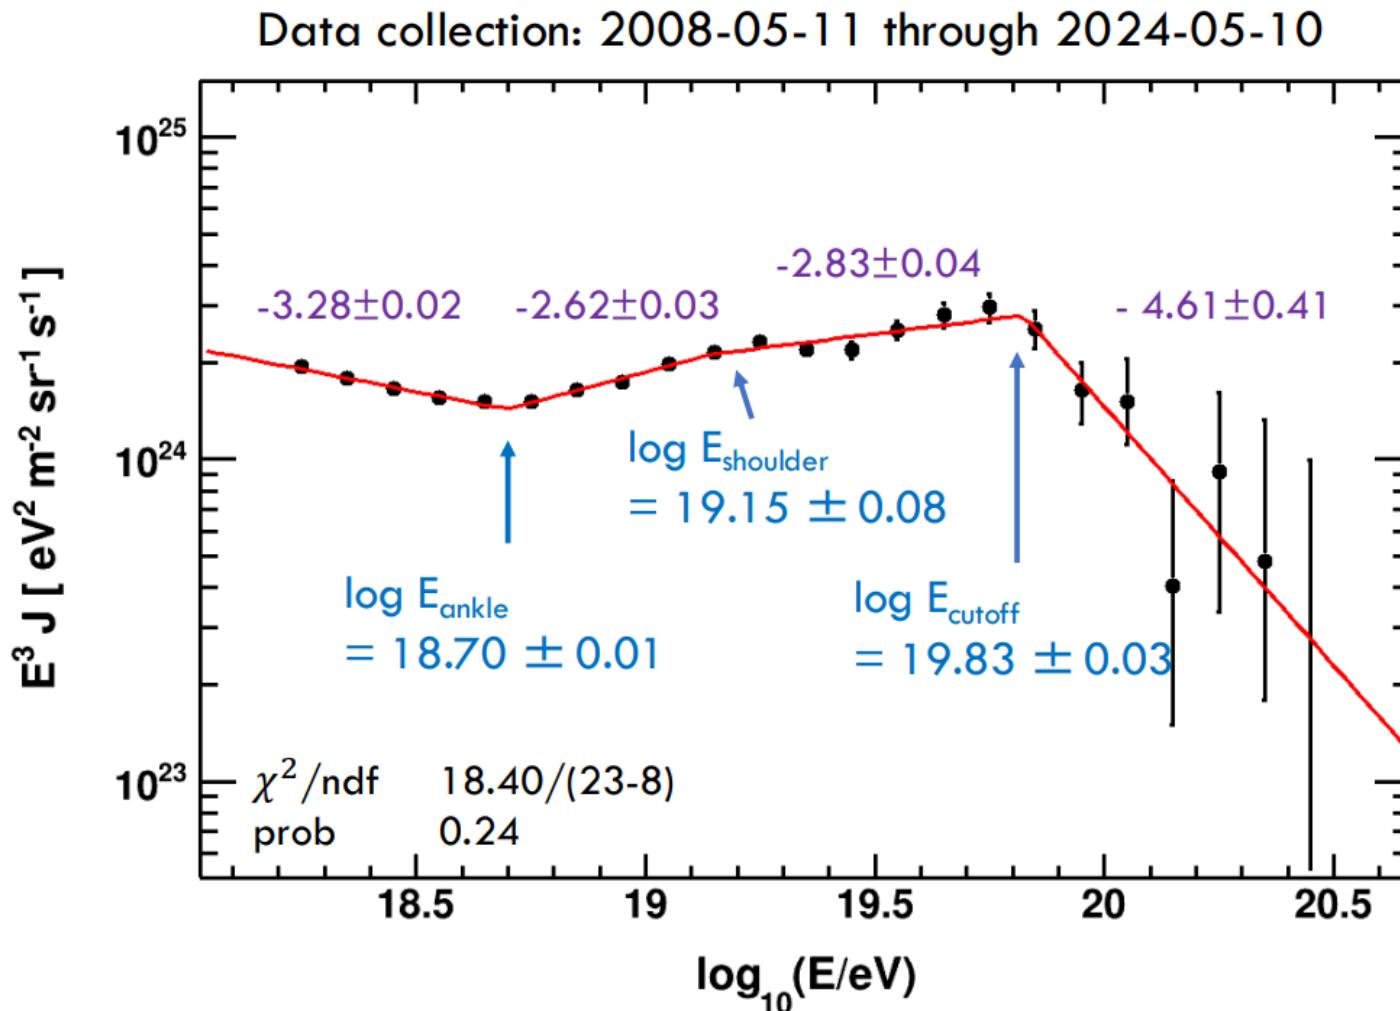

- 1st energy estimate: A lookup table by MC ( $S800, \theta$ )  $\rightarrow E^{\text{TBL}}$

