Cosmic Rays and Neutrinos in the Multi-Messenger Era 2024 (Paris, France) Dec 2024

# THE HIGH-ENERGY SKY IS DYNAMIC!

Fermi-LAT all-sky (north/south) timelapse

# REALTIME SEARCHES FOR NEUTRINO EMITTERS

Main source type unclear

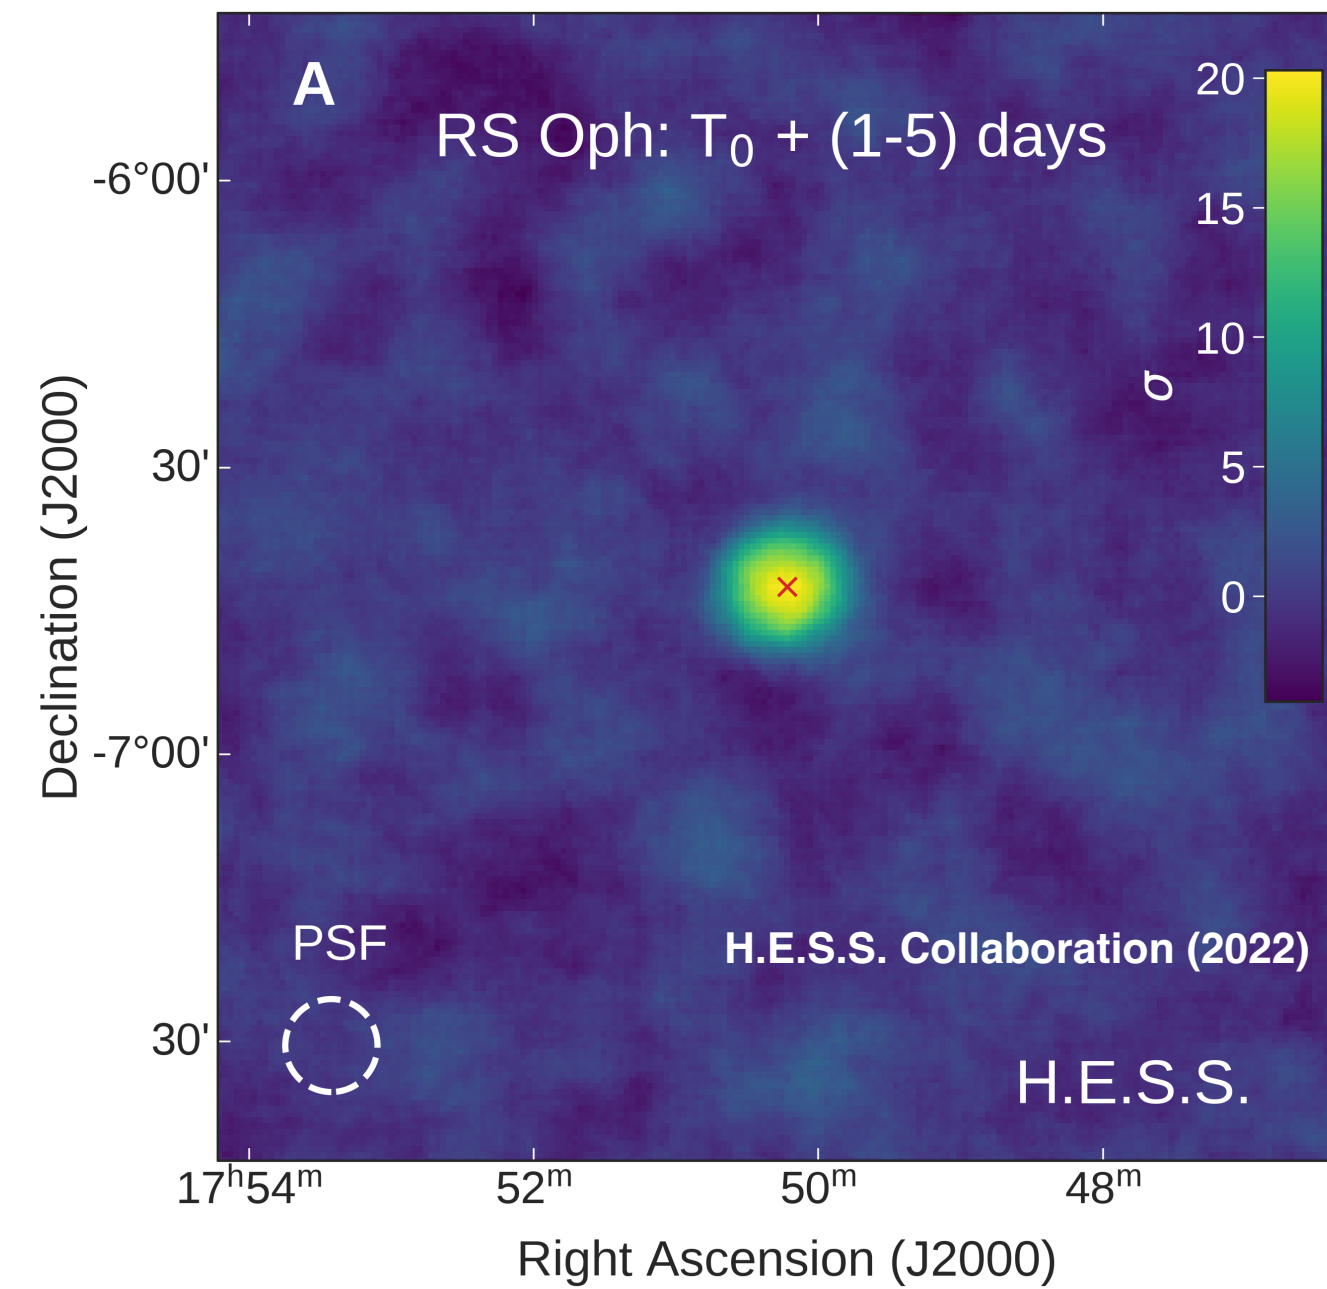

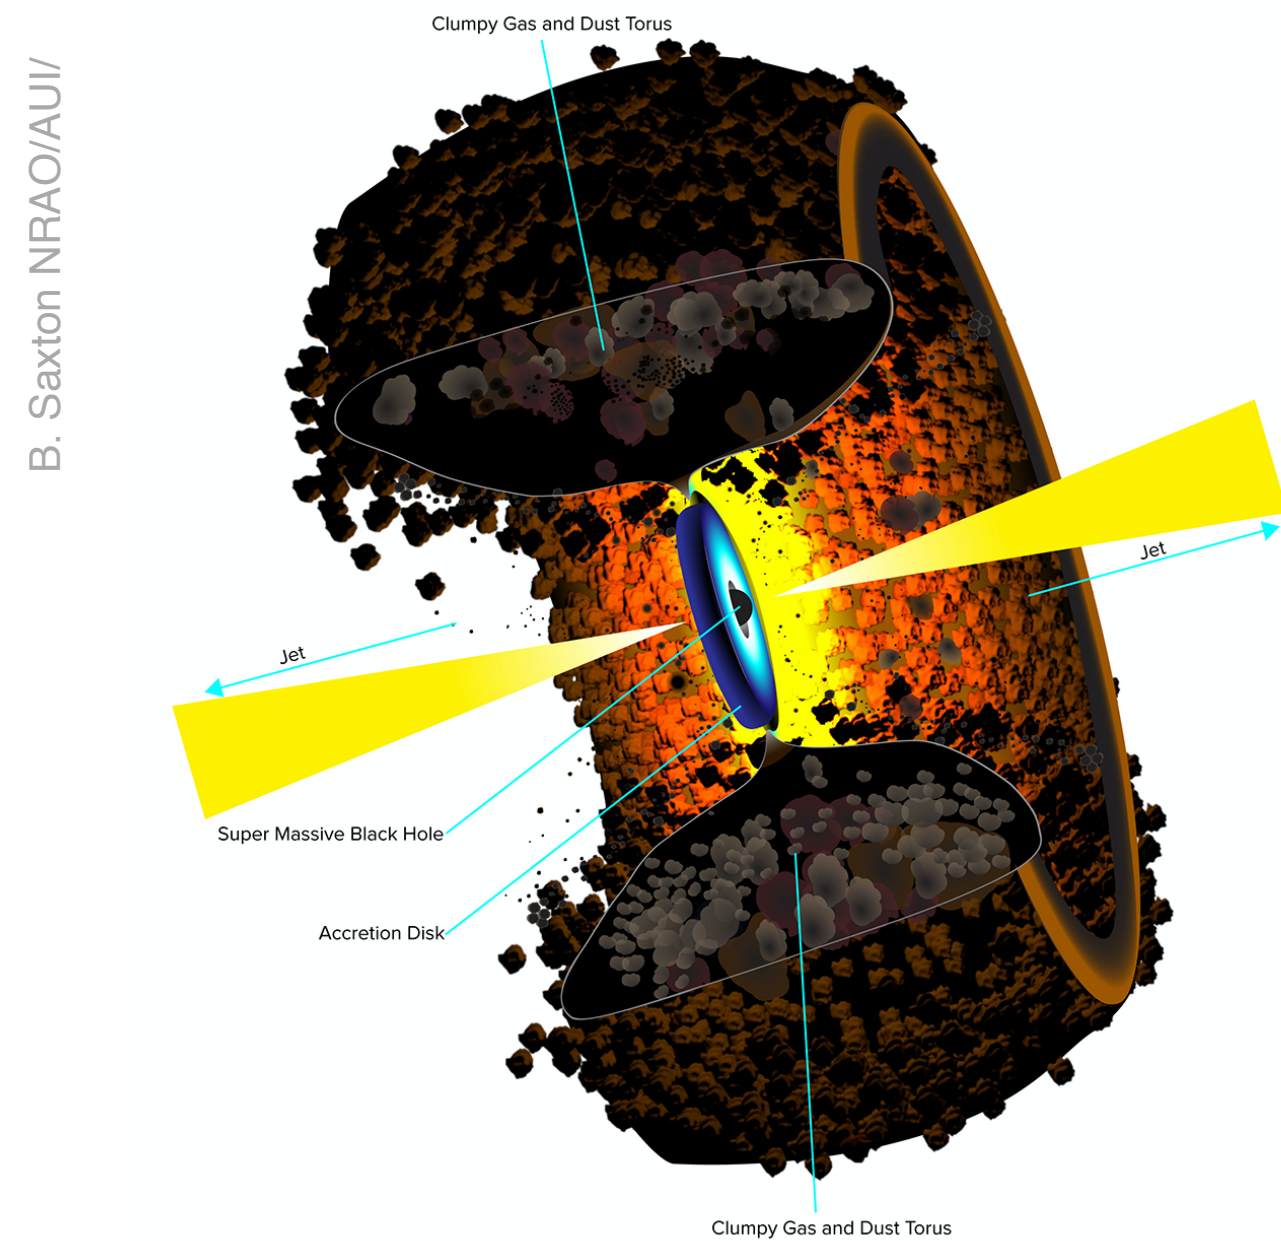

Timescale unclear  
(Seconds to steady emission)

Energy range unclear  
(Radio? X-rays? Gammas?)

All-sky distribution!

# PROBING PARTICLE ACCELERATION WITH NEUTRINOS

## • Active Galactic Nuclei

- Observed across the EM spectrum up to multi-TeV energies.
- Origin of highest-energy emission uncertain: can be explained by leptonic and hadronic processes.
- Origin of Ultra-High-Energy Cosmic Rays

## • Galactic hadronic accelerators

- Signatures of hadronic emission have also been observed in transient sources such as novae.
- Extreme energies reached by Galactic sources, up to PeV, challenging to explain in a leptonic scenario.
- Galactic cosmic-ray origin