# TA 2024 Energy Spectrum

J. Kim, D. Ivanov, G. Thomson, for TA,  
UHECR2024, November 20, Malargüe

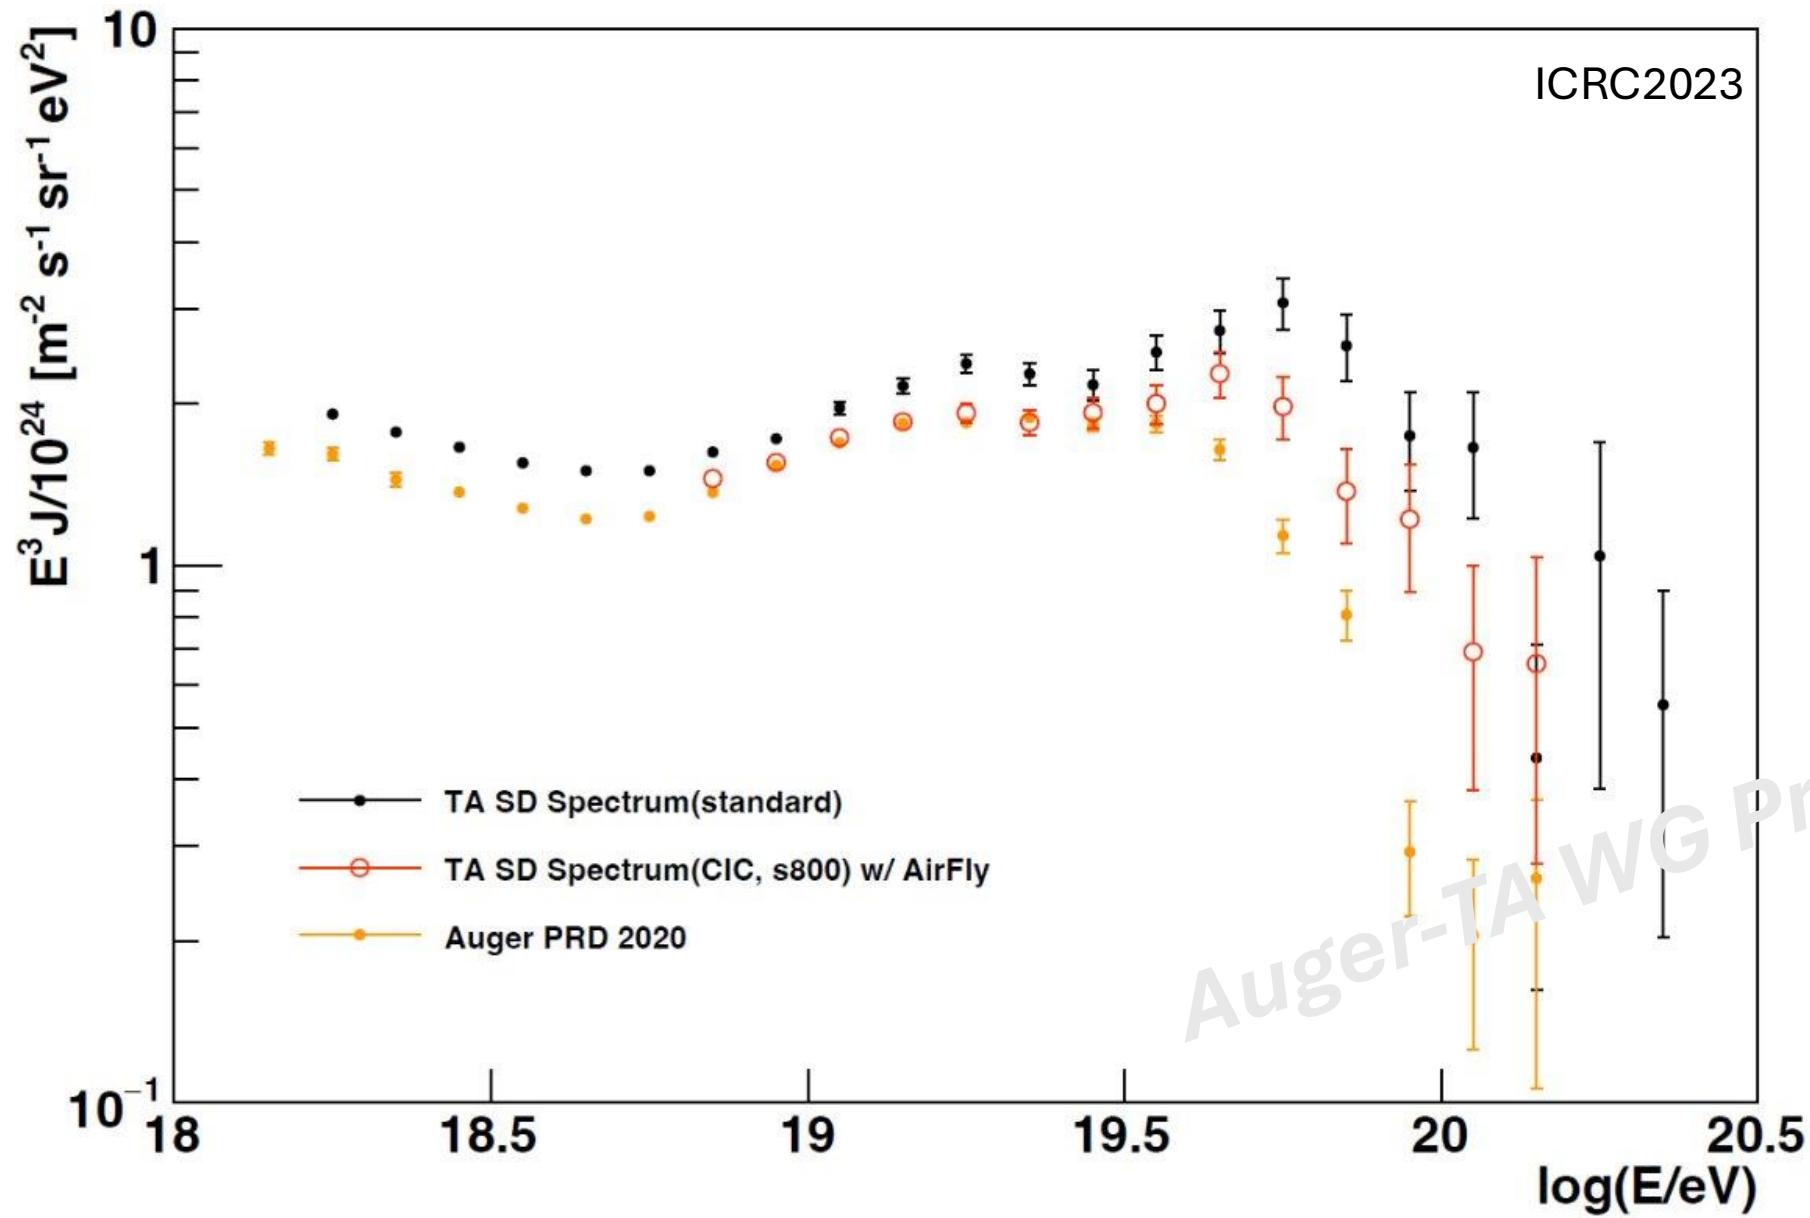

## Spectral Features in 16-year TA SD Data

- Spectral steepening at  $\log E = 19.83$ 
  - $N_{\text{exp}}: 173.7, N_{\text{obs}}: 97$
  - $P = 1.6 \times 10^{-10}, 6.3\sigma$
- "Instep" or "shoulder" found at  $\log E = 19.15$ 
  - $N_{\text{exp}}: 2156.4, N_{\text{obs}}: 1921$
  - $P = 1.3 \times 10^{-7}, 5.2\sigma$

# Recalculated the spectrum (common $\delta$ band)

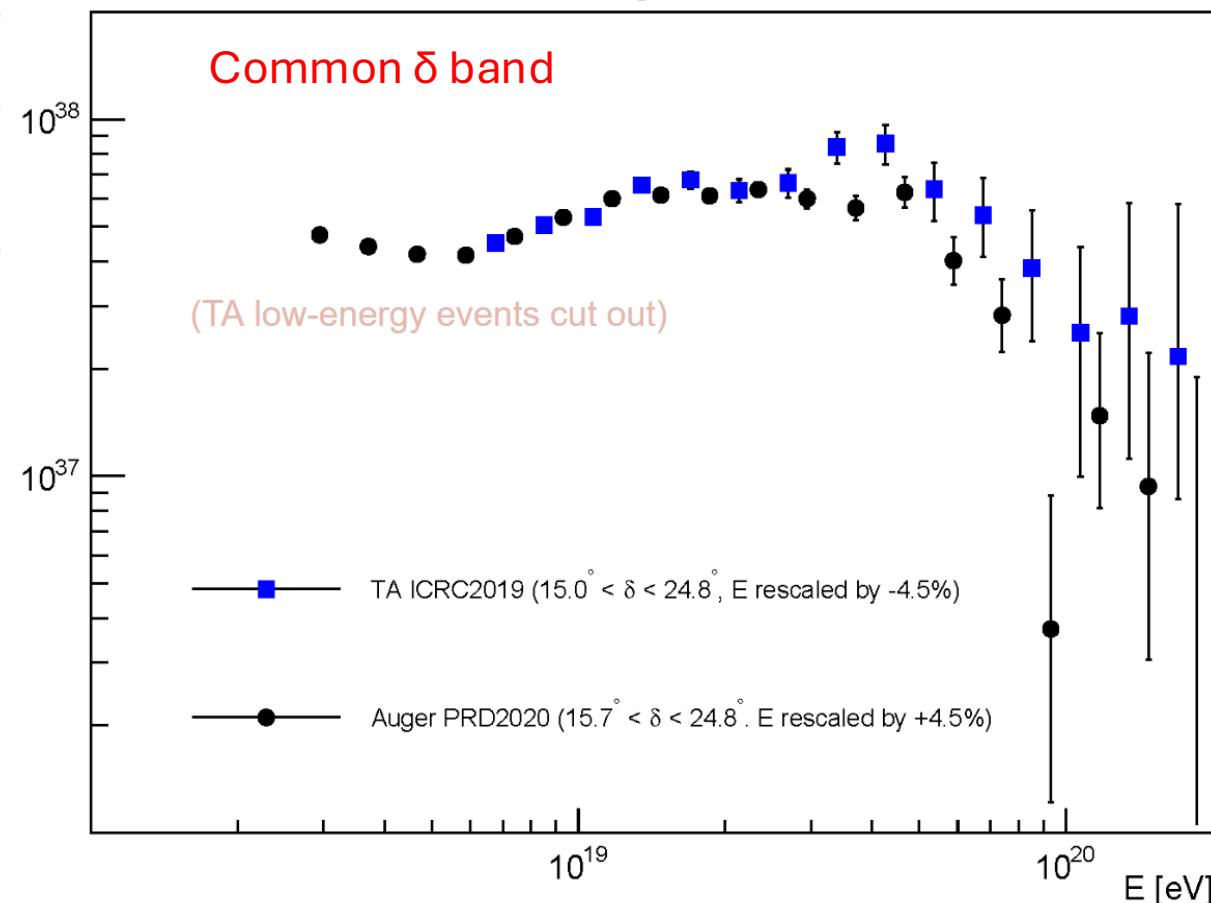

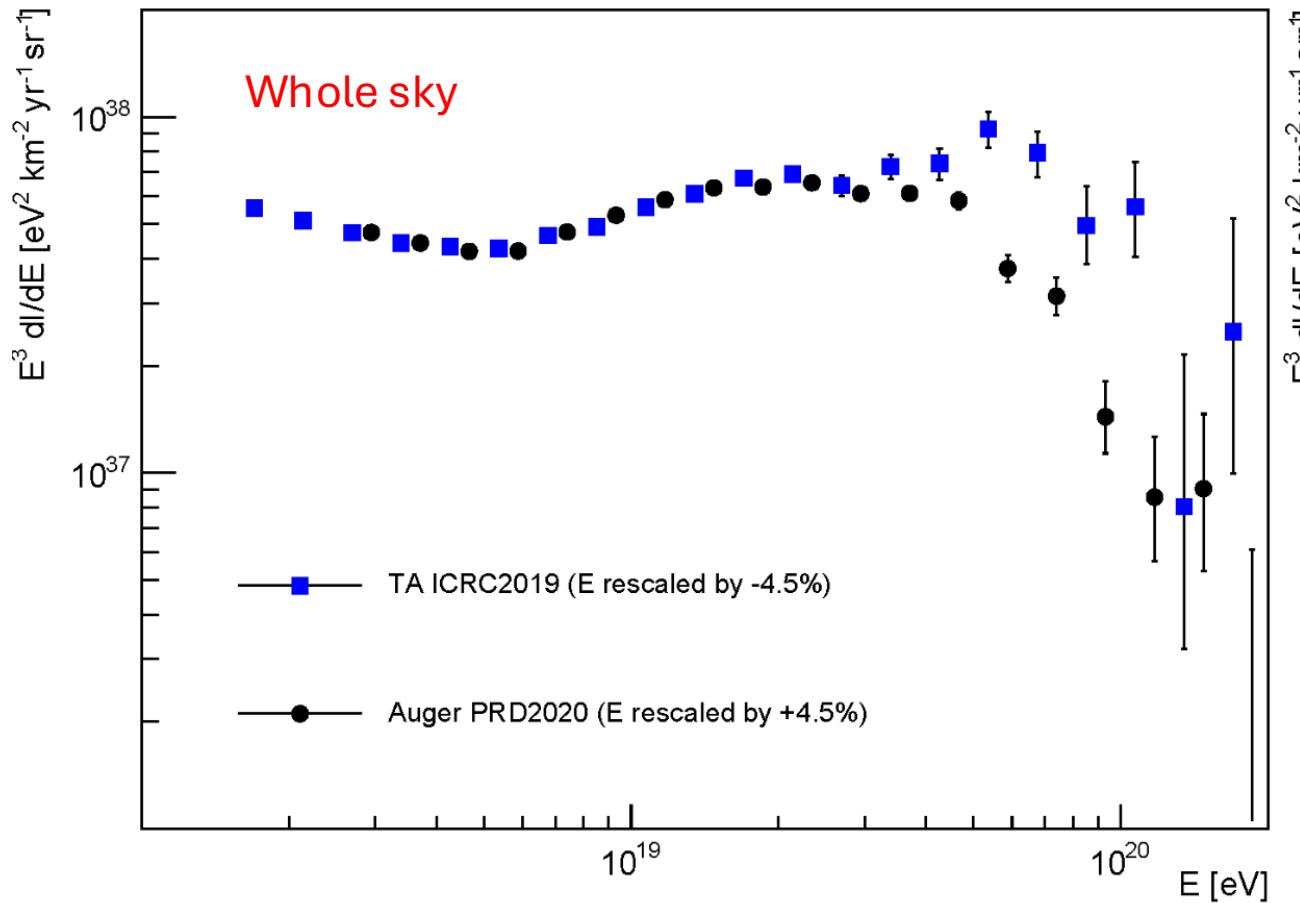

TA event are reconstructed using AirFly, CIC, and other parameters kept unchanged