Neutrinos are the telltale sign of hadronic particle acceleration

# CURRENT OBSERVATIONAL STATUS FOR NEUTRINOS

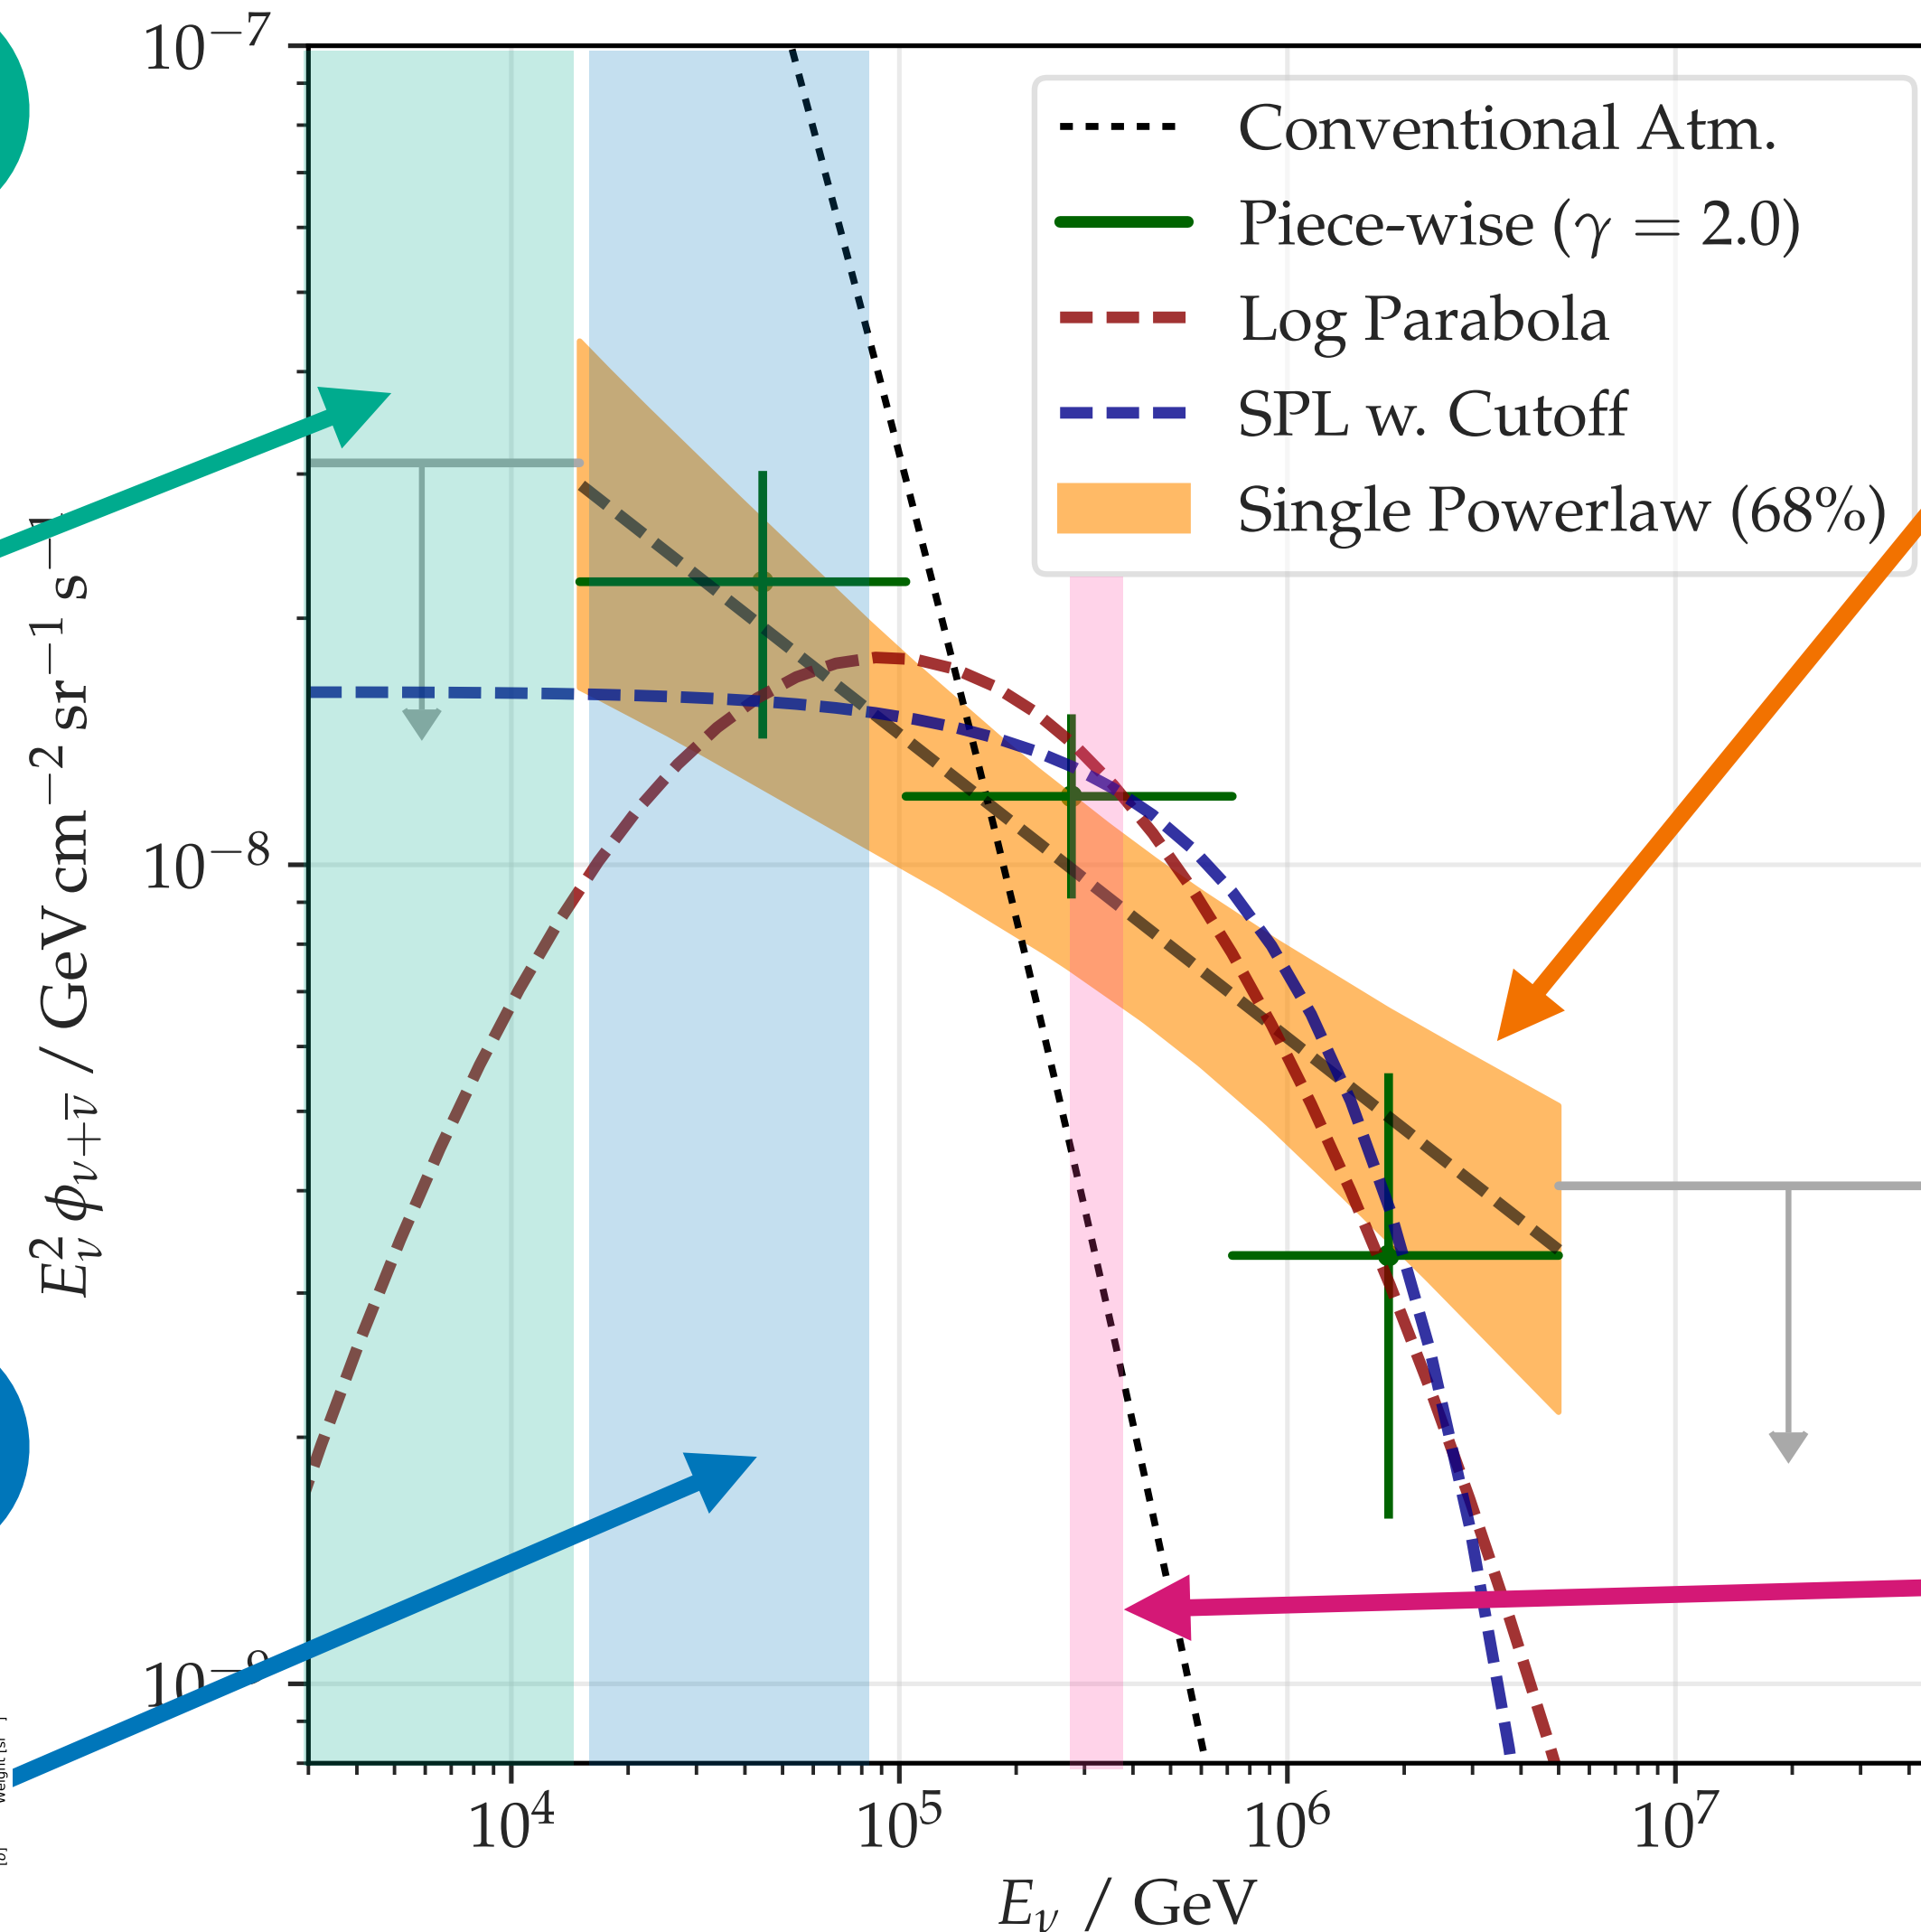

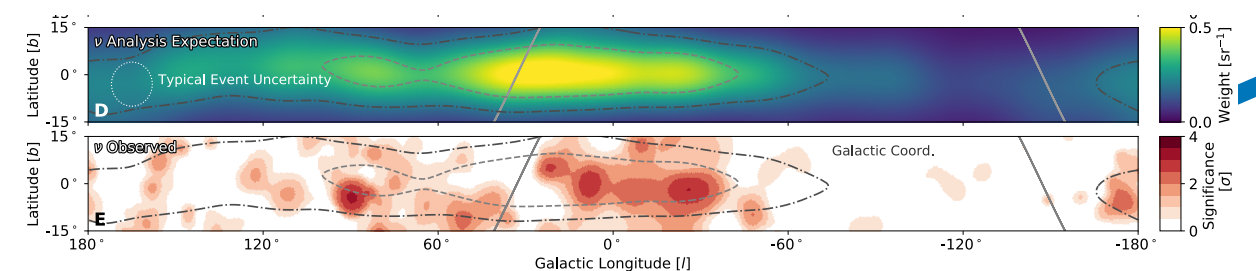

## Neutrino emission from an AGN (2022)

3

## Neutrinos from the Milky Way (2023)

4

IceCube 2021 (arXiv/2111.10299)

## Astrophysical neutrino flux (2013)

1

## Evidence for $\nu + \gamma$ emission from a blazar (2017)

2

IceCube, MAGIC, ++ 2018 (arXiv/1807.08816)

# CURRENT OBSERVATIONAL STATUS FOR NEUTRINOS

## Low-energy regime

- Background dominated
- Sensitivity roughly  $\propto \text{PSF}^2$
- Self-clustering and correlation searches (temporal too)

Data

Cluster search

IceCube 2021 (arXiv/2111.10299)

## High-energy regime

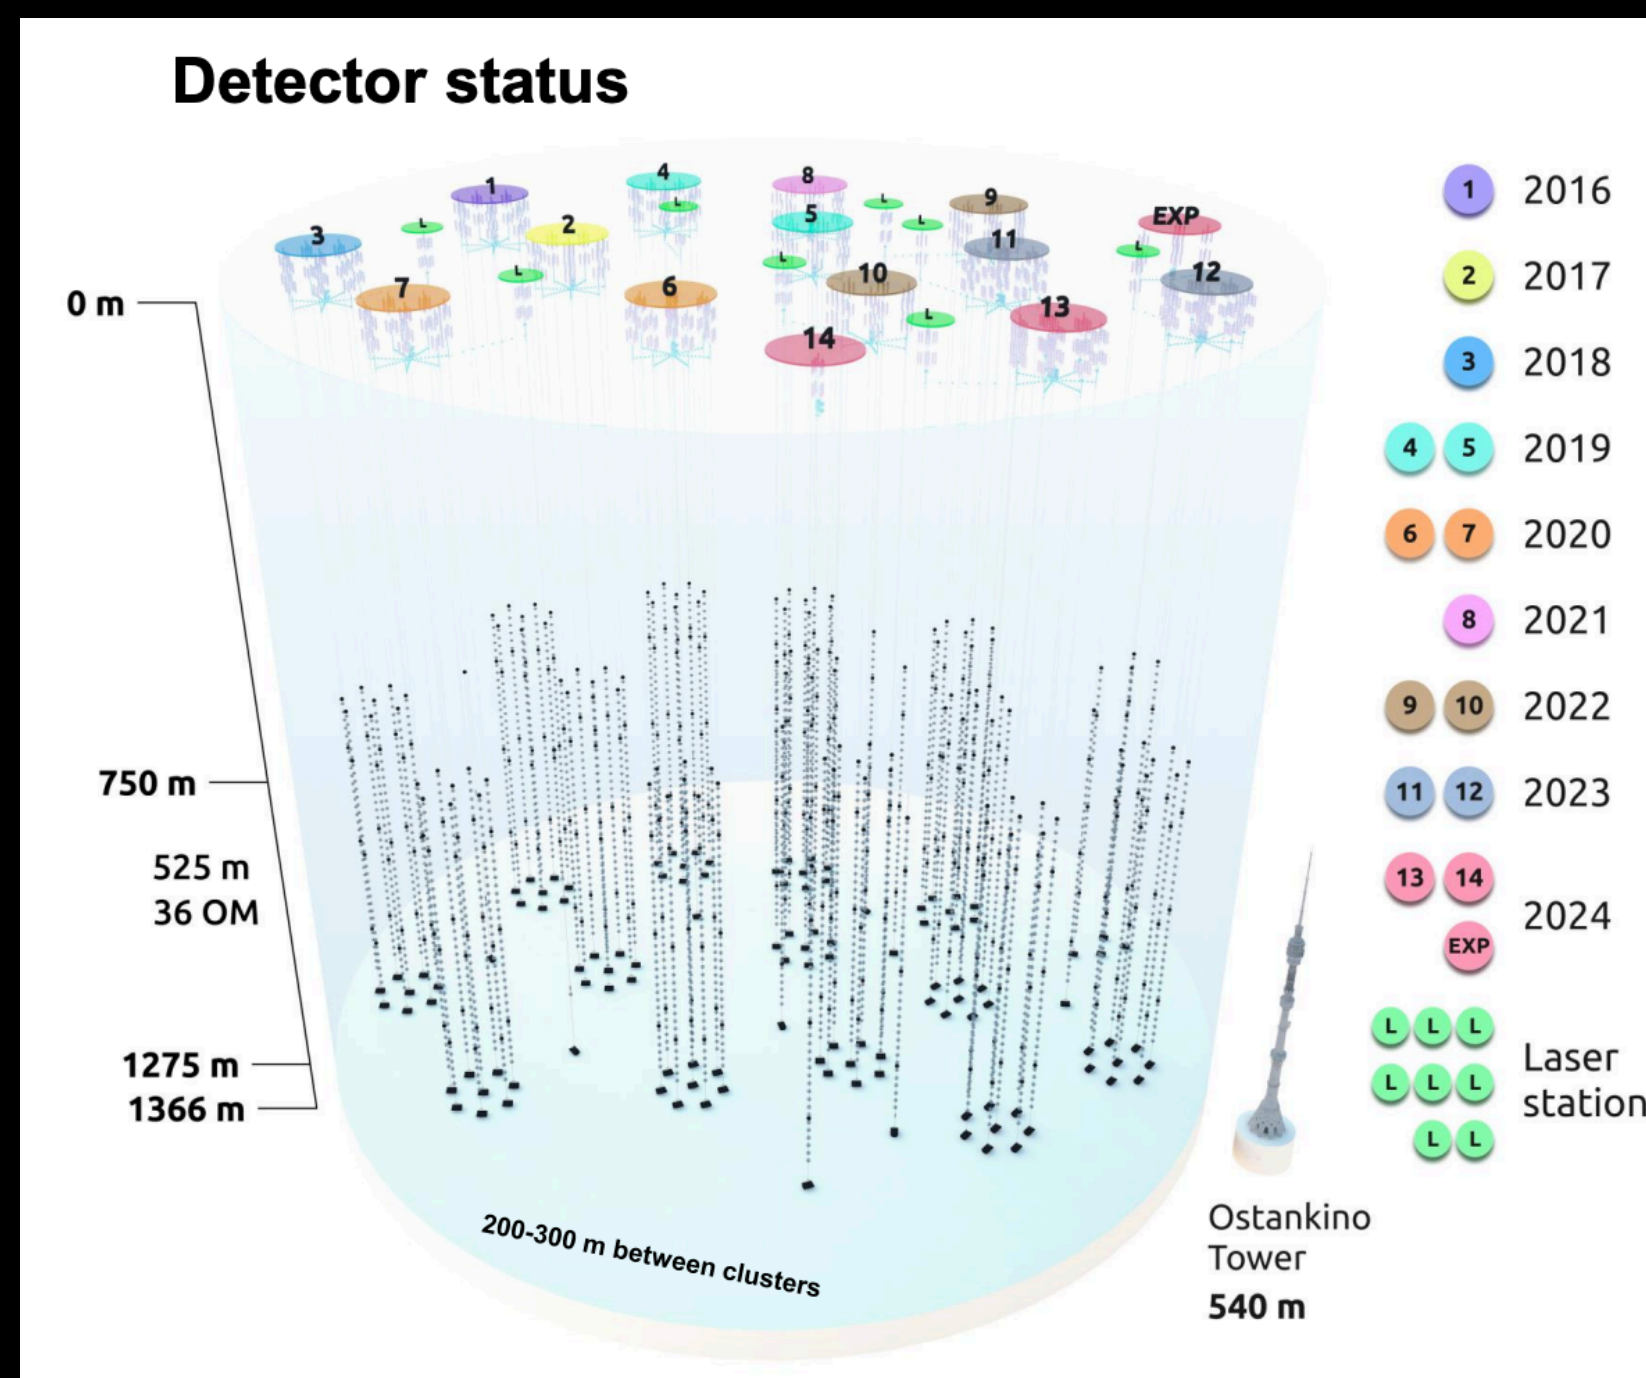

- Signal dominated
- Very low event rate ( $\sim 10$  events per year across the full sky for  $\text{km}^3$  detector)
- Correlation studies
- Realtime follow-ups

IceCube realtime alerts

# CURRENT GENERATION OF NEUTRINO TELESCOPES

## Baikal-GVD

- ▶ Lake Baikal (Russia)
- ▶ Under construction, targeting 1 km<sup>3</sup>
- ▶ As of 2024: 14 clusters with 110 strings total. Talk by Rastislav Dvornicky

## KM3NeT

- ▶ Mediterranean Sea (Italy/France). Successor of ANTARES.
- ▶ Under construction (ORCA/ARCA), targeting 1 km<sup>3</sup>
- ▶ 24+33 detector unit lines operating (see talk by Aart Heijboer)

## IceCube

- ▶ South Pole glacier. 2010.
- ▶ 1 km<sup>3</sup>
- ▶ 5160 PMTs
- ▶ Talk by Erin O'Sullivan

Future: P-ONE, TRIDENT, HUNT, NEON

# THE CHALLENGE OF IDENTIFYING SOURCES

## Low-energy regime

- Background dominated
- Sensitivity roughly  $\propto \text{PSF}^2$
- Self-cluster correlation searches

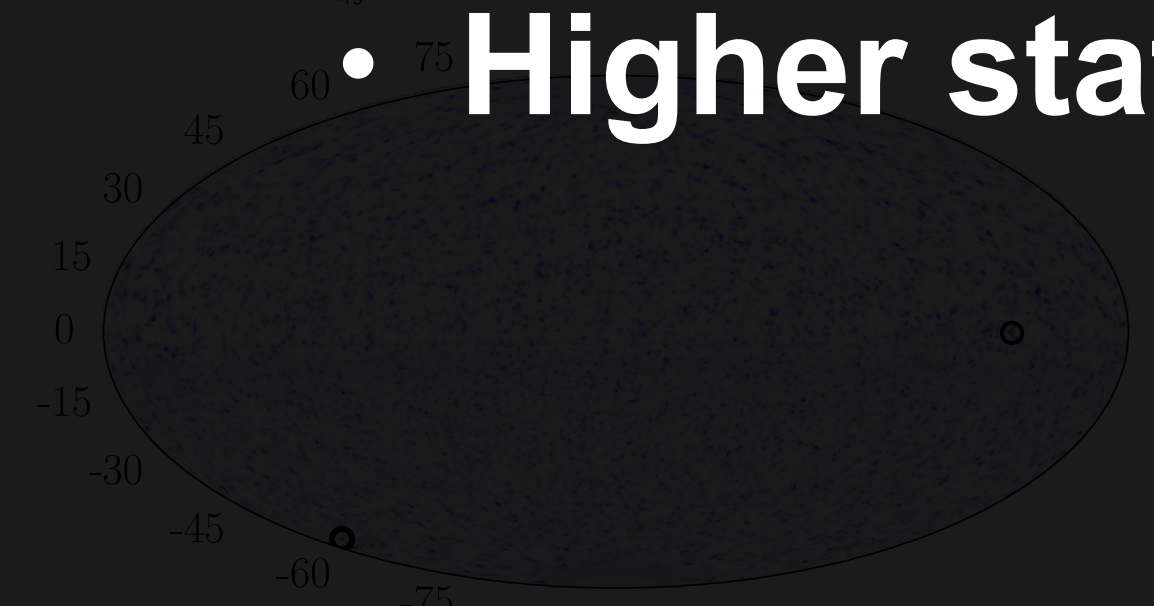

## Requirements for next-generation neutrino telescopes

- Improved sensitivity
- Better angular resolution
- Better background rejection
- Higher statistics

Data

Cluster search

IceCube 2021 (arXiv/2111.10299)

## High-energy regime

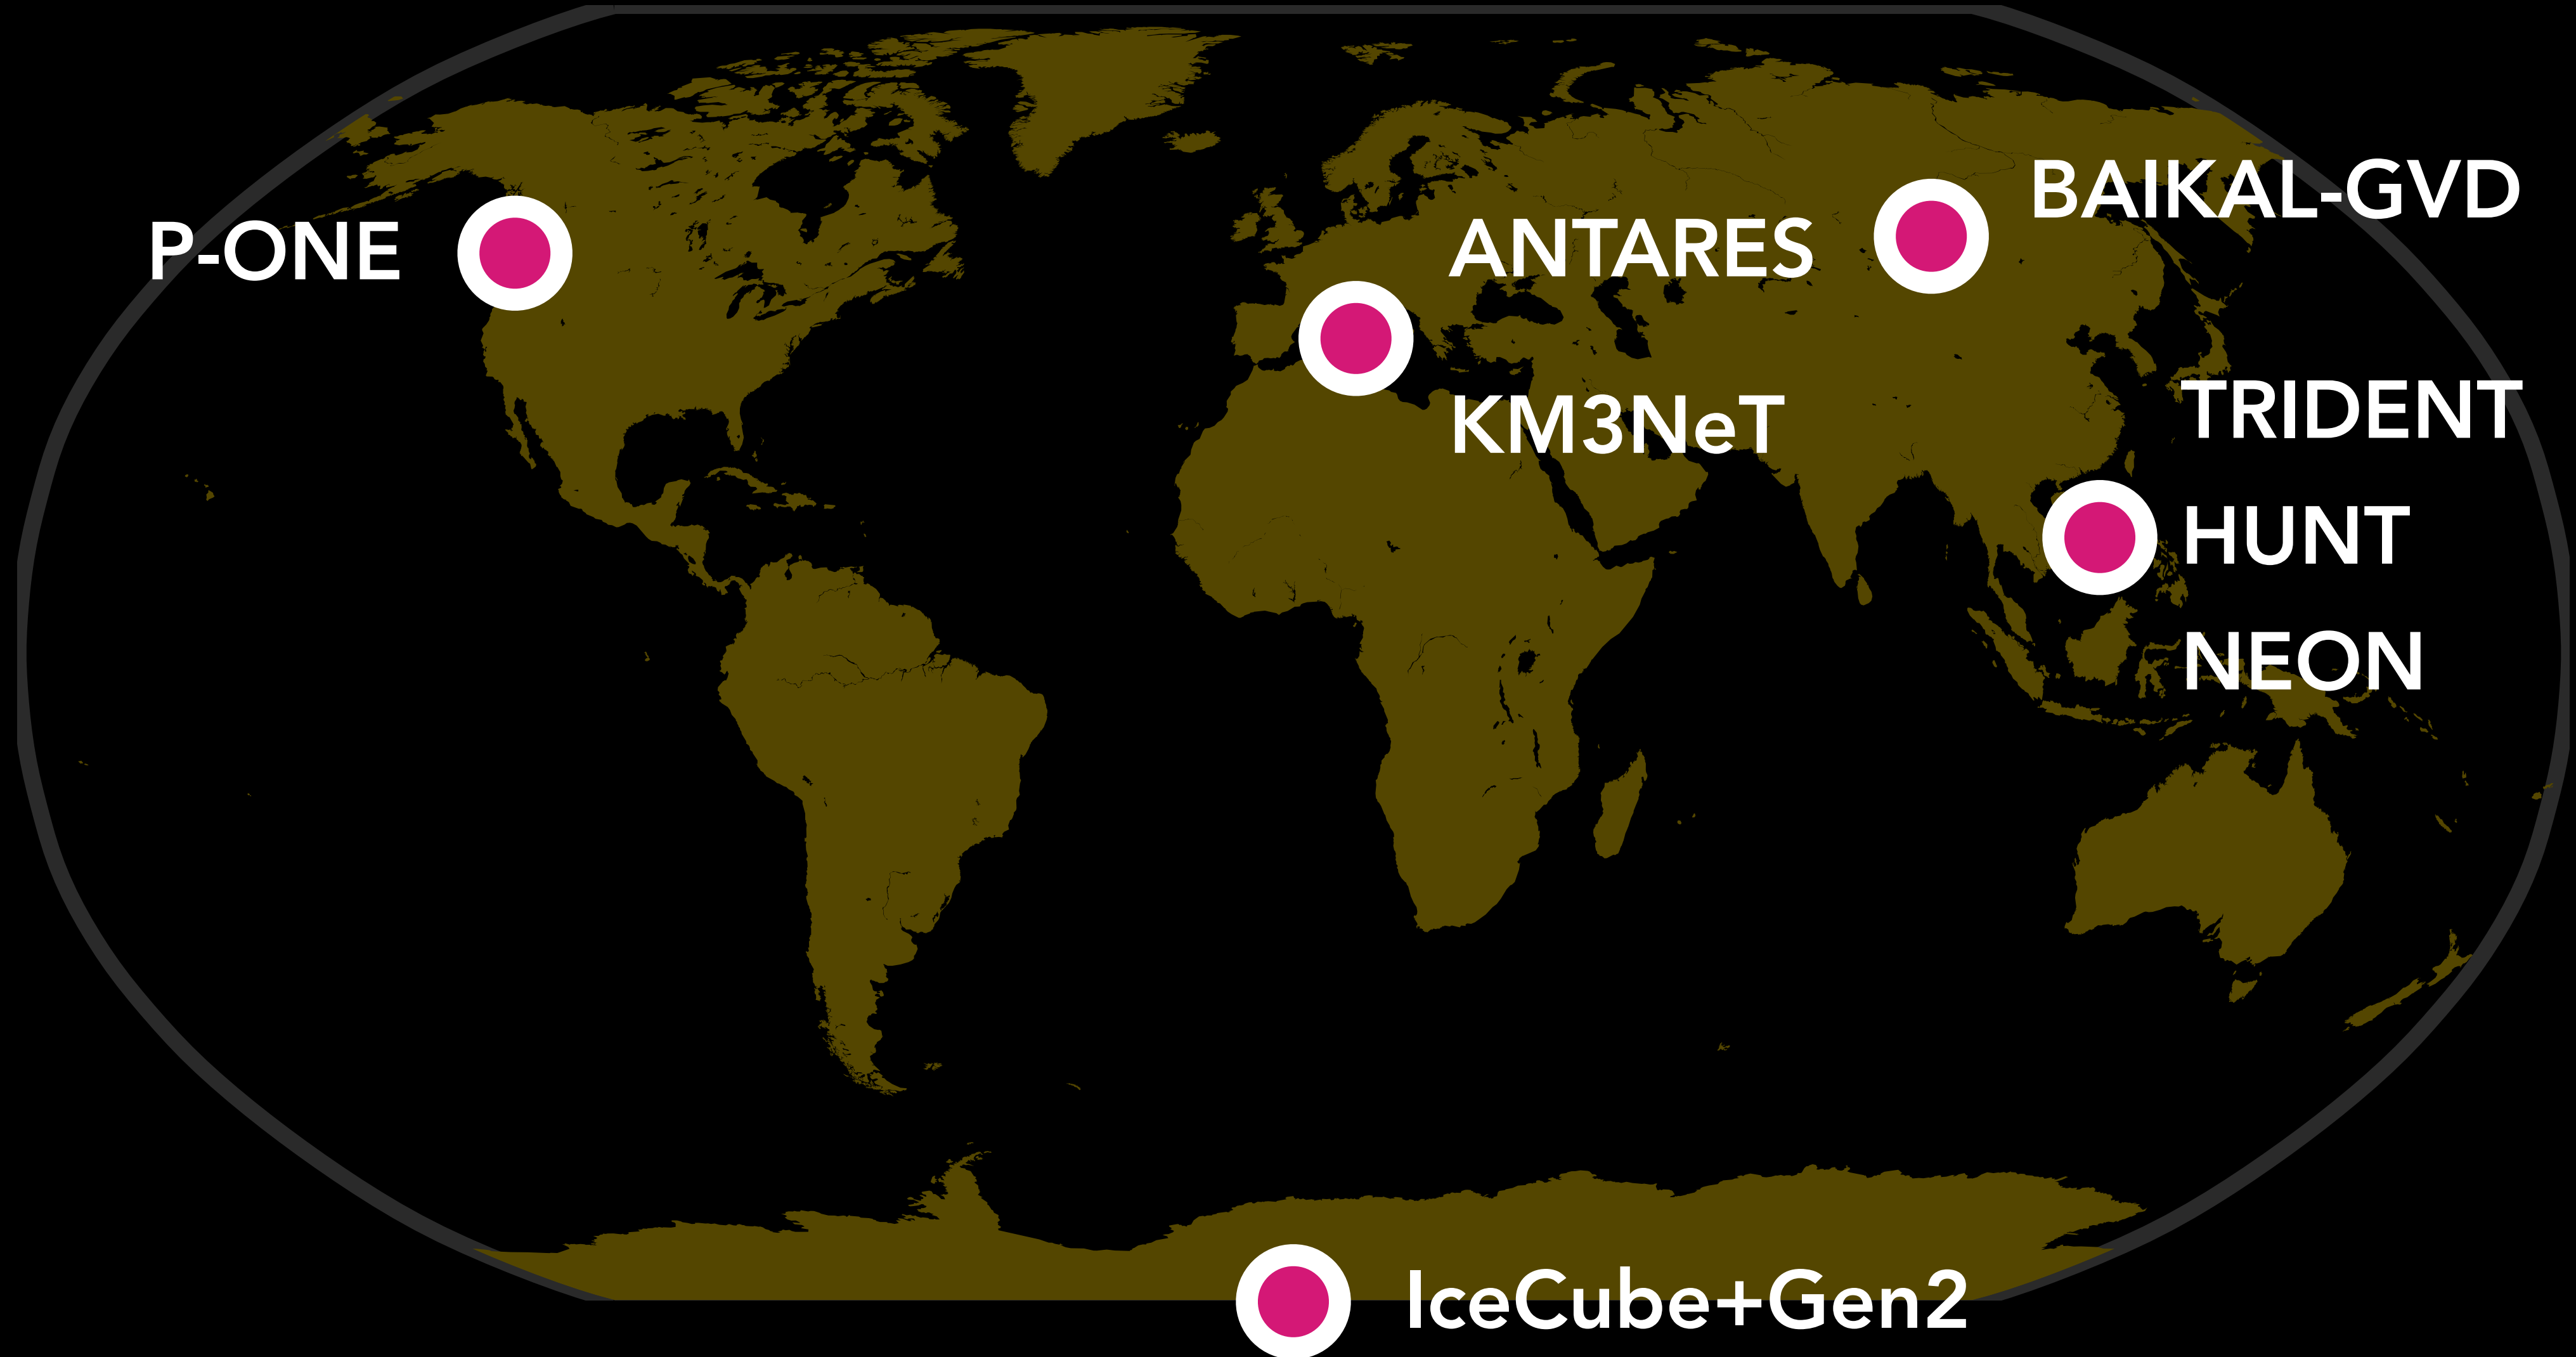

- Signal dominated
- Very low event rate ( $\sim 10$  events per year across the full sky)
- Correlation studies
- Realtime follow-ups