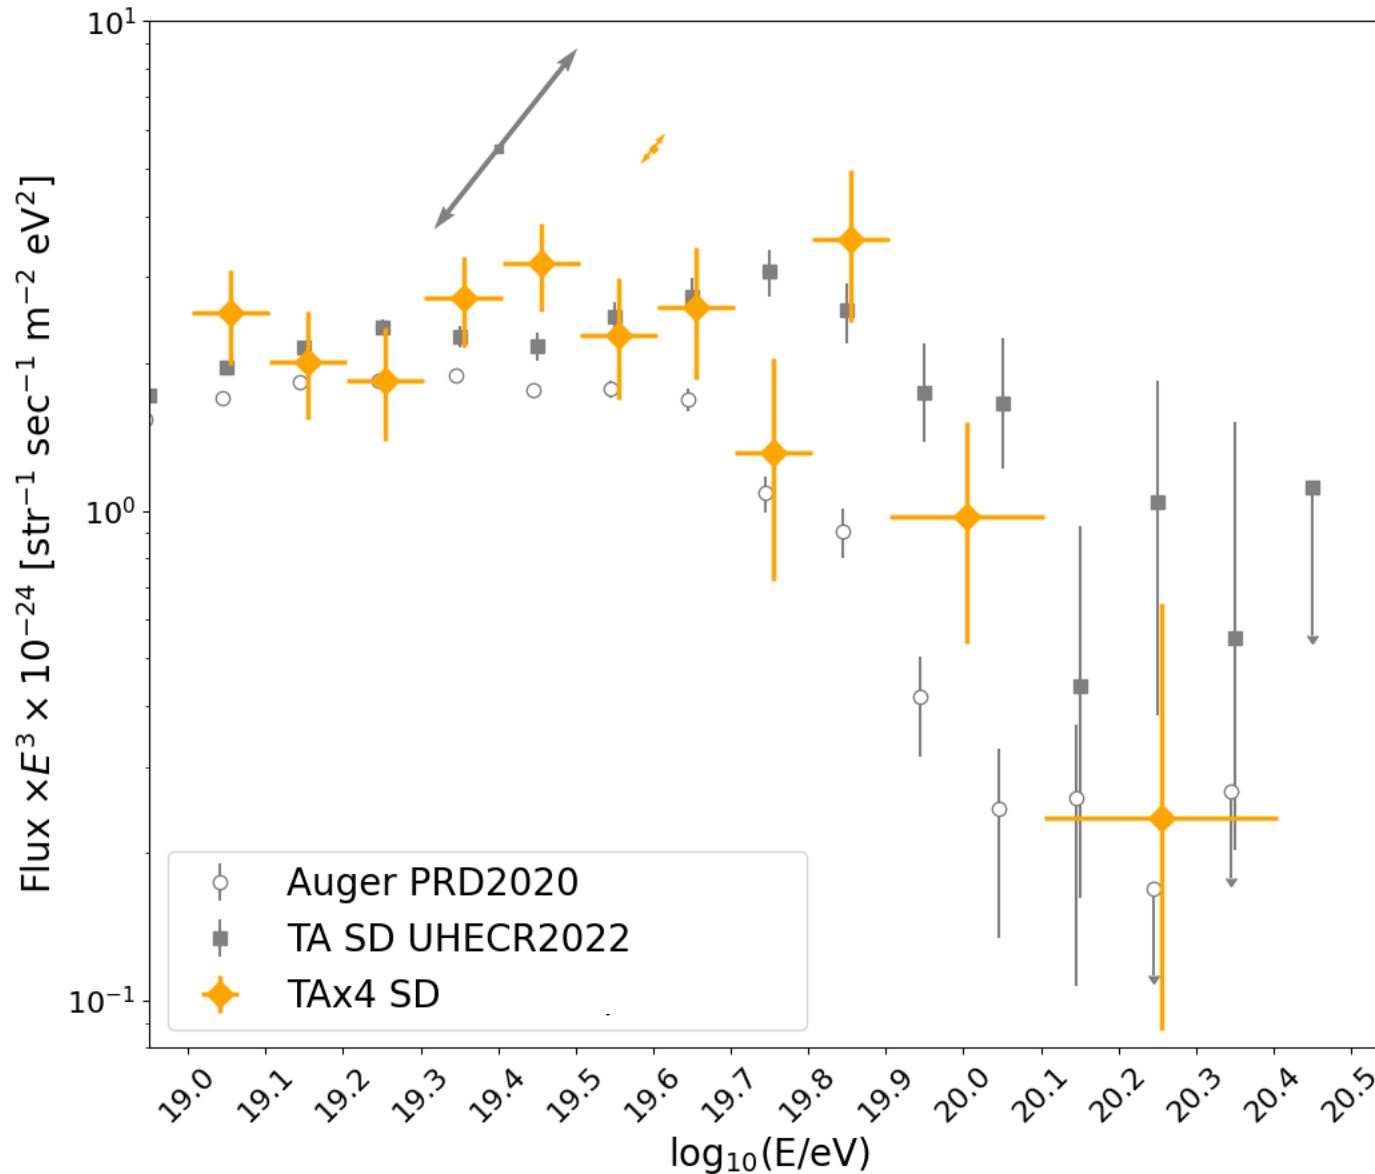

# Comparison with Auger

ICRC2021

- Auger:  $35^{\circ}$ S
  - $\theta$  up to  $60^{\circ}$
- TA:  $39^{\circ}$ N
  - $\theta$  up to  $55^{\circ}$
- Common declination band
  - $-15^{\circ} < \delta < 24.8^{\circ}$