IceCube realtime alerts

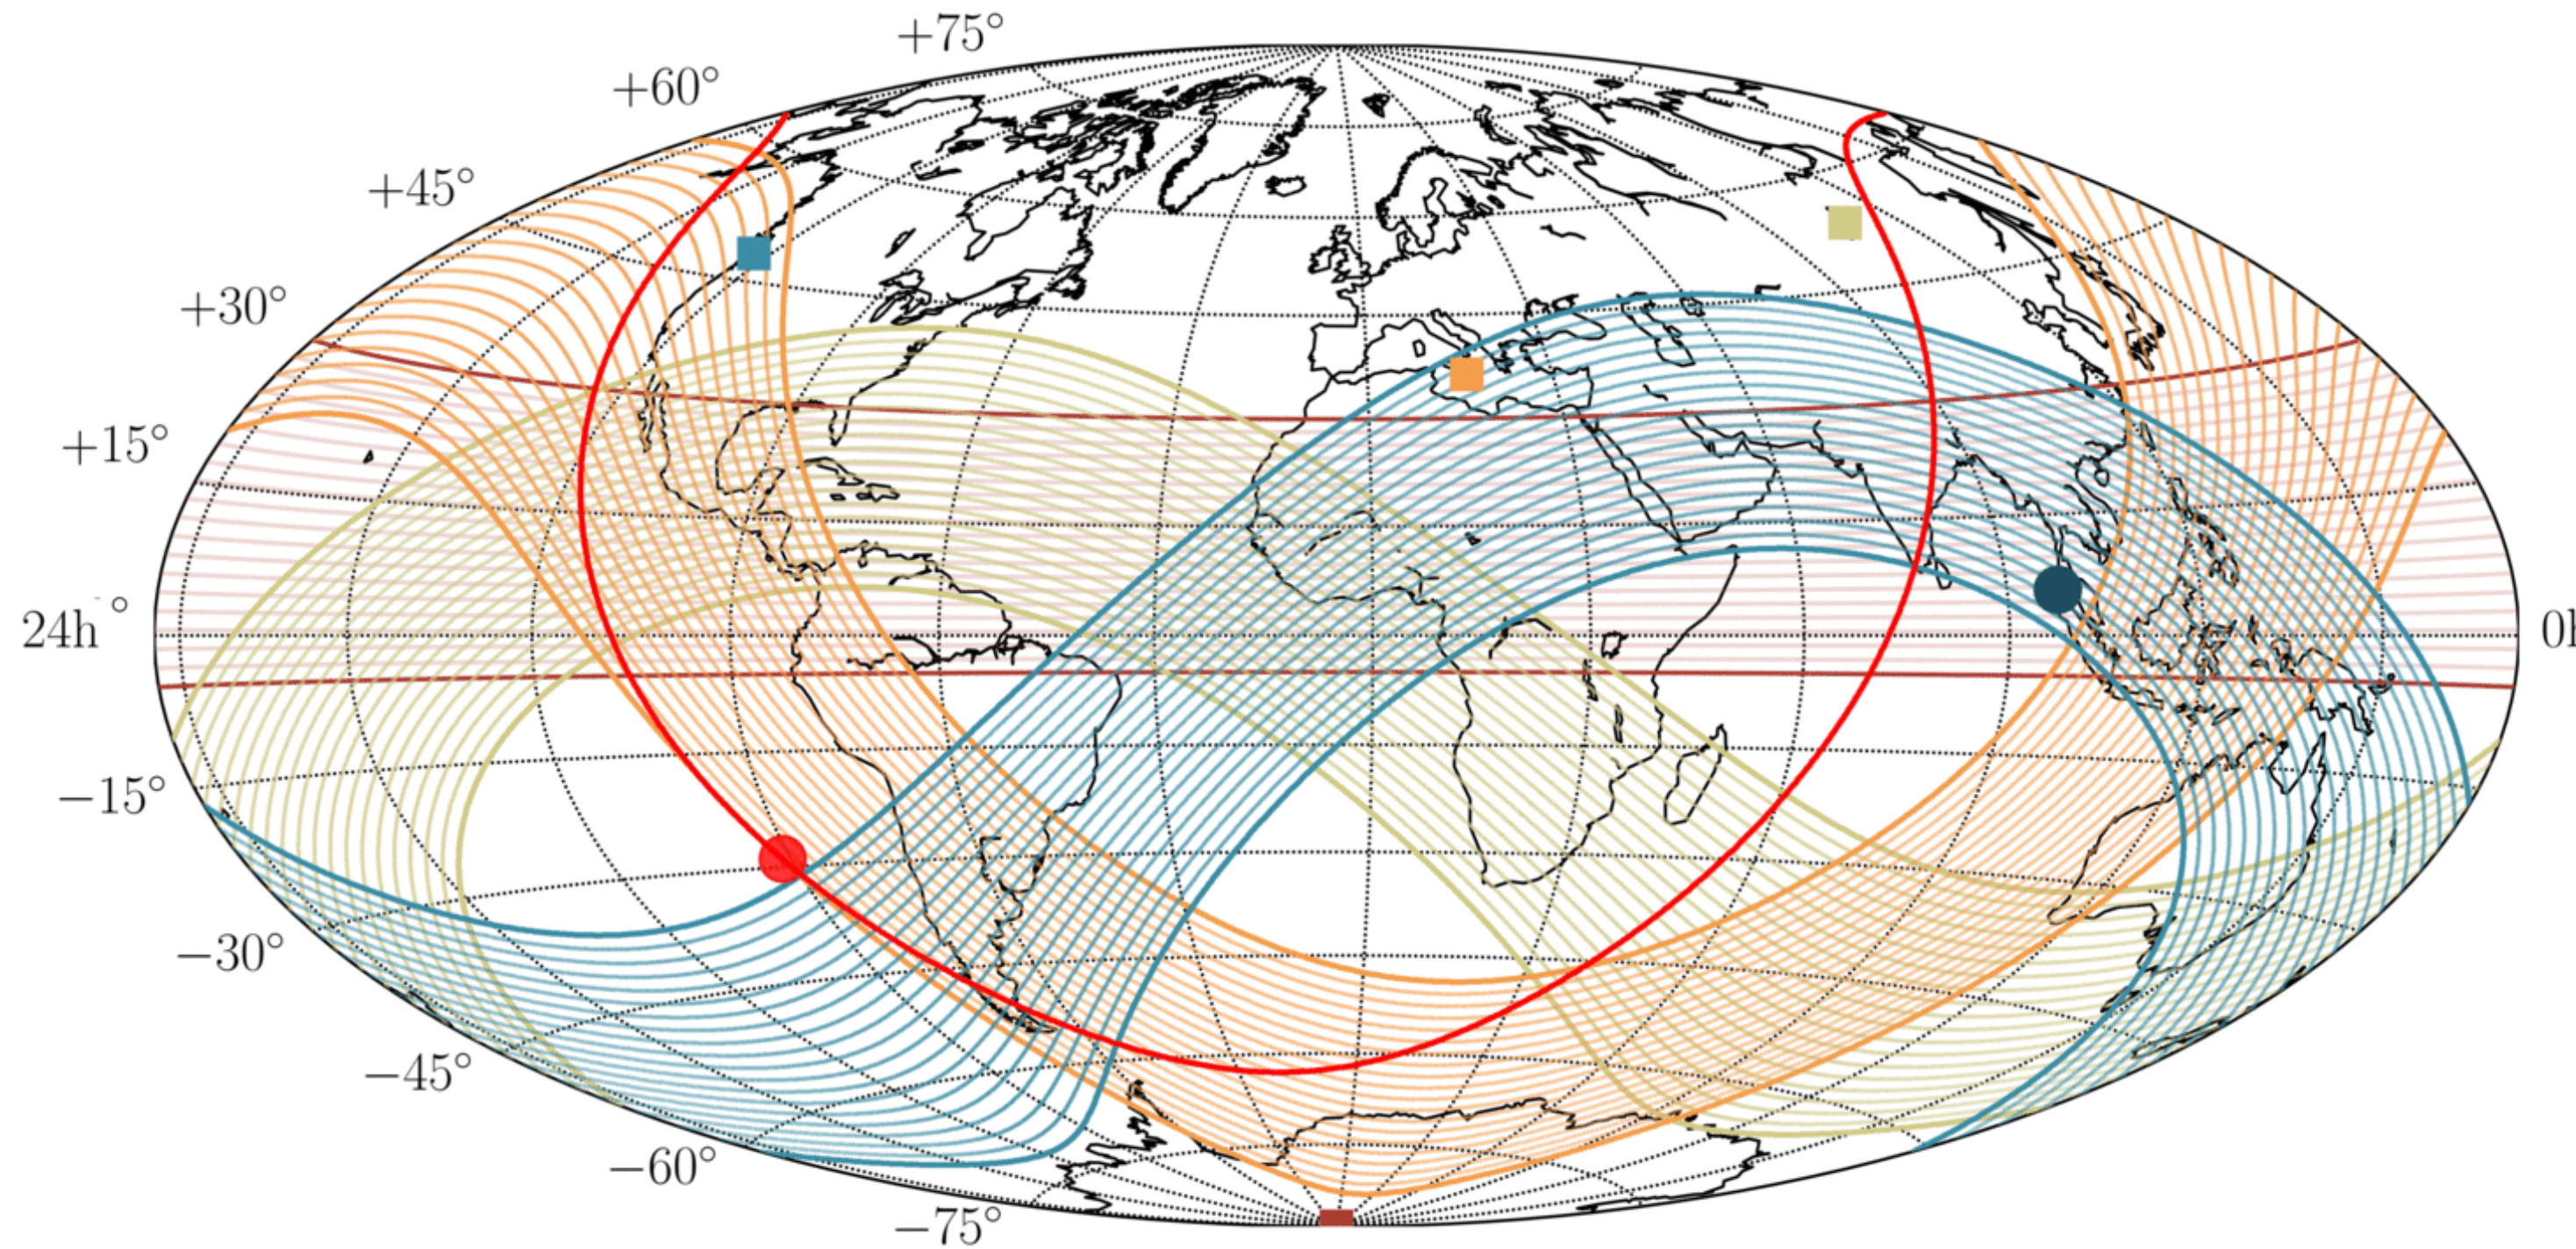

# NEUTRINO CHERENKOV TELESCOPES

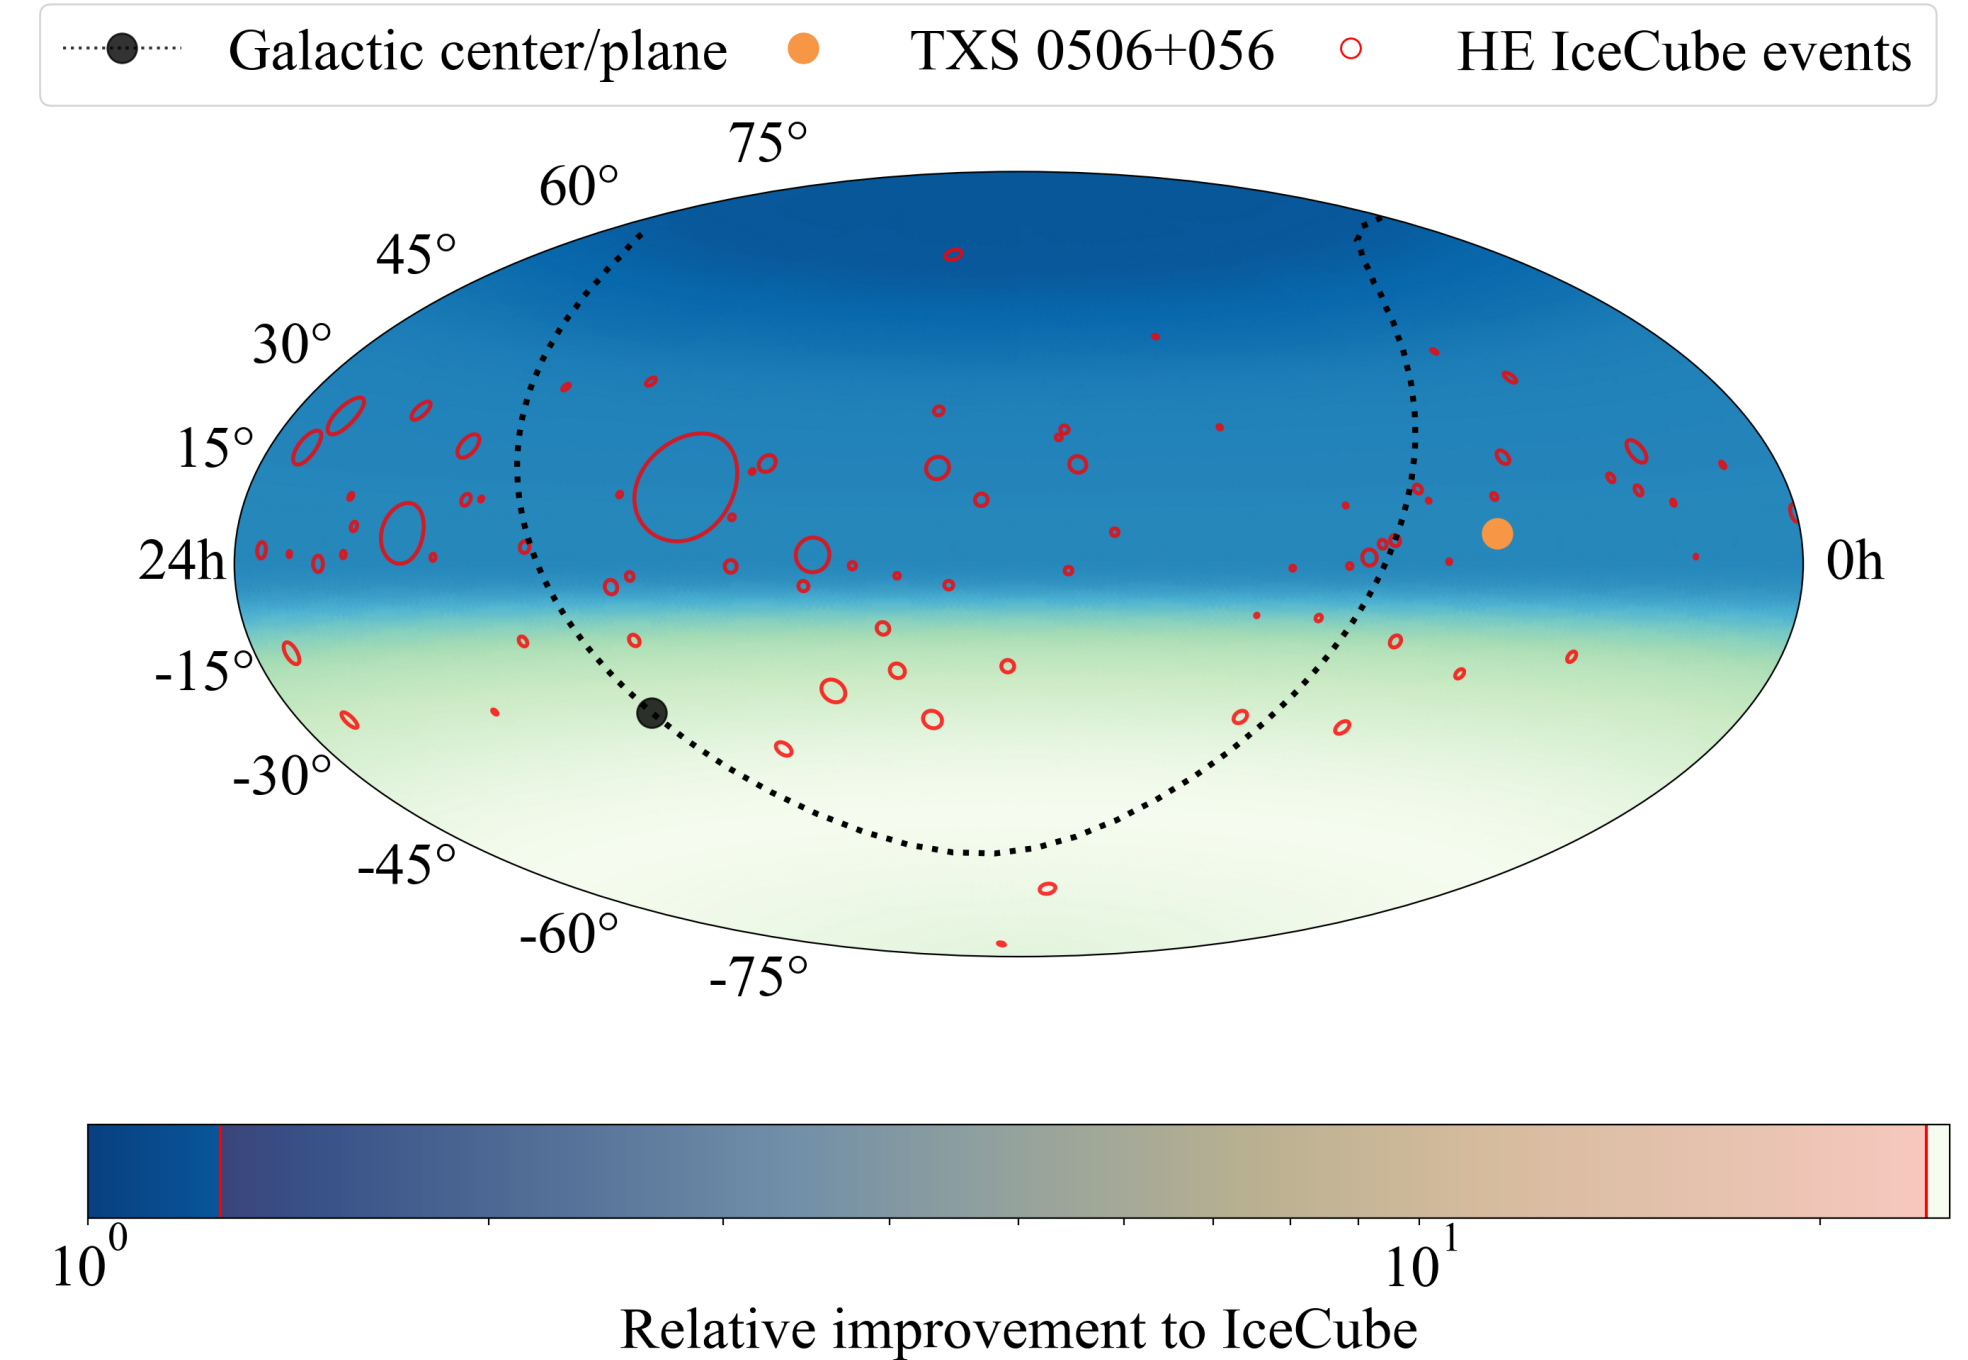

# COMBINING NEUTRINO OBSERVATIONS

<https://github.com/PLEnuM-group/Plenum>

## PLENUM

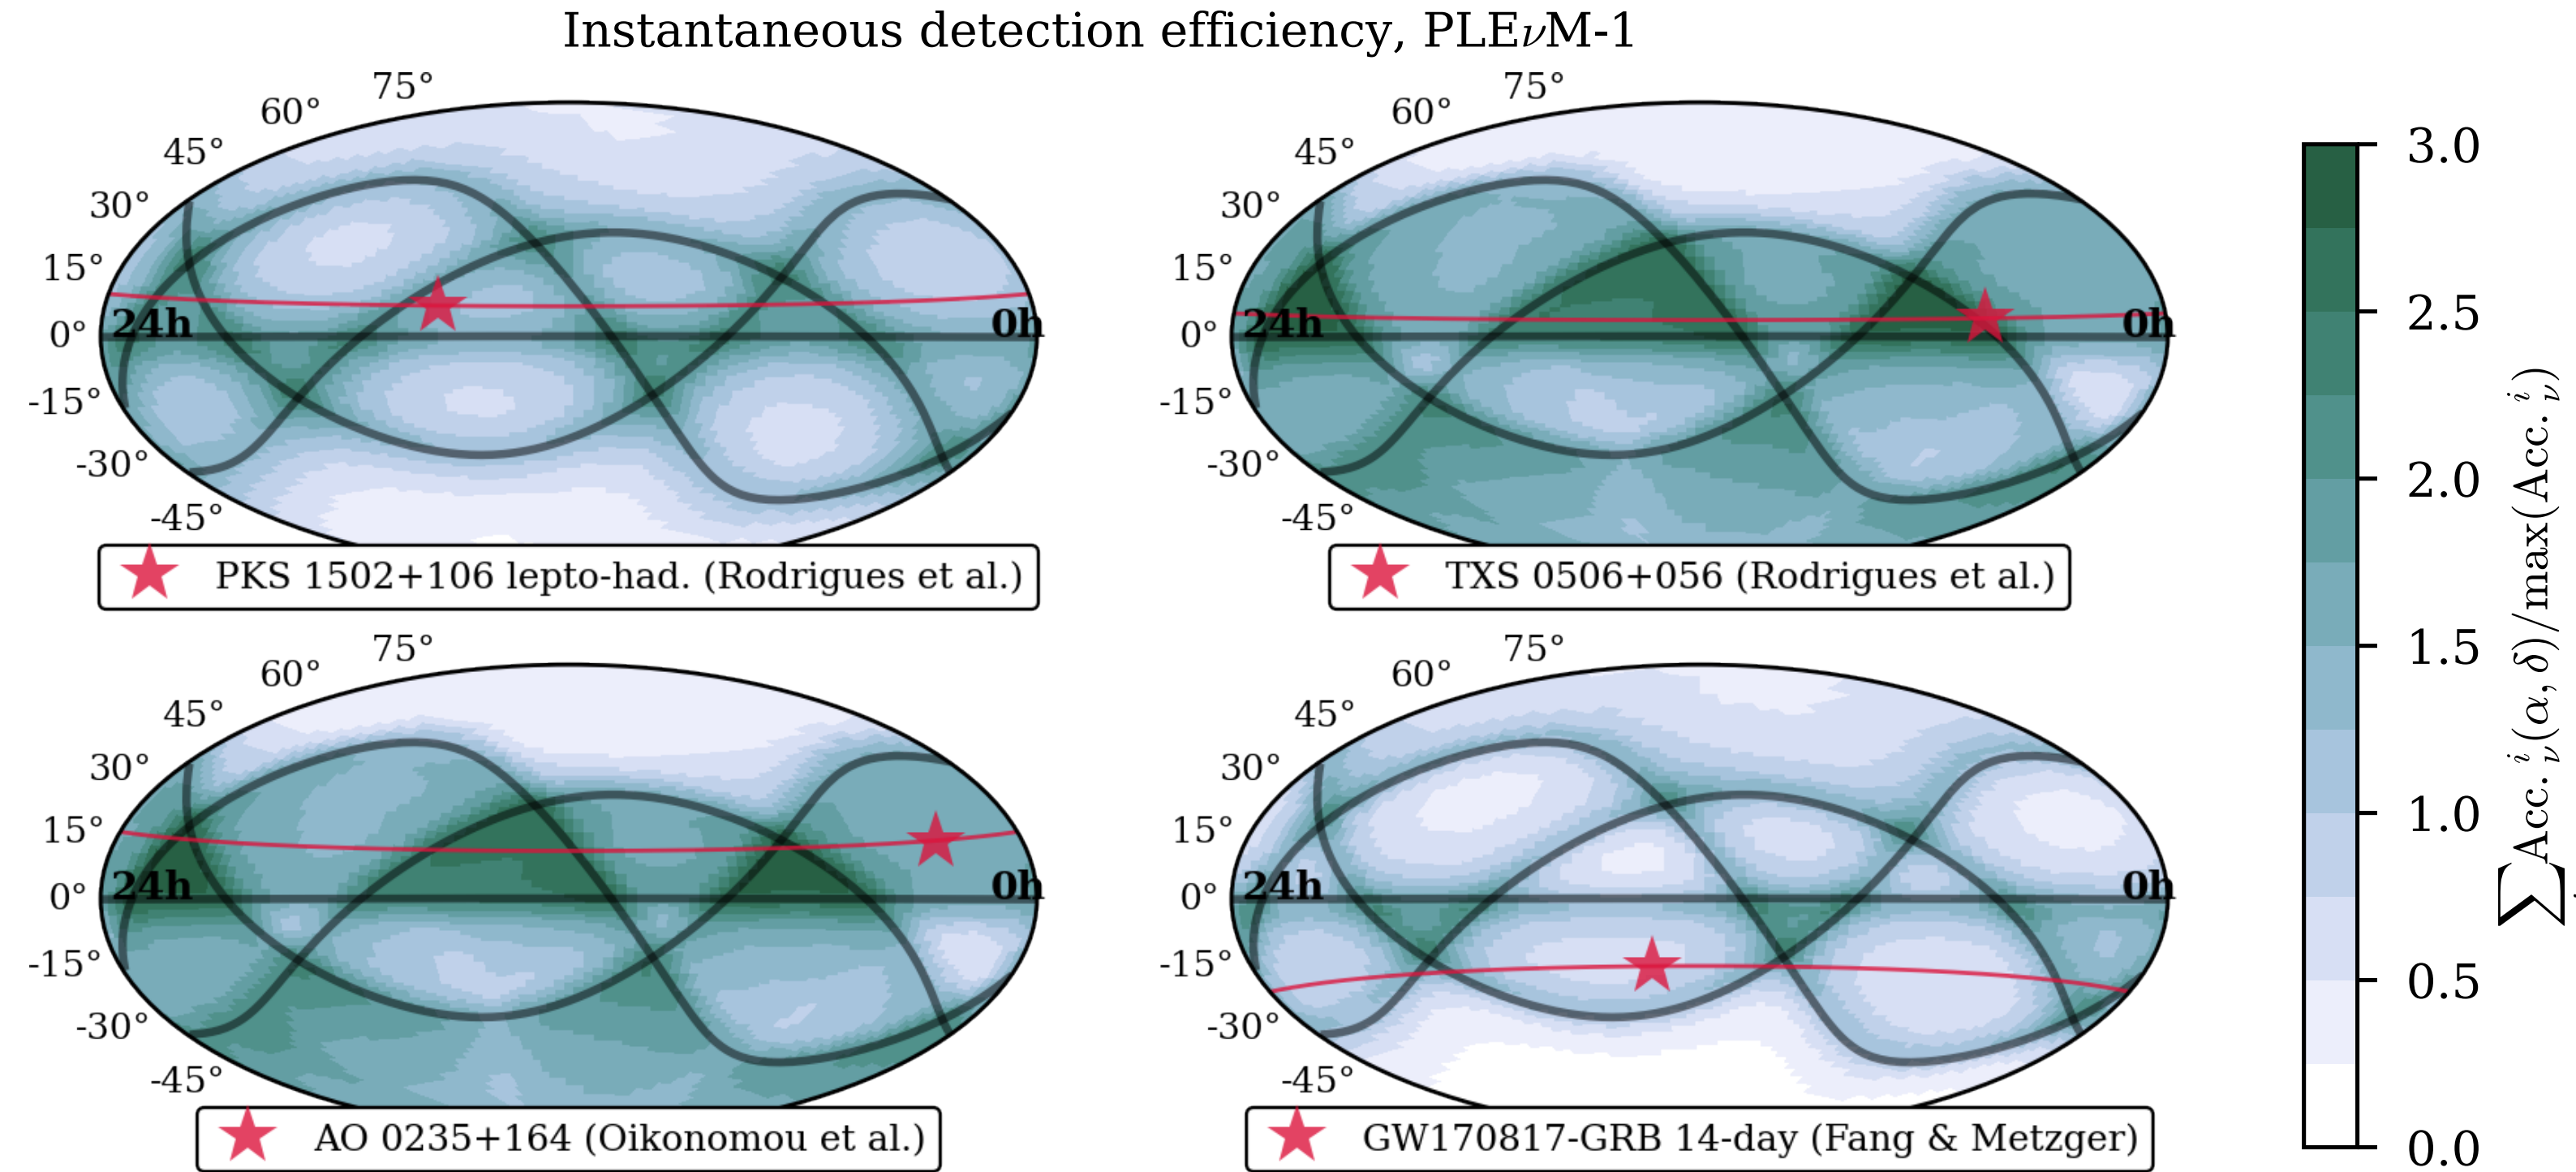

L. Schumacher et al. (arXiv/2107.13534)

- An improvement of  $\sim 25x$  in sensitivity could be accomplished by this network (wrt current IceCube).
- Prompt, well-reconstructed alerts from this network would enable sensitive **EM follow-ups**.

# COMBINING NEUTRINO OBSERVATIONS

L. Schumacher et al. ICRC 2023 (Vol 444 991)

- Significant improvements by combining detectors at different latitudes and longitudes (background suppression).
- Acceptance and sky coverage for alerts increased by a factor of  $\sim 5$ .
- Additional telescopes looking to expand statistics at the highest energies (e.g RNO-G, TRINITY, BEACON, GRAND, TAMBO).
- **There's significant gain in combining neutrino observations from multiple observatories (possibly in realtime)**