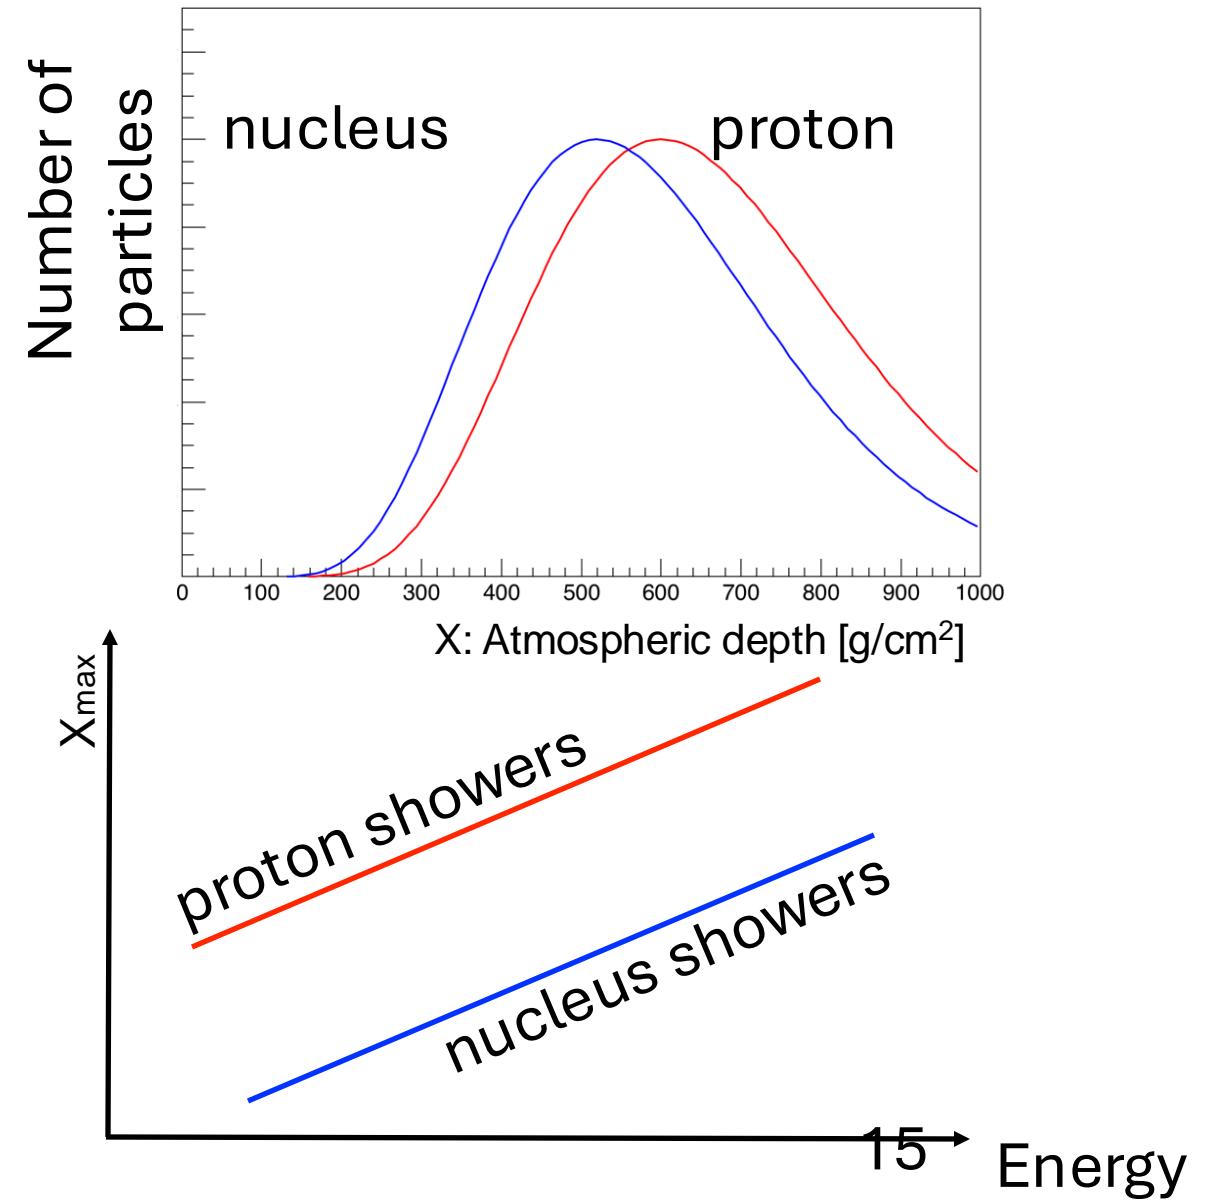

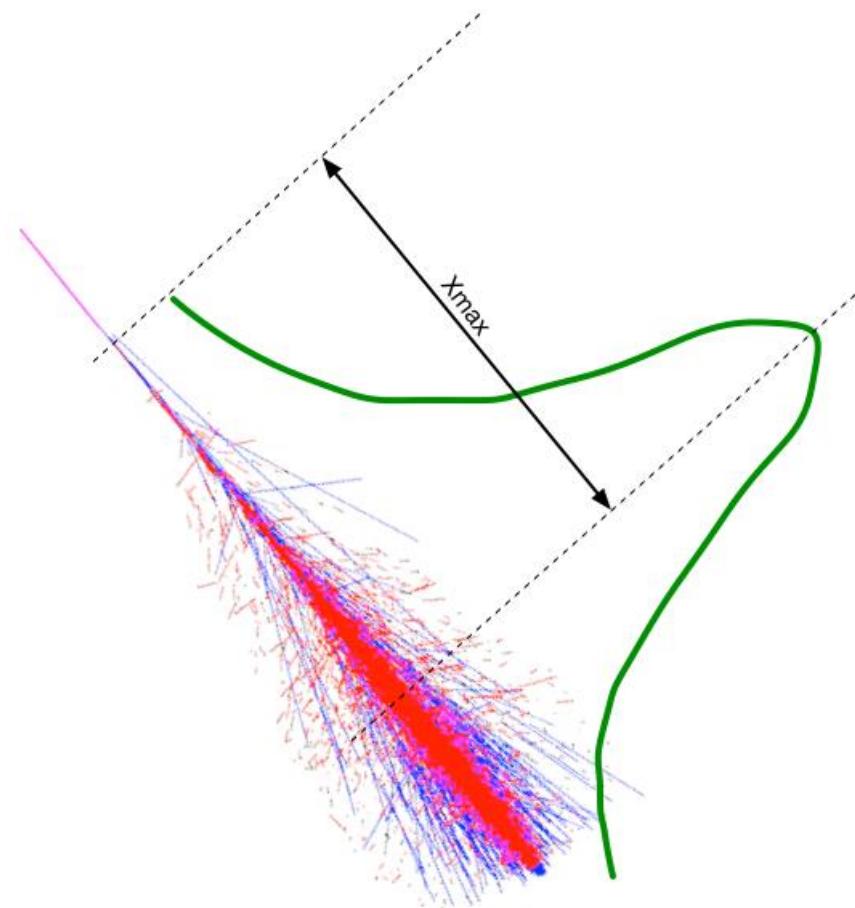

# TAx4 Spectrum

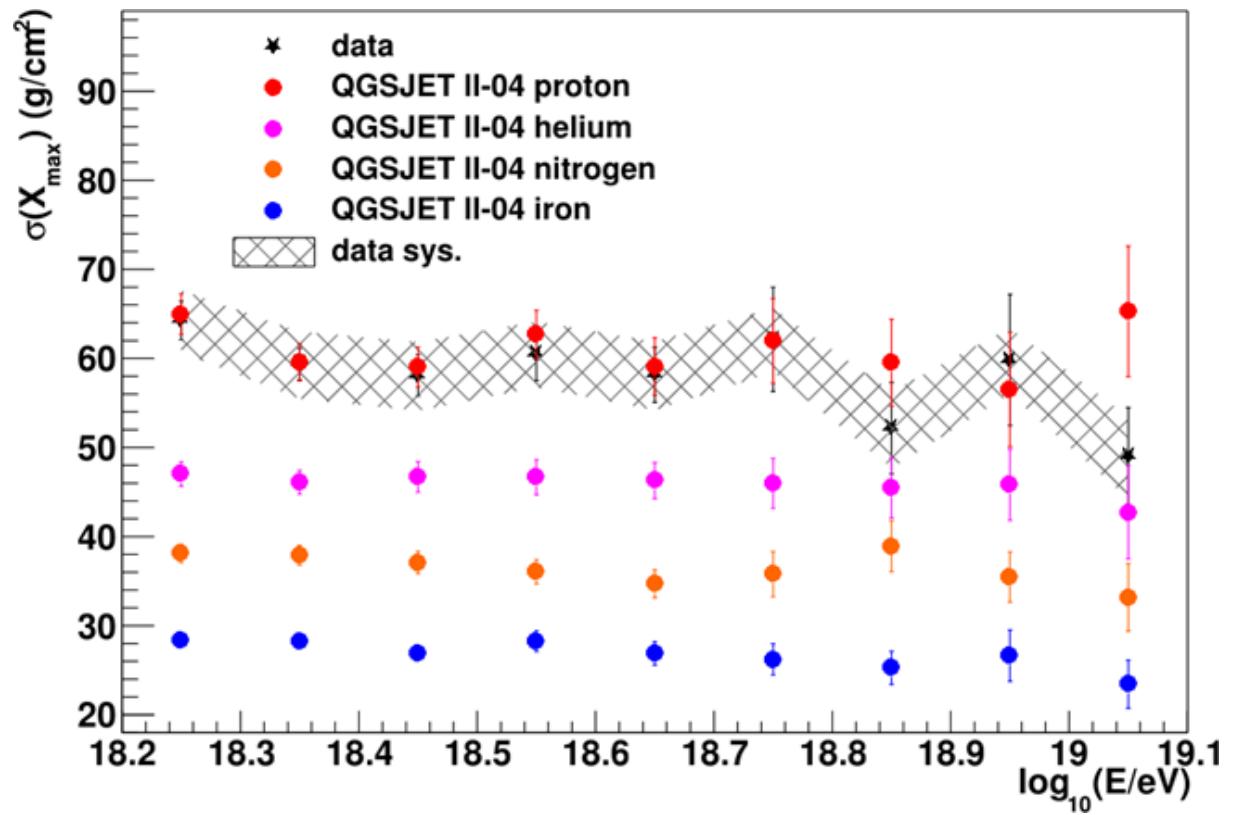

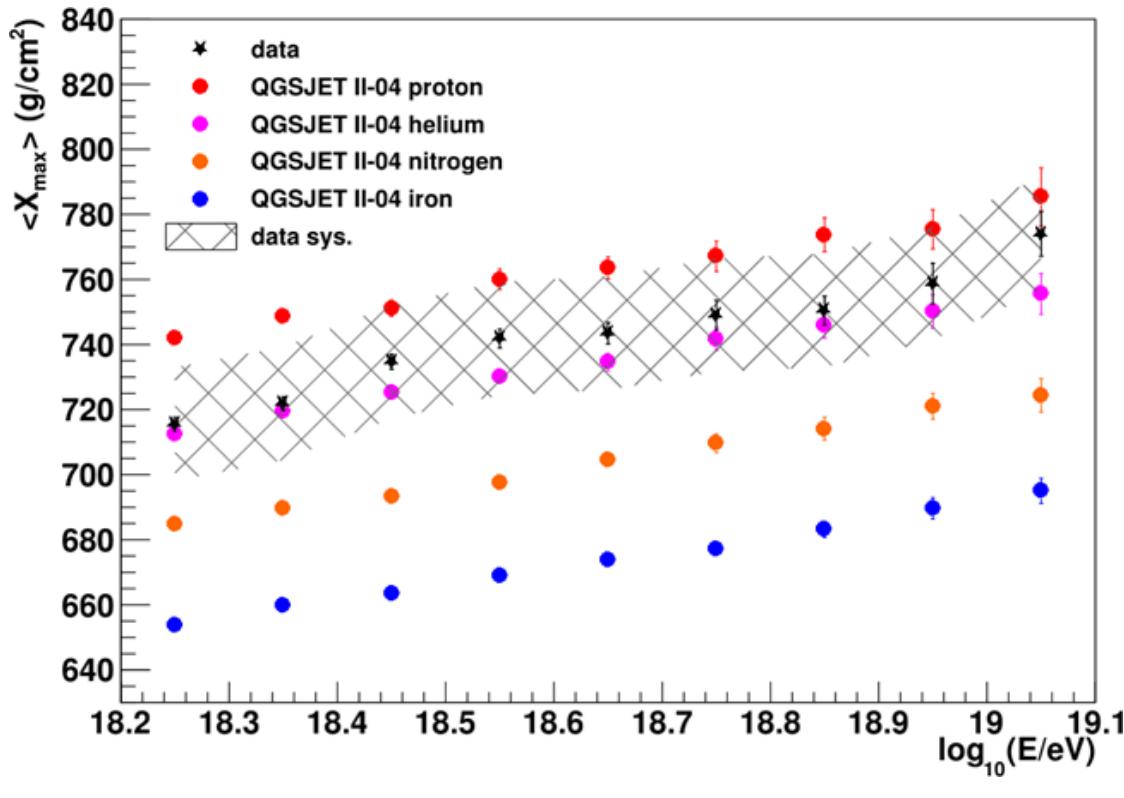

- TAx4 spectrum 2019-2022
- No inter-subarray triggers
- Consistent with TA SD

# Measurement of $X_{\max}$

# TA X<sub>max</sub> Measurement: BR/LR FD-SD Hybrid

R. U. Abbasi *et al* 2018 *ApJ* 858 76  
PoS(ICRC2019)280

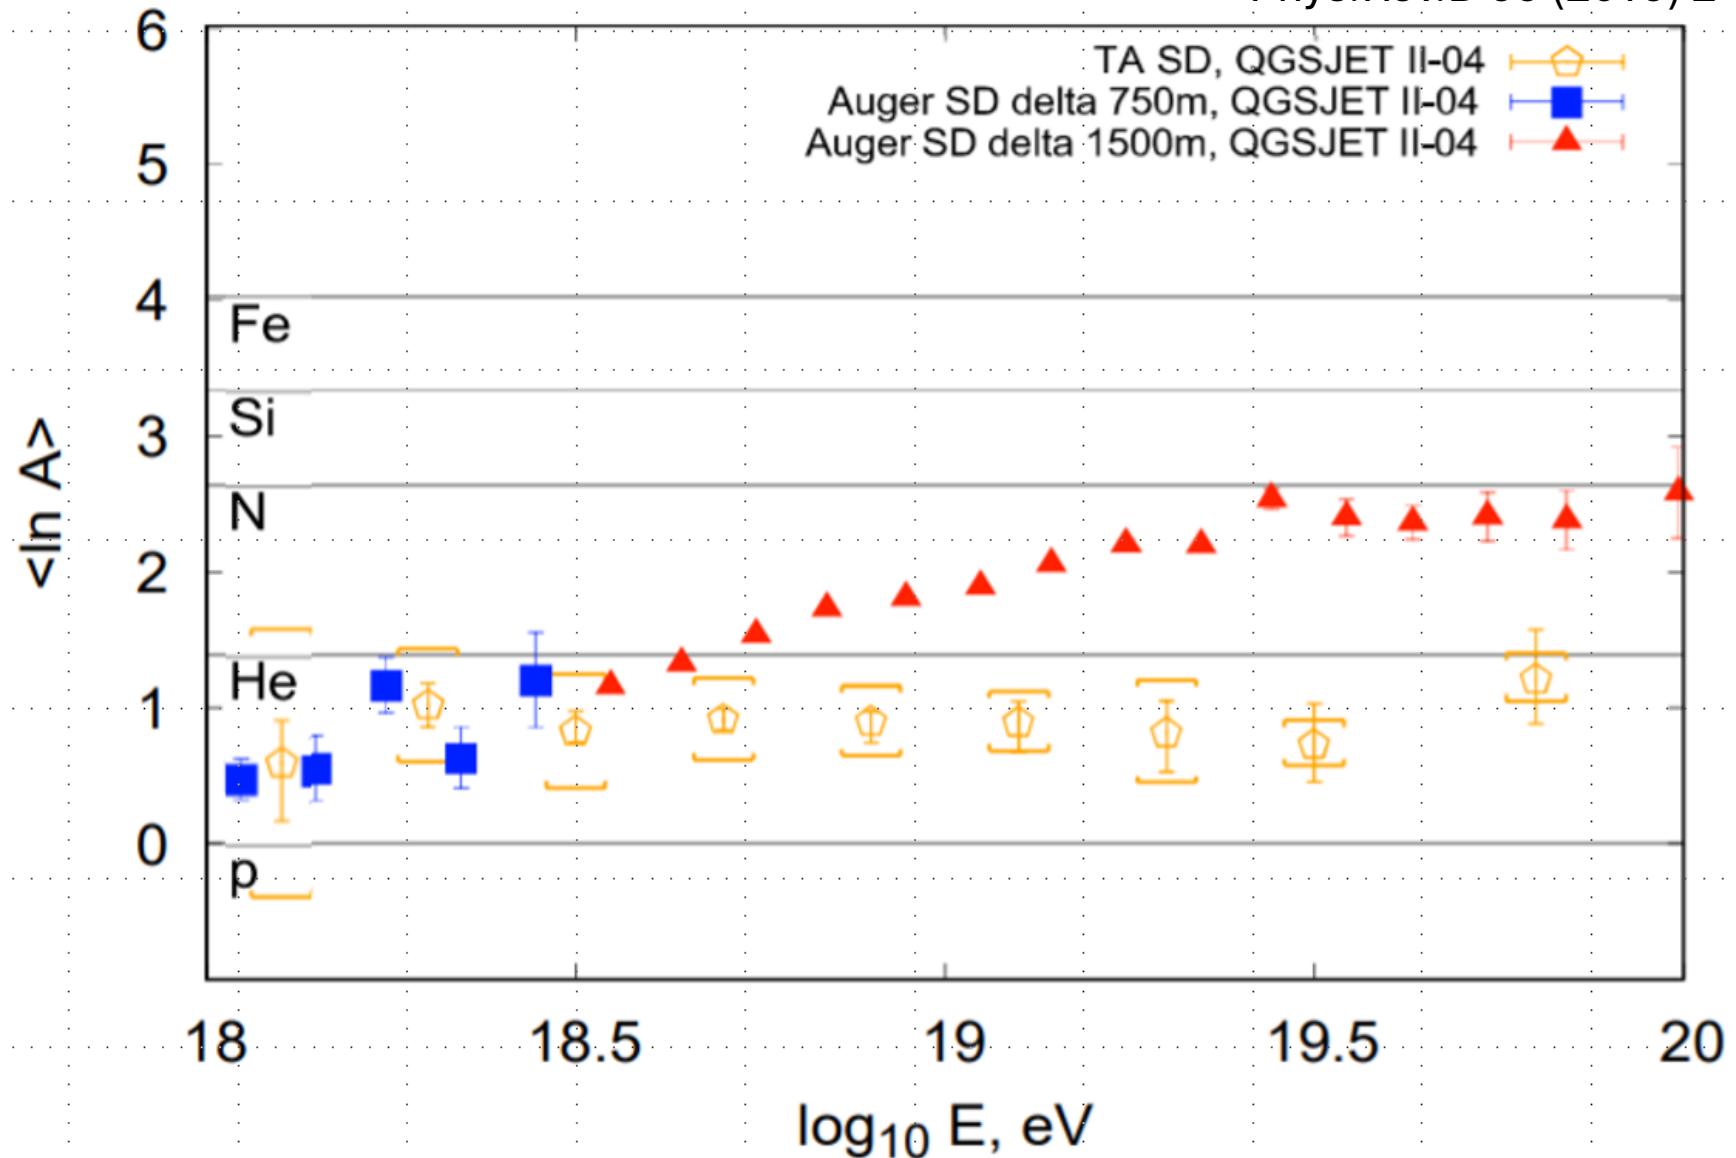

- 10-years FD+SD data
- Agreement with light composition up to 1019.1 eV
- Need more data for higher energies

# SD Composition Study

Y. Zhezher, ICRC2021  
Phys.Rev.D 99 (2019) 2

- SD data, composition-sensitive parameters like Linsley curvature, number of peaks in traces,
- BDT classifier

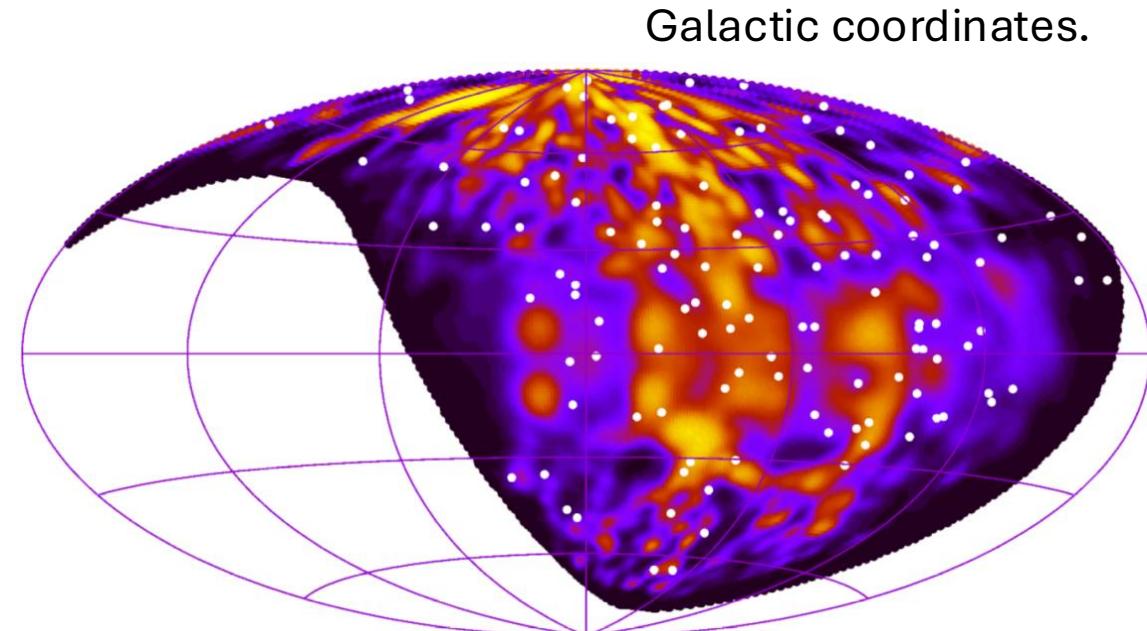

# Implication of mass composition from the arrival direction distribution

- Use 2MRS galaxy map as the tracer of LSS-mass distribution
- Introduce the *smearing angle*  $\theta$  to blurr the cosmic ray source due to the magnetic field
- Employ a *flux sampling method* and compare the TA data in terms of the test statistic,