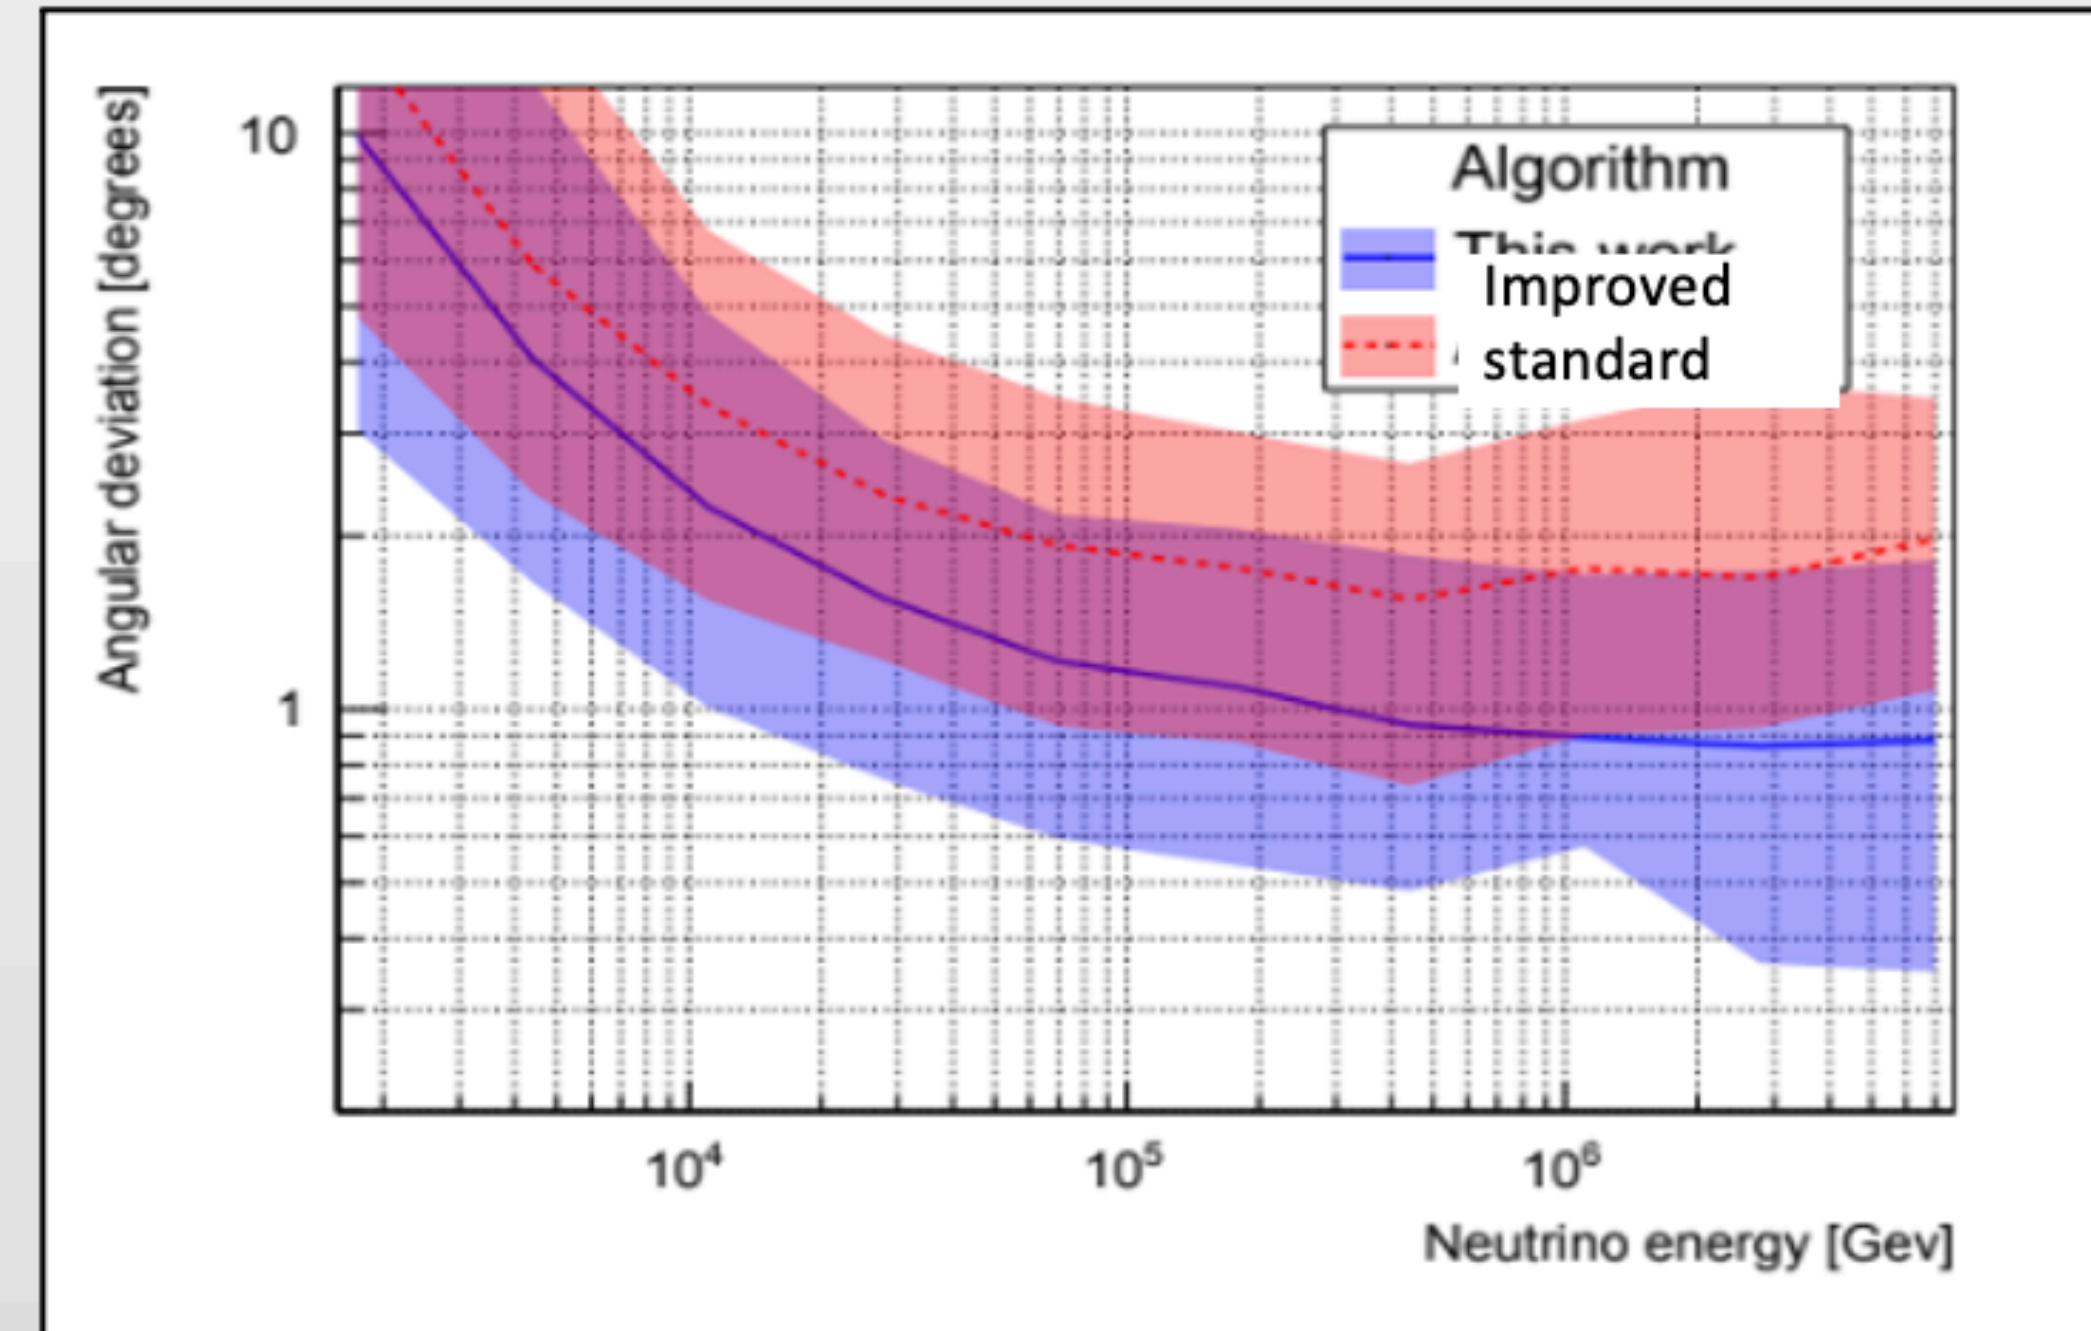

# ANGULAR RESOLUTION IMPROVEMENTS

## Tracks

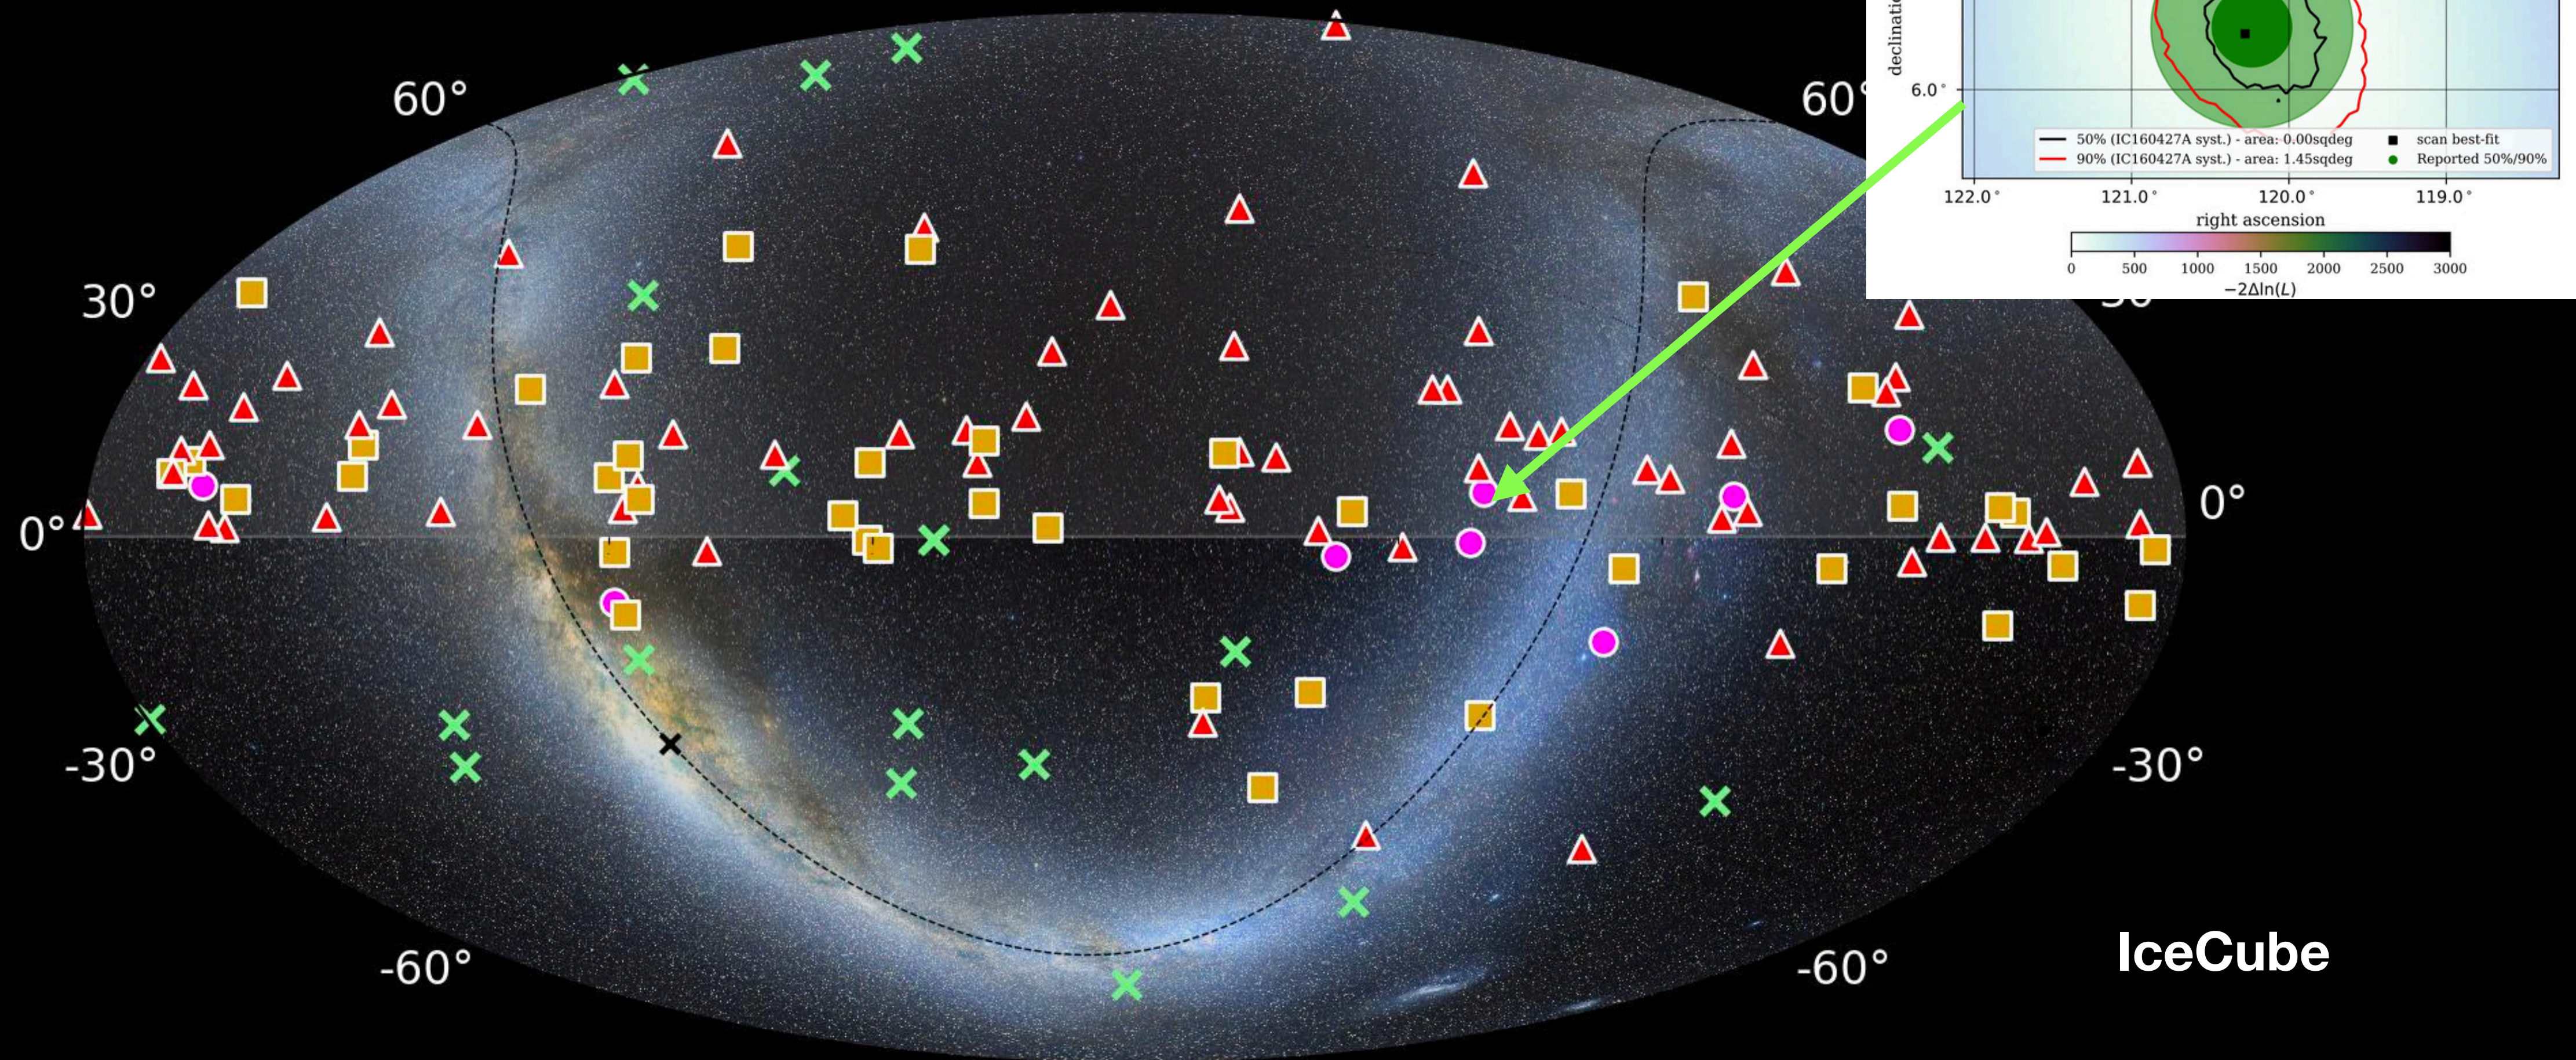

## Cascades

- Chance probability of correlation goes with PSF<sup>2</sup>
- **Current generation instruments are expected to reach O(0.1°) angular resolution for tracks, 2° for cascades.**
- Enable sensitive searches of neutrino counterparts with EM instruments.

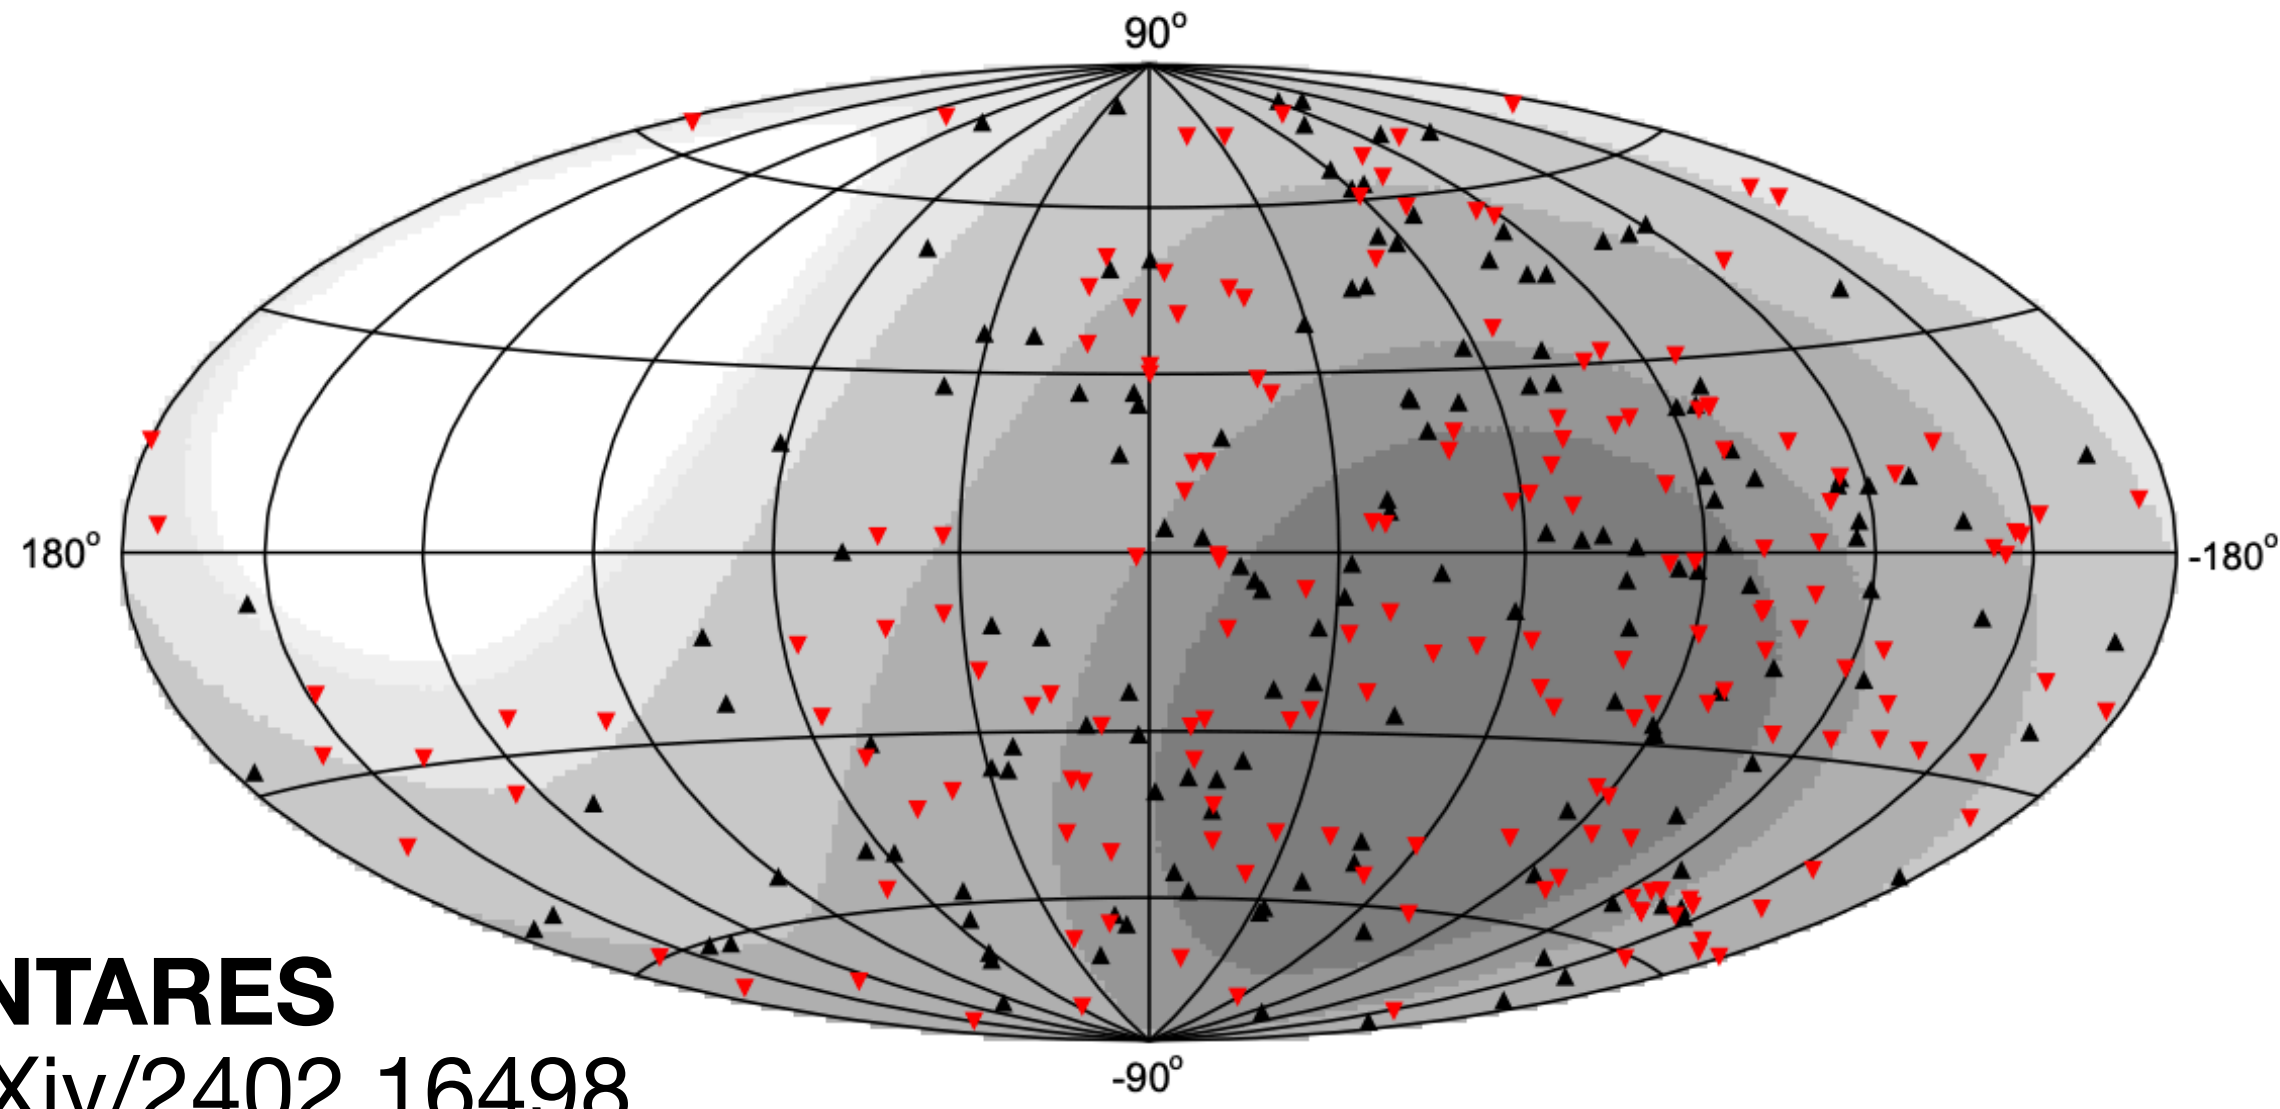

# REALTIME ALERTS

- Characterizing potential counterparts requires broadband EM observations.
- Understanding the PSF of neutrino telescopes is challenging! Limited by systematic uncertainties.