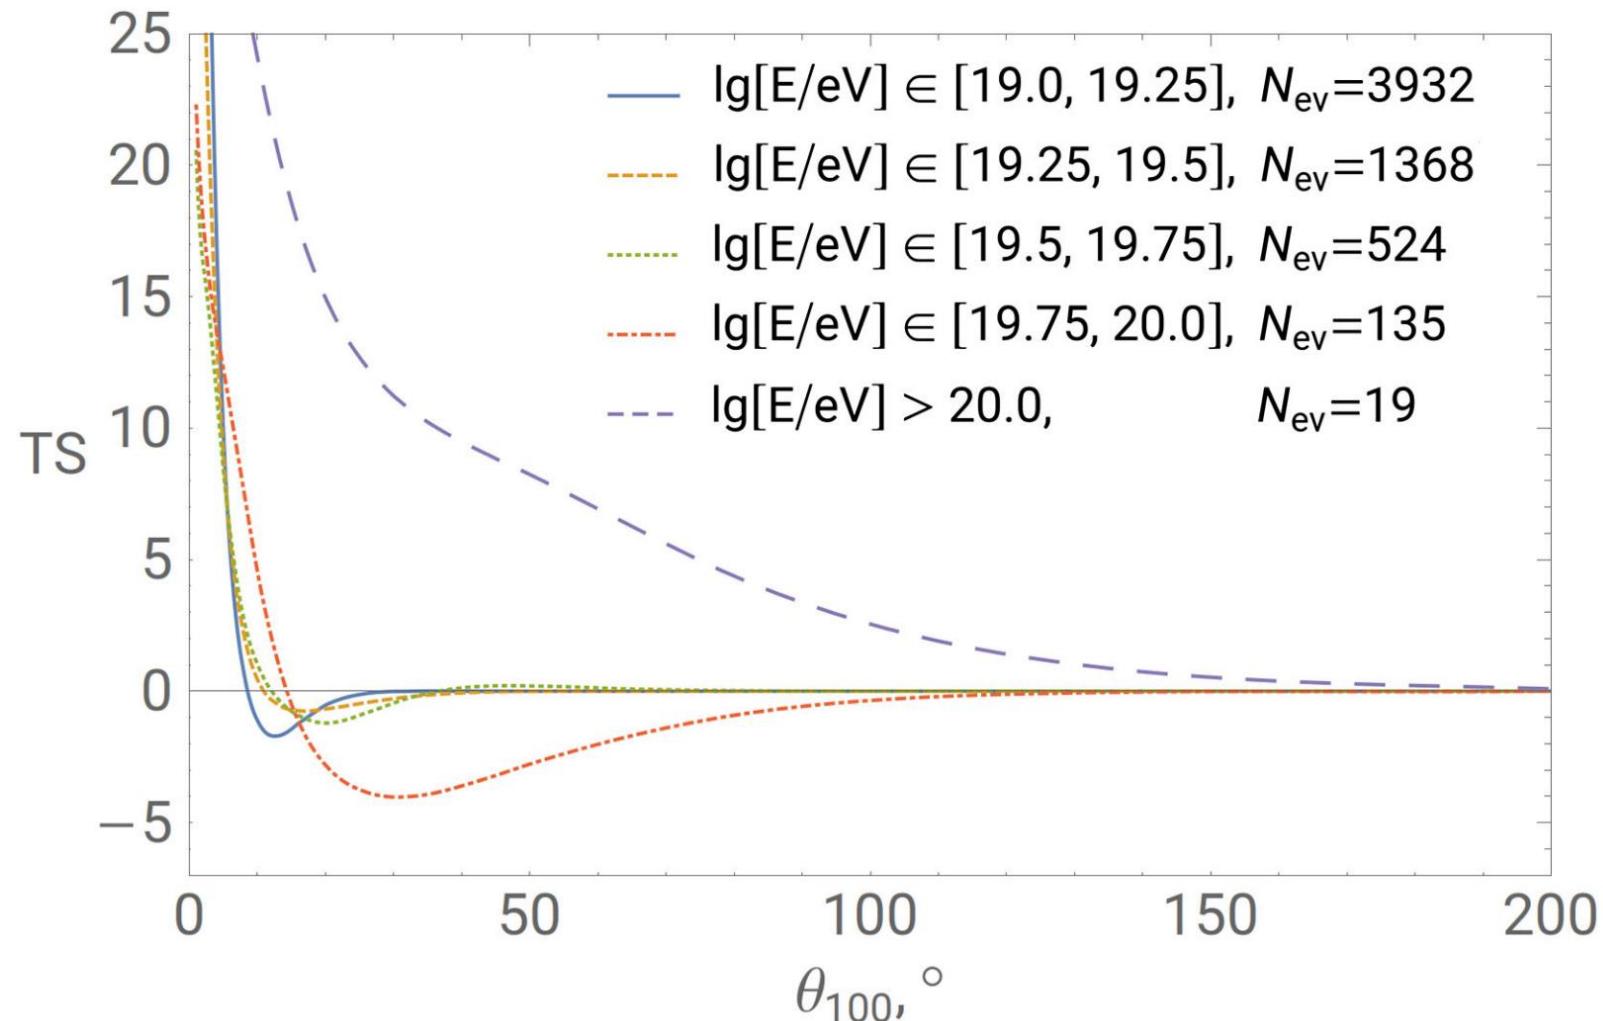

$$TS(\theta_{100}) = -2 \sum_k \left( \sum_i \ln \frac{\Phi_k(\theta_{100}, \mathbf{n}_i)}{\Phi_{\text{iso}}(\mathbf{n}_i)} \right).$$

- $\mathbf{n}_i$ :  $i$ -th TA event direction
- $\theta = \theta_{100}/E_k$
- $\theta_{100}$ : Smearing angle at 100EeV

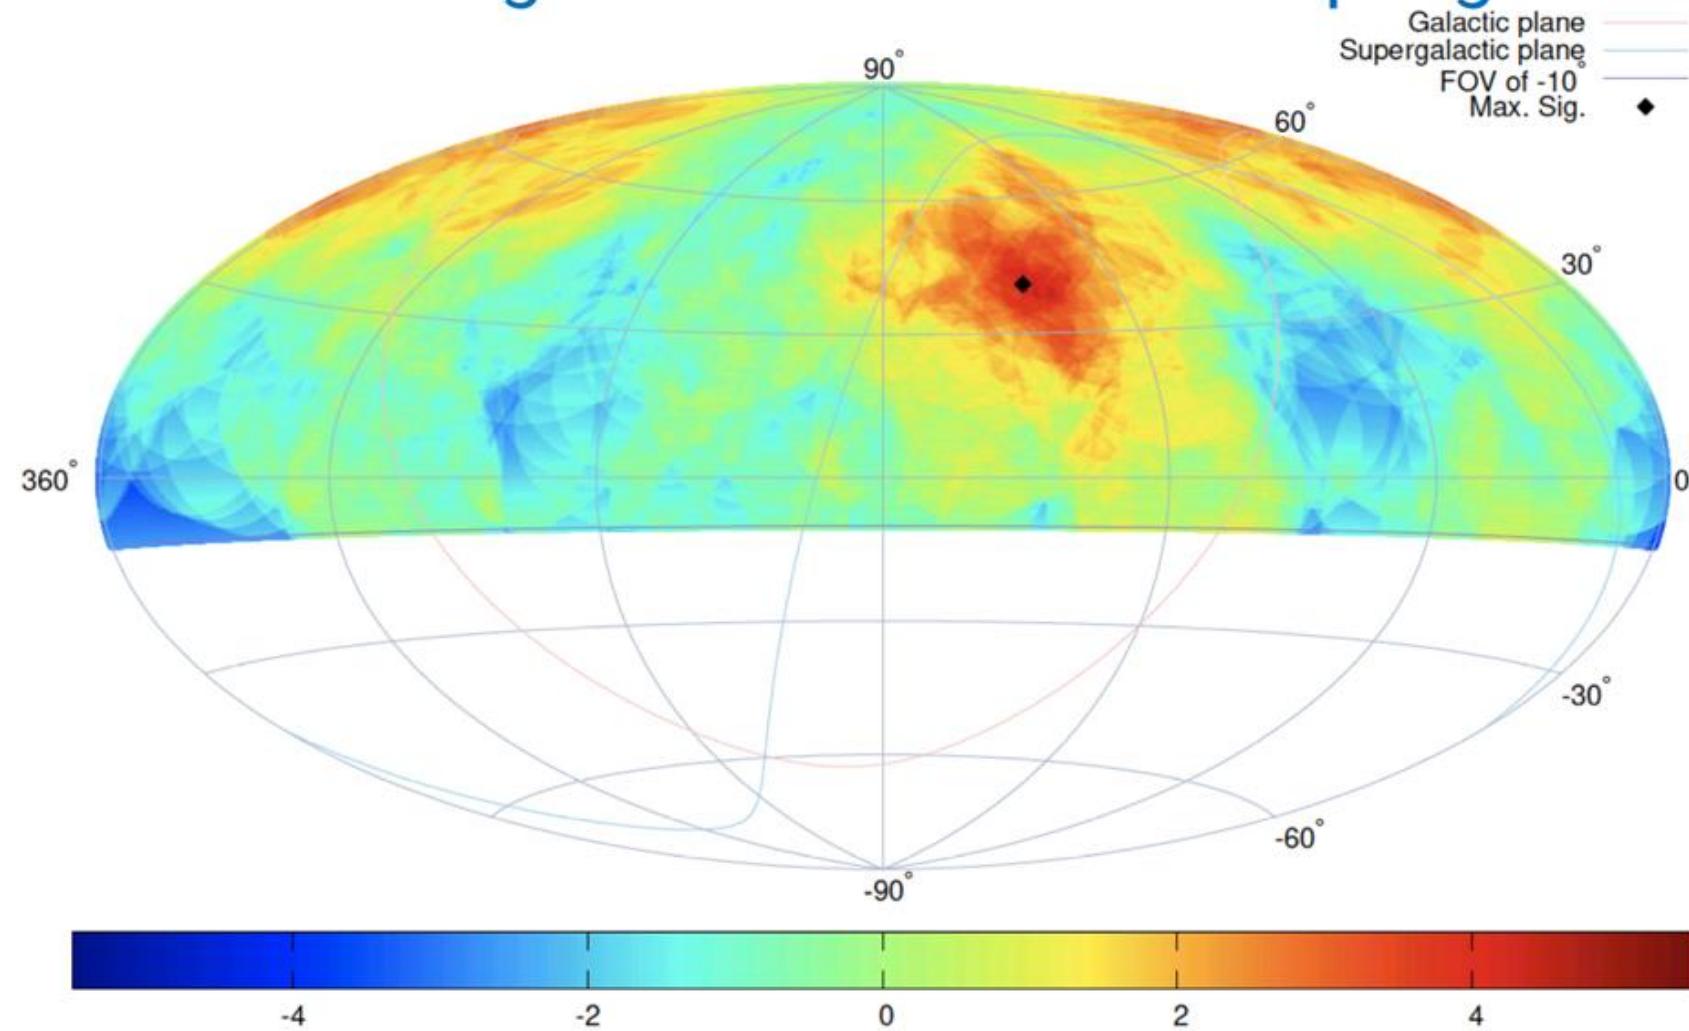

# TA highest energy SD events are isotropic

- Small deflections ( $< 10^\circ$ ) is not compatible at all energies
- $\Theta_{100}^{\min}$  found around 10-30 degrees below  $\log E < 20$ : Compatible with LSS at  $2\sigma$  level
- Prefers complete isotropy for  $\log E > 20$ , which implies heavy composition at the highest energies

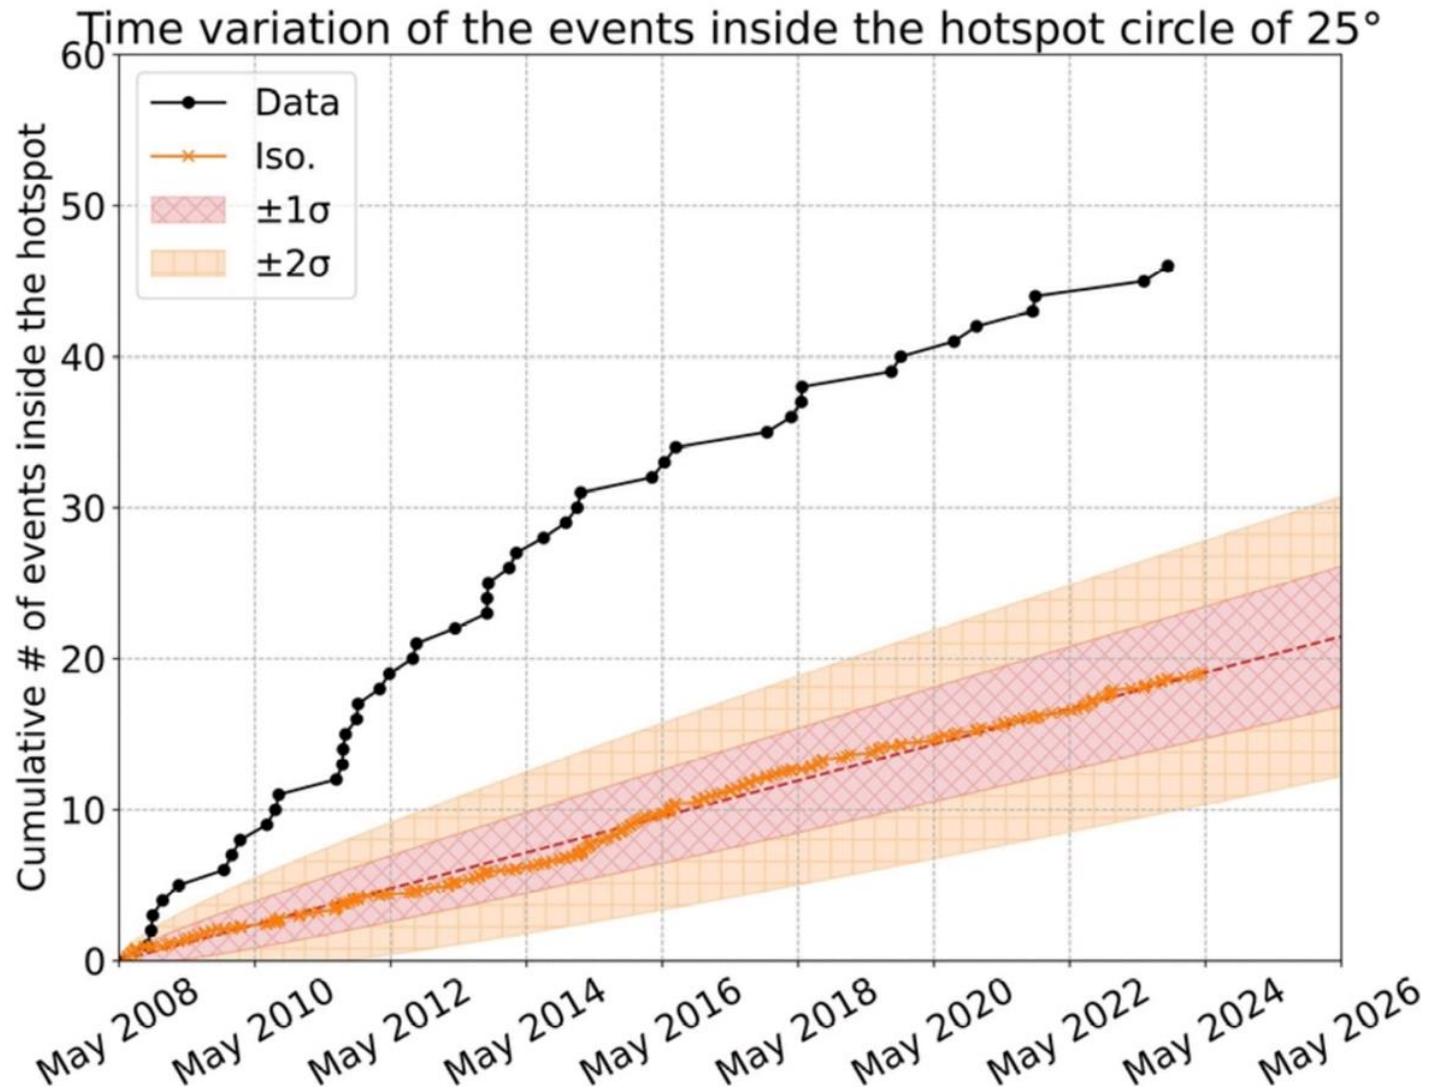

# TA Hot Spot

25° angular distance oversampling

- $E > 57$  EeV, 228 events
- Local significance 4.9 sigmas at (144.0, 40.5)
  - Nobs: 46
  - Nexp: 19.1
- Global significance 2.9 sigmas