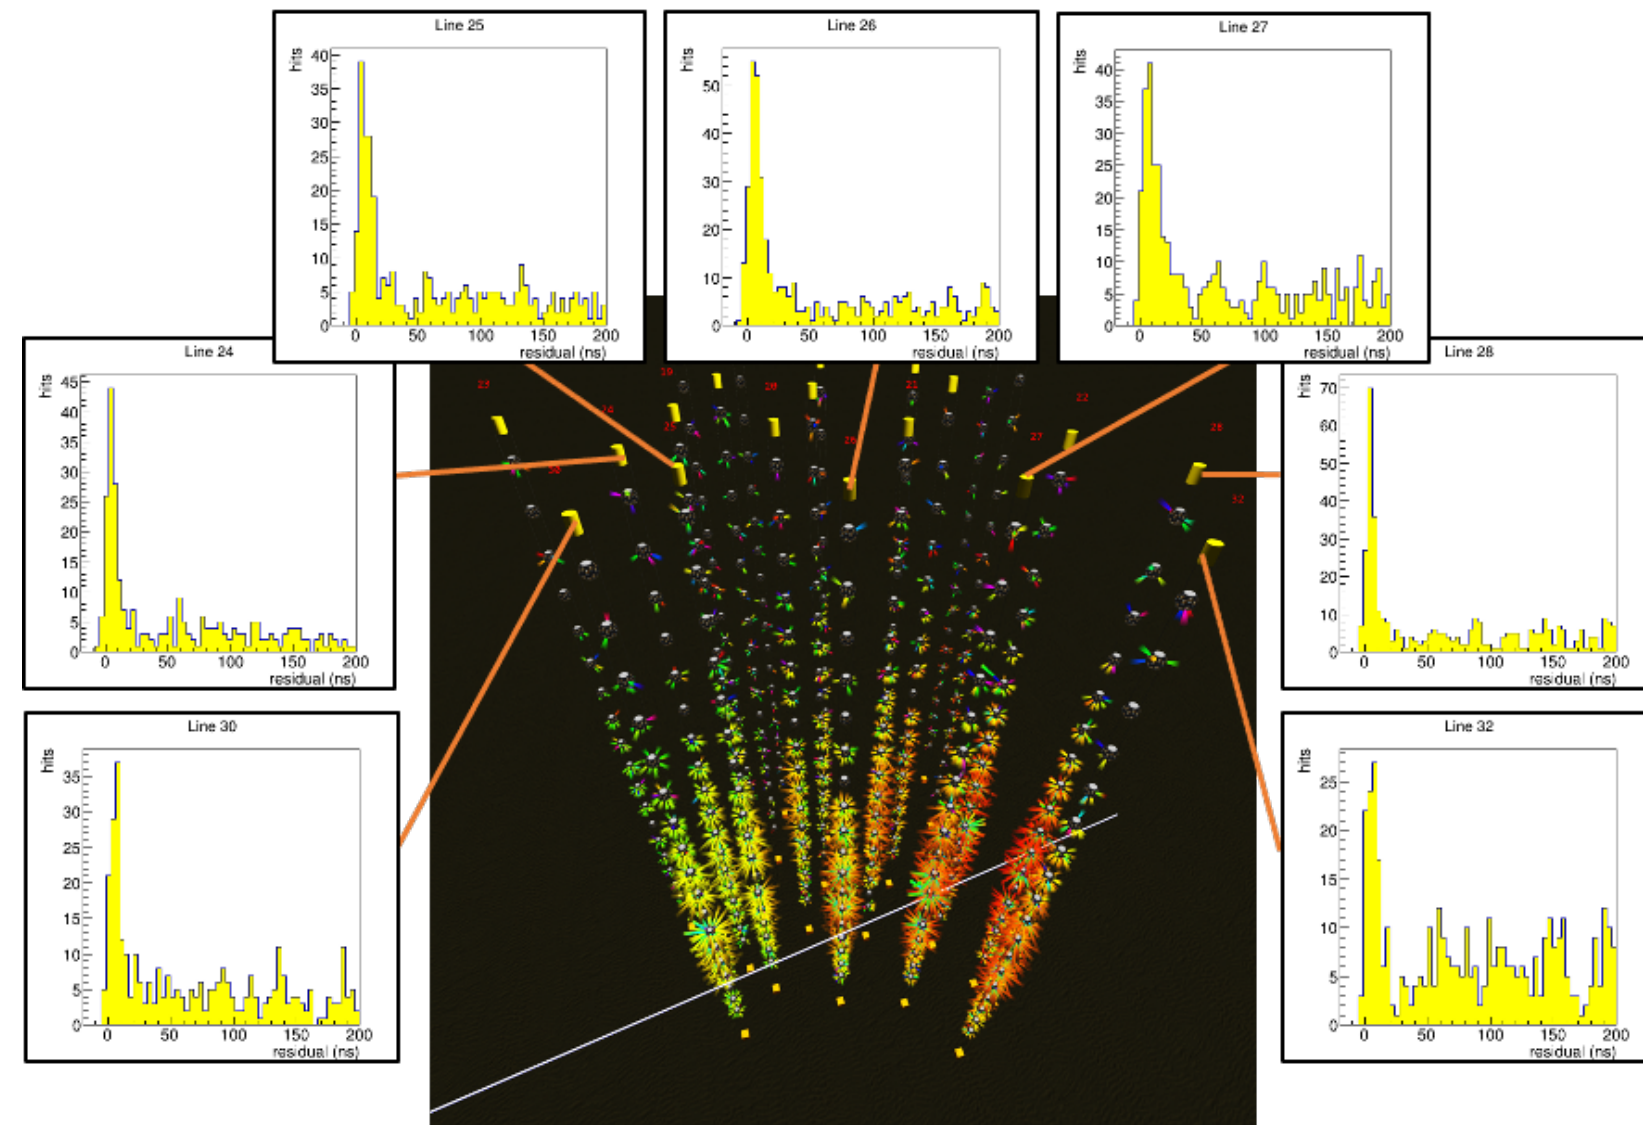

# REALTIME ALERTS

**ANTARES**  
arXiv/2402.16498

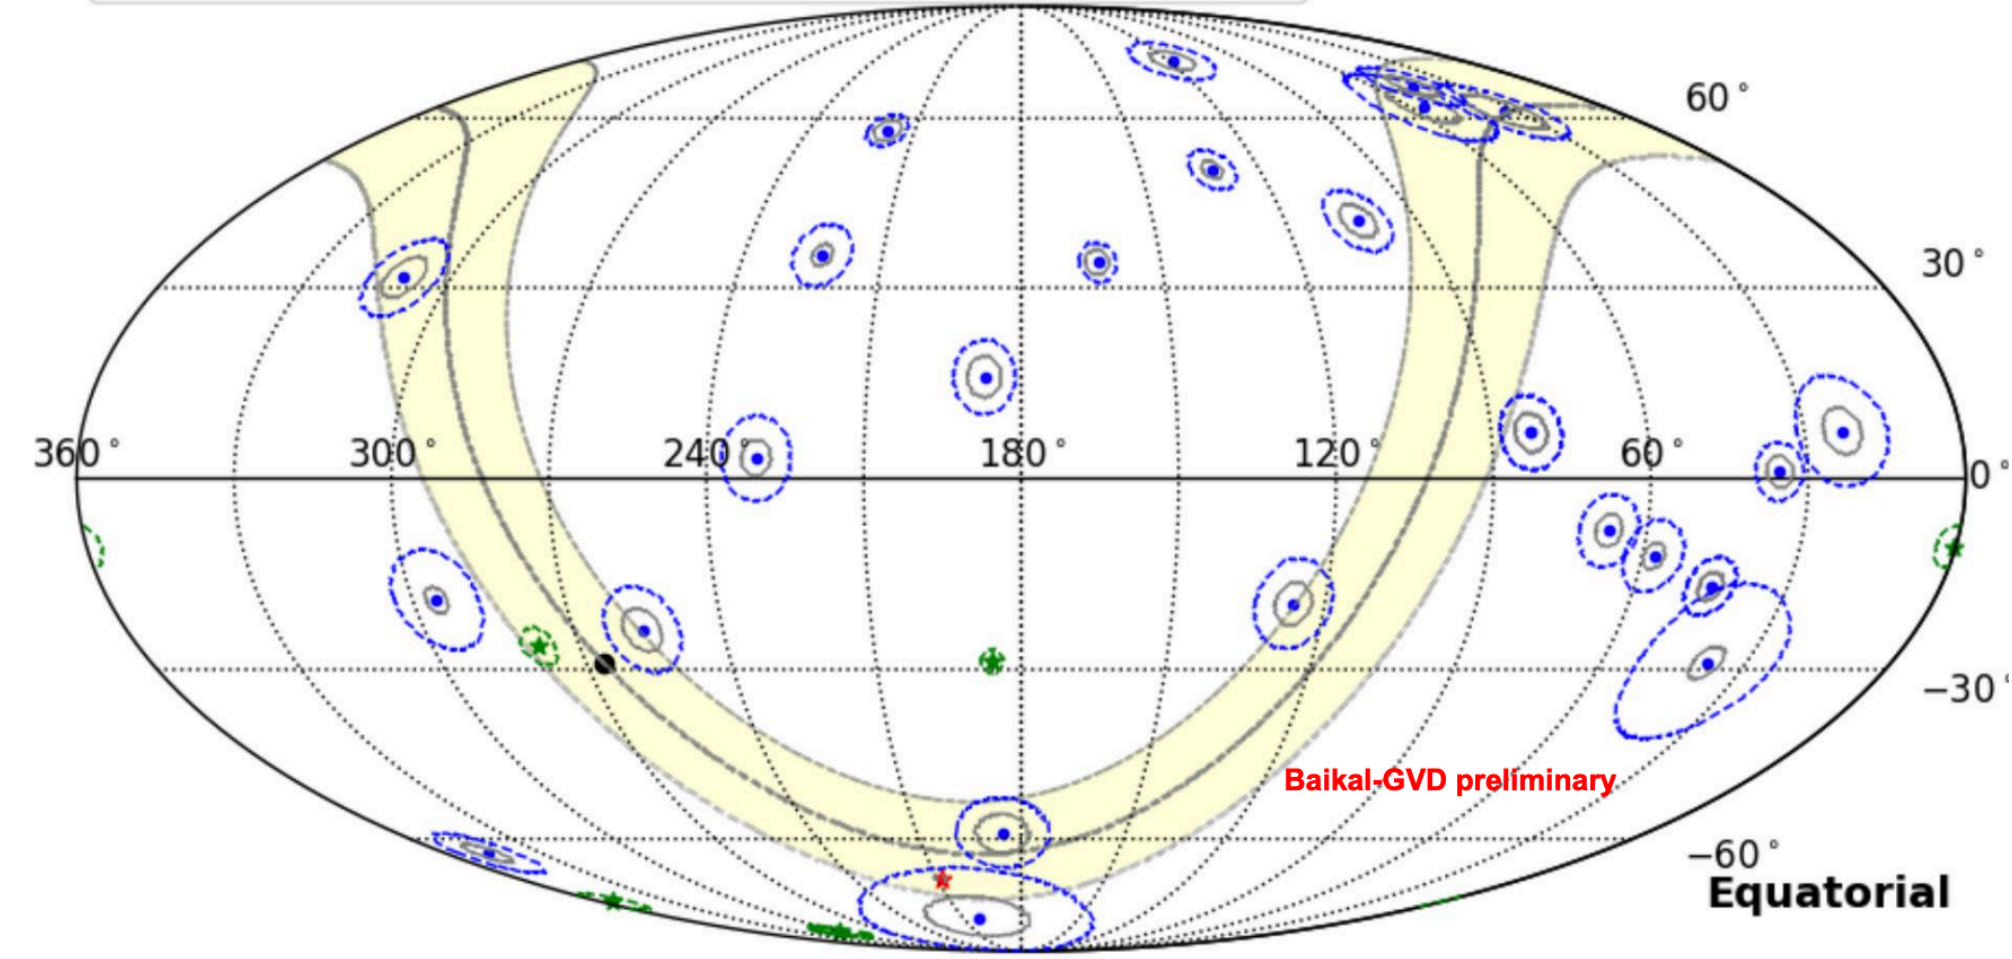

**KM3NeT**

- **Global neutrino observatory network becoming a reality.**

• Baikal-GVD HE cascade     • Galactic Center  
★ Baikal-GVD track-100TeV     ★ Baikal-GVD multi-cl track