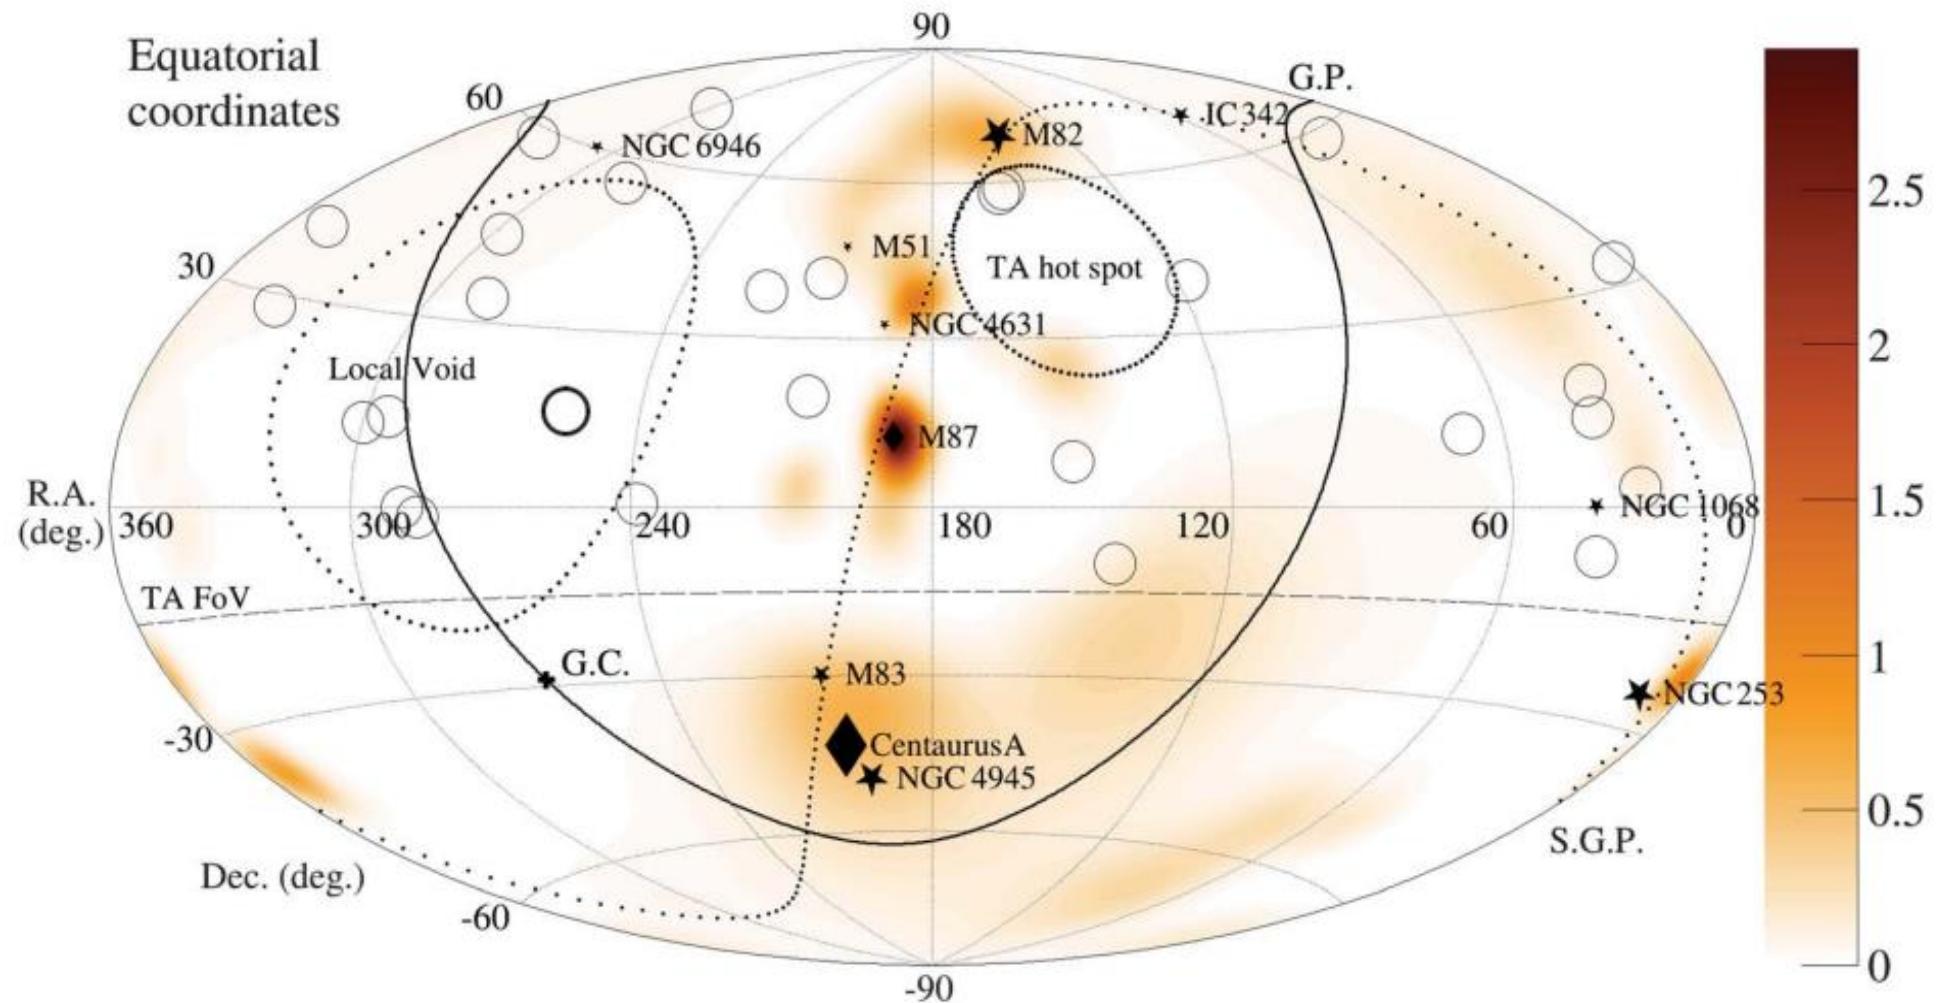

# TA Hot Spot Is Still Hot

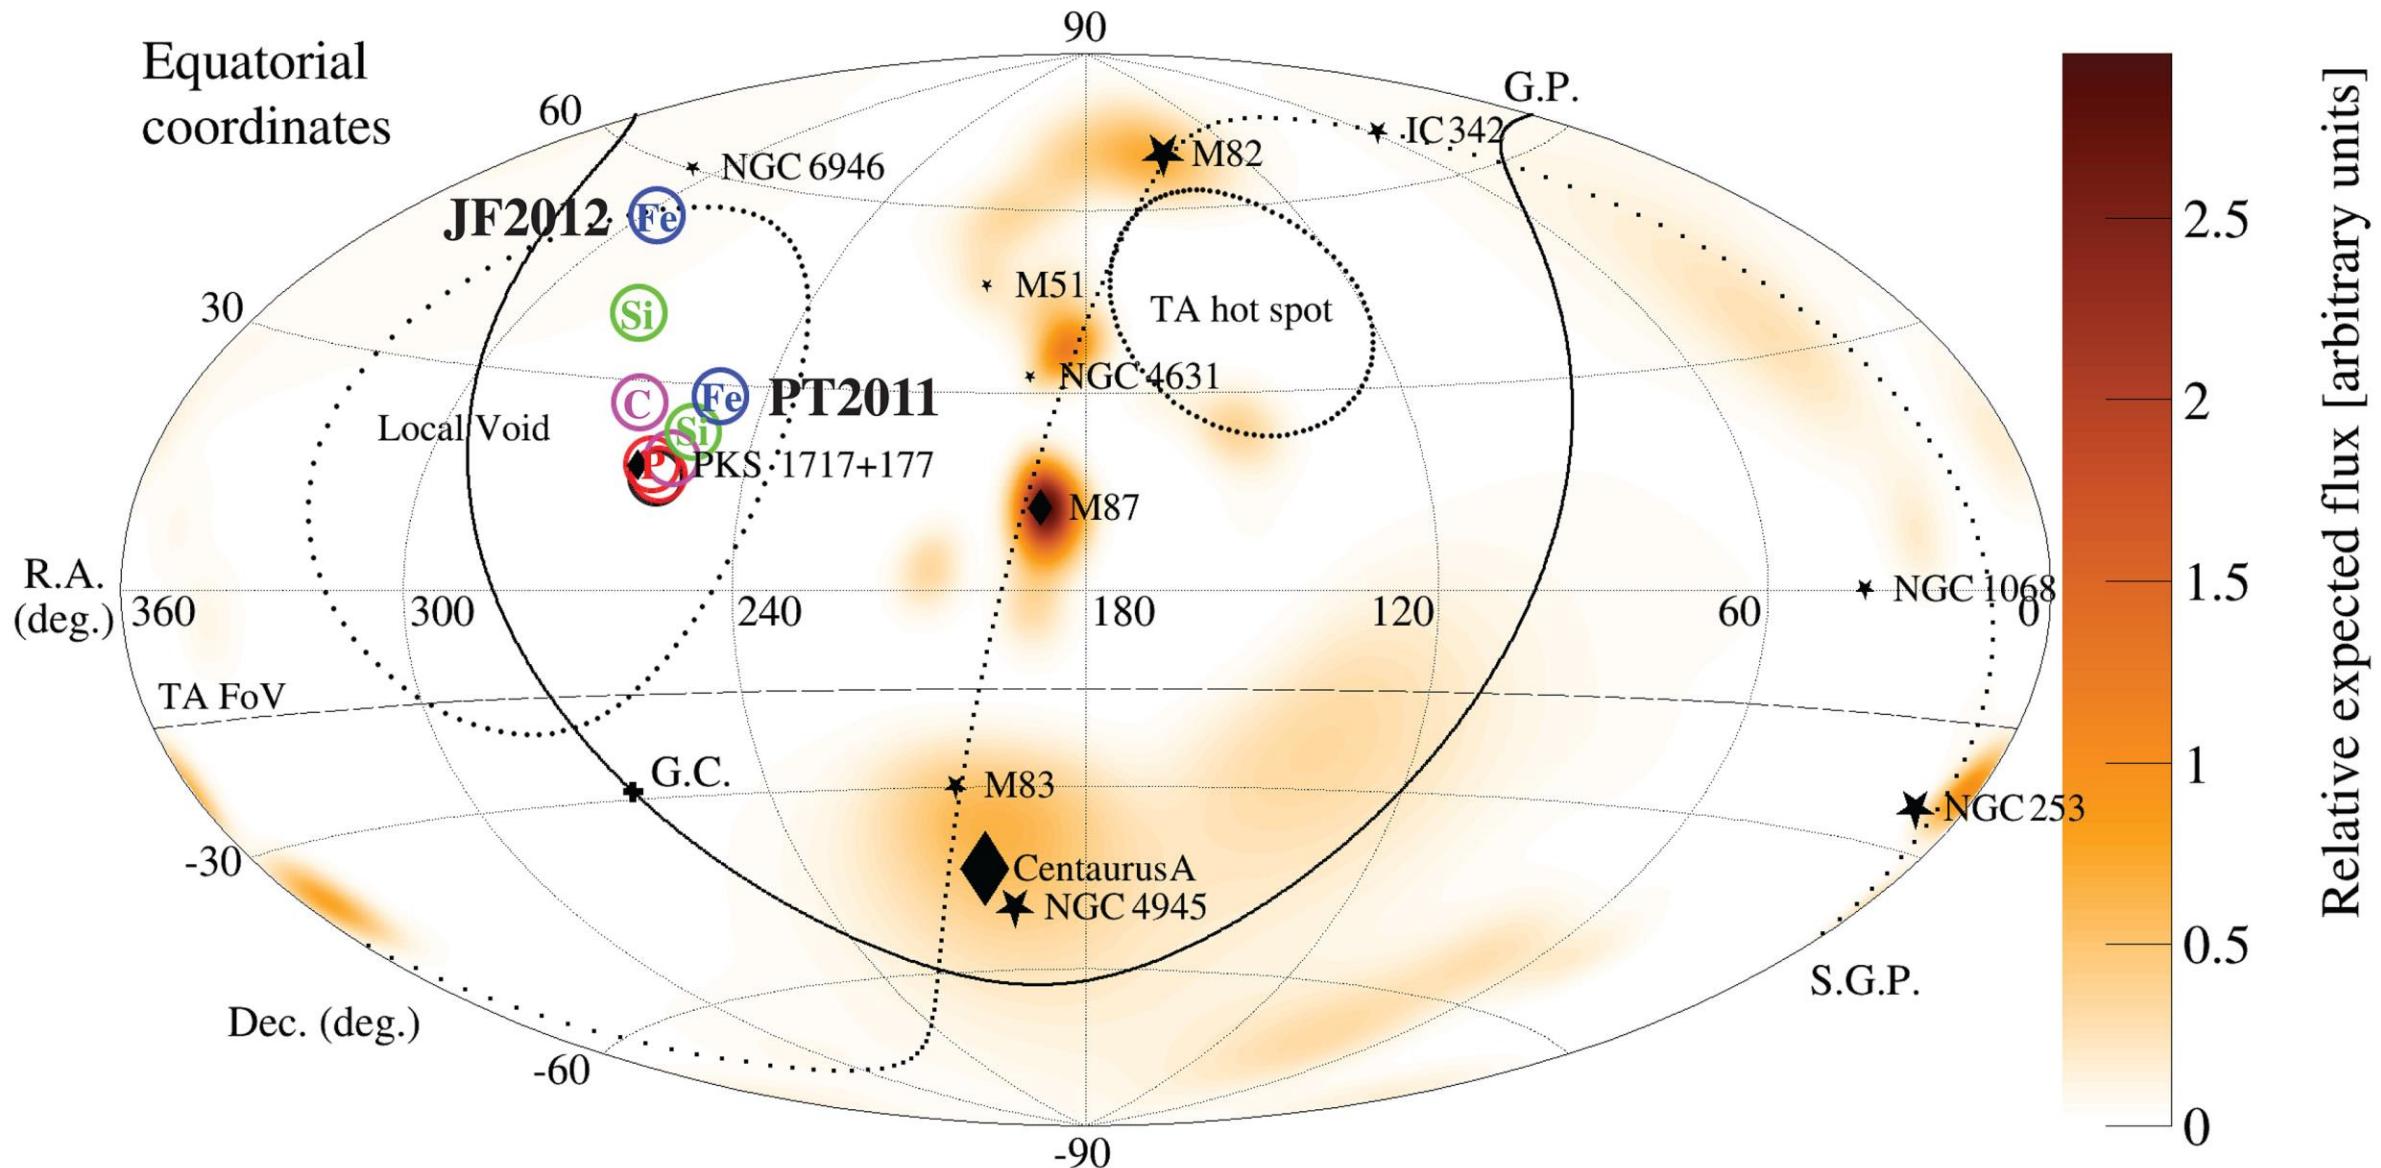

# Amateras is uncorrelated with LSS

Telescope Array Collaboration,  
Science 382, 903–907 (2023)

**Fig. 3. Arrival directions of all >100-EeV cosmic rays.** Empty circles indicate the arrival directions of all cosmic rays observed by TA SD over 13.5 years of operation that had energies >100 EeV. The background and other symbols are the same as in Fig. 2. No clustering around the highest-energy event (thick circle) is evident.

# Amateras is uncorrelated with LSS

# Summary

- TA is operational more than 16 years since 2008
- Energy spectrum updated
  - Highest-energy steepening at  $\log E = 19.83$ , 6.3 sigmas
  - "Instep" structure confirmed at  $\log E = 19.15$ , 5.2 sigmas
  - Good agreement with Auger for  $\log E < 19.5$
  - Northern/southern sky tension
- Composition studies
  - "Light" composition up to  $10^{19.1}$  eV by FD,  $10^{19.7}$  by SD
  - Heavy composition favors from the arrival direction distribution for  $E > 10^{20}$  eV
- TA hotspot is still hot at (144.0, 40.5) for  $E > 57$  EeV
- Amateras particle
  - May 27, 2021
  - 244 EeV, the 2nd highest energy all the time, the highest energy event detected by an SD array
  - No FD data
  - Identification of the primary particle type ongoing