## GVD - Tracks

## GVD - Cascades

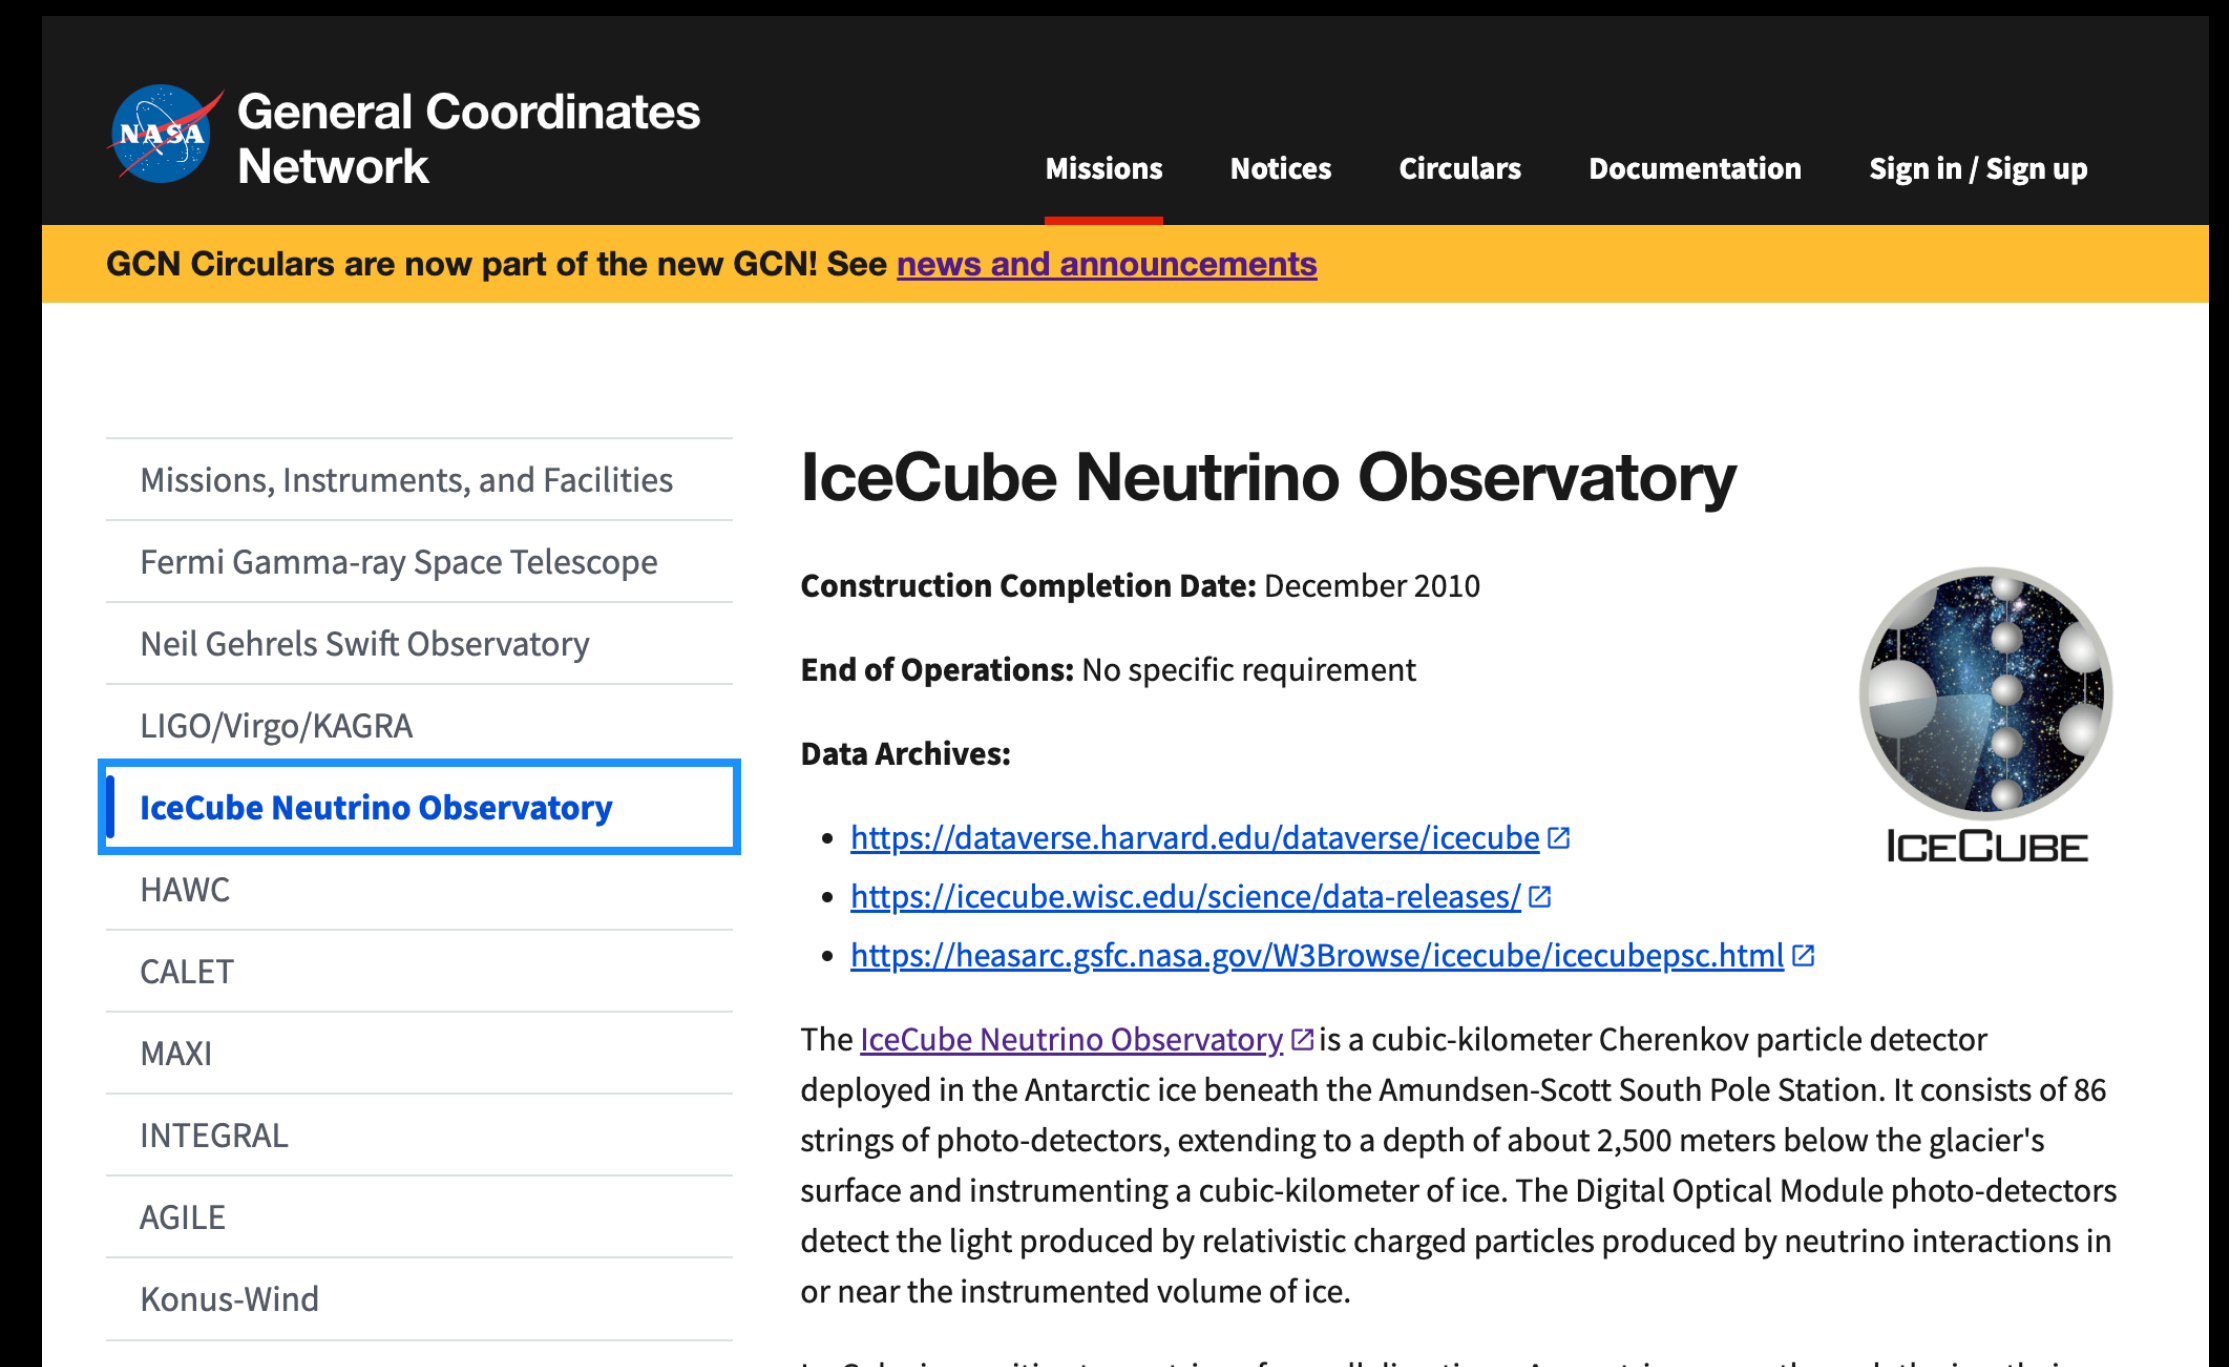

# FULLY INTEGRATING NEUTRINO TELESCOPES INTO TDAMM

- Working together to agree on data formats for neutrino results (both within the neutrino groups and with the broader astrophysics community).
- Current infrastructure relies largely on the NASA general coordinates network (GCN). IceCube collaboration with SciMMA.

- Most searches for transient/variable sources should be done in realtime if possible. Neutrino telescopes already working in that direction.
- EM searches for counterparts should also go in this direction

The screenshot shows the NASA General Coordinates Network (GCN) website. The header includes the NASA logo and the text "General Coordinates Network". Navigation links for "Missions", "Notices", "Circulars", "Documentation", and "Sign in / Sign up" are visible. A yellow banner below the header states "GCN Circulars are now part of the new GCN! See [news and announcements](#)".

On the left side, there is a list of missions, instruments, and facilities, with "IceCube Neutrino Observatory" highlighted in a blue box. Other items in the list include Fermi Gamma-ray Space Telescope, Neil Gehrels Swift Observatory, LIGO/Virgo/KAGRA, HAWC, CALET, MAXI, INTEGRAL, AGILE, and Konus-Wind.

The main content area is titled "IceCube Neutrino Observatory". It includes the following information:

- Construction Completion Date:** December 2010
- End of Operations:** No specific requirement
- Data Archives:**
  - <https://dataverse.harvard.edu/dataverse/icecube>
  - <https://icecube.wisc.edu/science/data-releases/>
  - <https://heasarc.gsfc.nasa.gov/W3Browse/icecube/icecubepsc.html>

Below this information is a paragraph describing the IceCube Neutrino Observatory as a cubic-kilometer Cherenkov particle detector deployed in the Antarctic ice. To the right of the text is a circular image of the IceCube detector array with the "ICECUBE" logo below it.

<https://gcn.nasa.gov/missions/icecube>

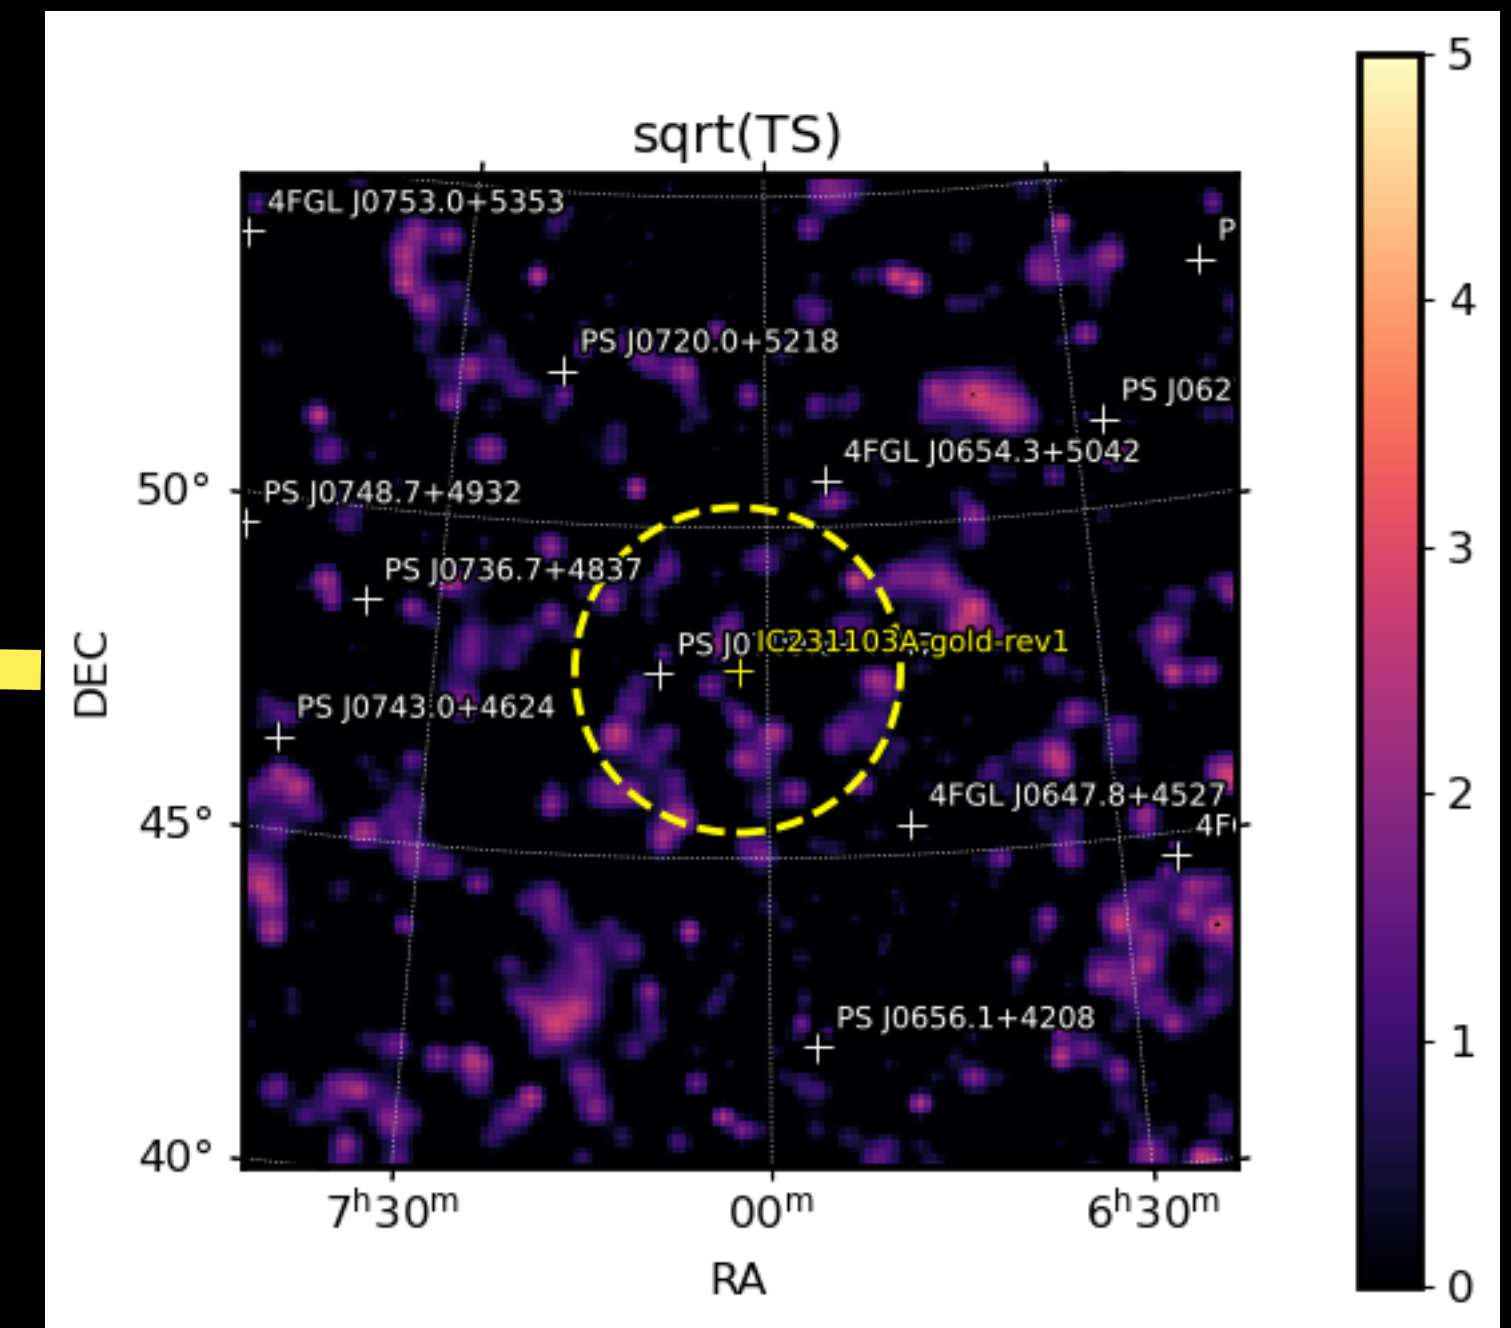

# TOOLS FOR DISSEMINATING REALTIME DETECTIONS EXIST!

The screenshot displays the Astro-COLIBRI web interface. At the top, the logo and name 'Astro-COLIBRI' are visible, along with navigation icons for share, download, chat, and personalization. A status bar indicates 'email sent to jmsantan' and 'Infos: v2.19.0'. Below this, there are filters for 'Observatories' (Swift, SVOM, Fermi, HAWC, IceCube, AMON, Integral, GECAM, FlaapLUC, LVC, Catalogs, Other) and 'Event type' (FRB, Unclassified OT, Classified OT, SN, GRB, burst, neutrino, nuem, GW, 4FGL, TeVCat, X-ray, IceCat). A timeline shows dates from 2024-11-27 to 2024-12-12. The main content area features a list of recent detections on the left, a central star chart with a 'Cone search' tool, and a detailed information panel on the right for the selected event 'IceCube-241127A Neutrino'. The detailed panel includes the name, detection time (2024-11-27 14:11:14), localisation (RA: 164.09, Dec: 5.38), and a descriptive paragraph about the event's significance. A yellow banner at the bottom right of the interface contains the URL <https://astro-colibri.com/> and mentions 'iPhone/Android app'.

# AN EXAMPLE WITH FERMI-LAT

- <https://multimessenger.ua.edu/fermi/> (Under development)

# INSTANTANEOUS SENSITIVITIES FOR GROUND-BASED INSTRUMENTS

- Instantaneous effective area for a combined IceCube (current generation) + Baikal-GVD + KM3NeT using IceCube-86  $\nu_\mu$  effective areas for orientation at 100 TeV (where the astrophysical flux starts to dominate).
- Some locations are favored for fast transients.

# REALTIME NEUTRINO ALERTS

Sep 29, 2017

## Fermi-LAT

0.1 - 300 GeV

- |  |                                   |  |        |  |               |
|--|-----------------------------------|--|--------|--|---------------|
|  | Extremely-high energy (EHE)       |  | Bronze |  | Neutrino + EM |
|  | High-energy starting event (HESE) |  | Gold   |  | Cascades      |

- IceCube-170922A: 290 TeV neutrino energy
- Correlated with flaring, hard-spectrum gamma-ray blazar **TXS 0506+056** ( $3\sigma$ ). Additional neutrino emission in 2014-2015.
- **Efforts to start realtime programs in KM3NeT, Baikal-GVD are underway.**

# PHOTONS FROM TXS 0506+056

MAGIC  
(ApJL 2018)

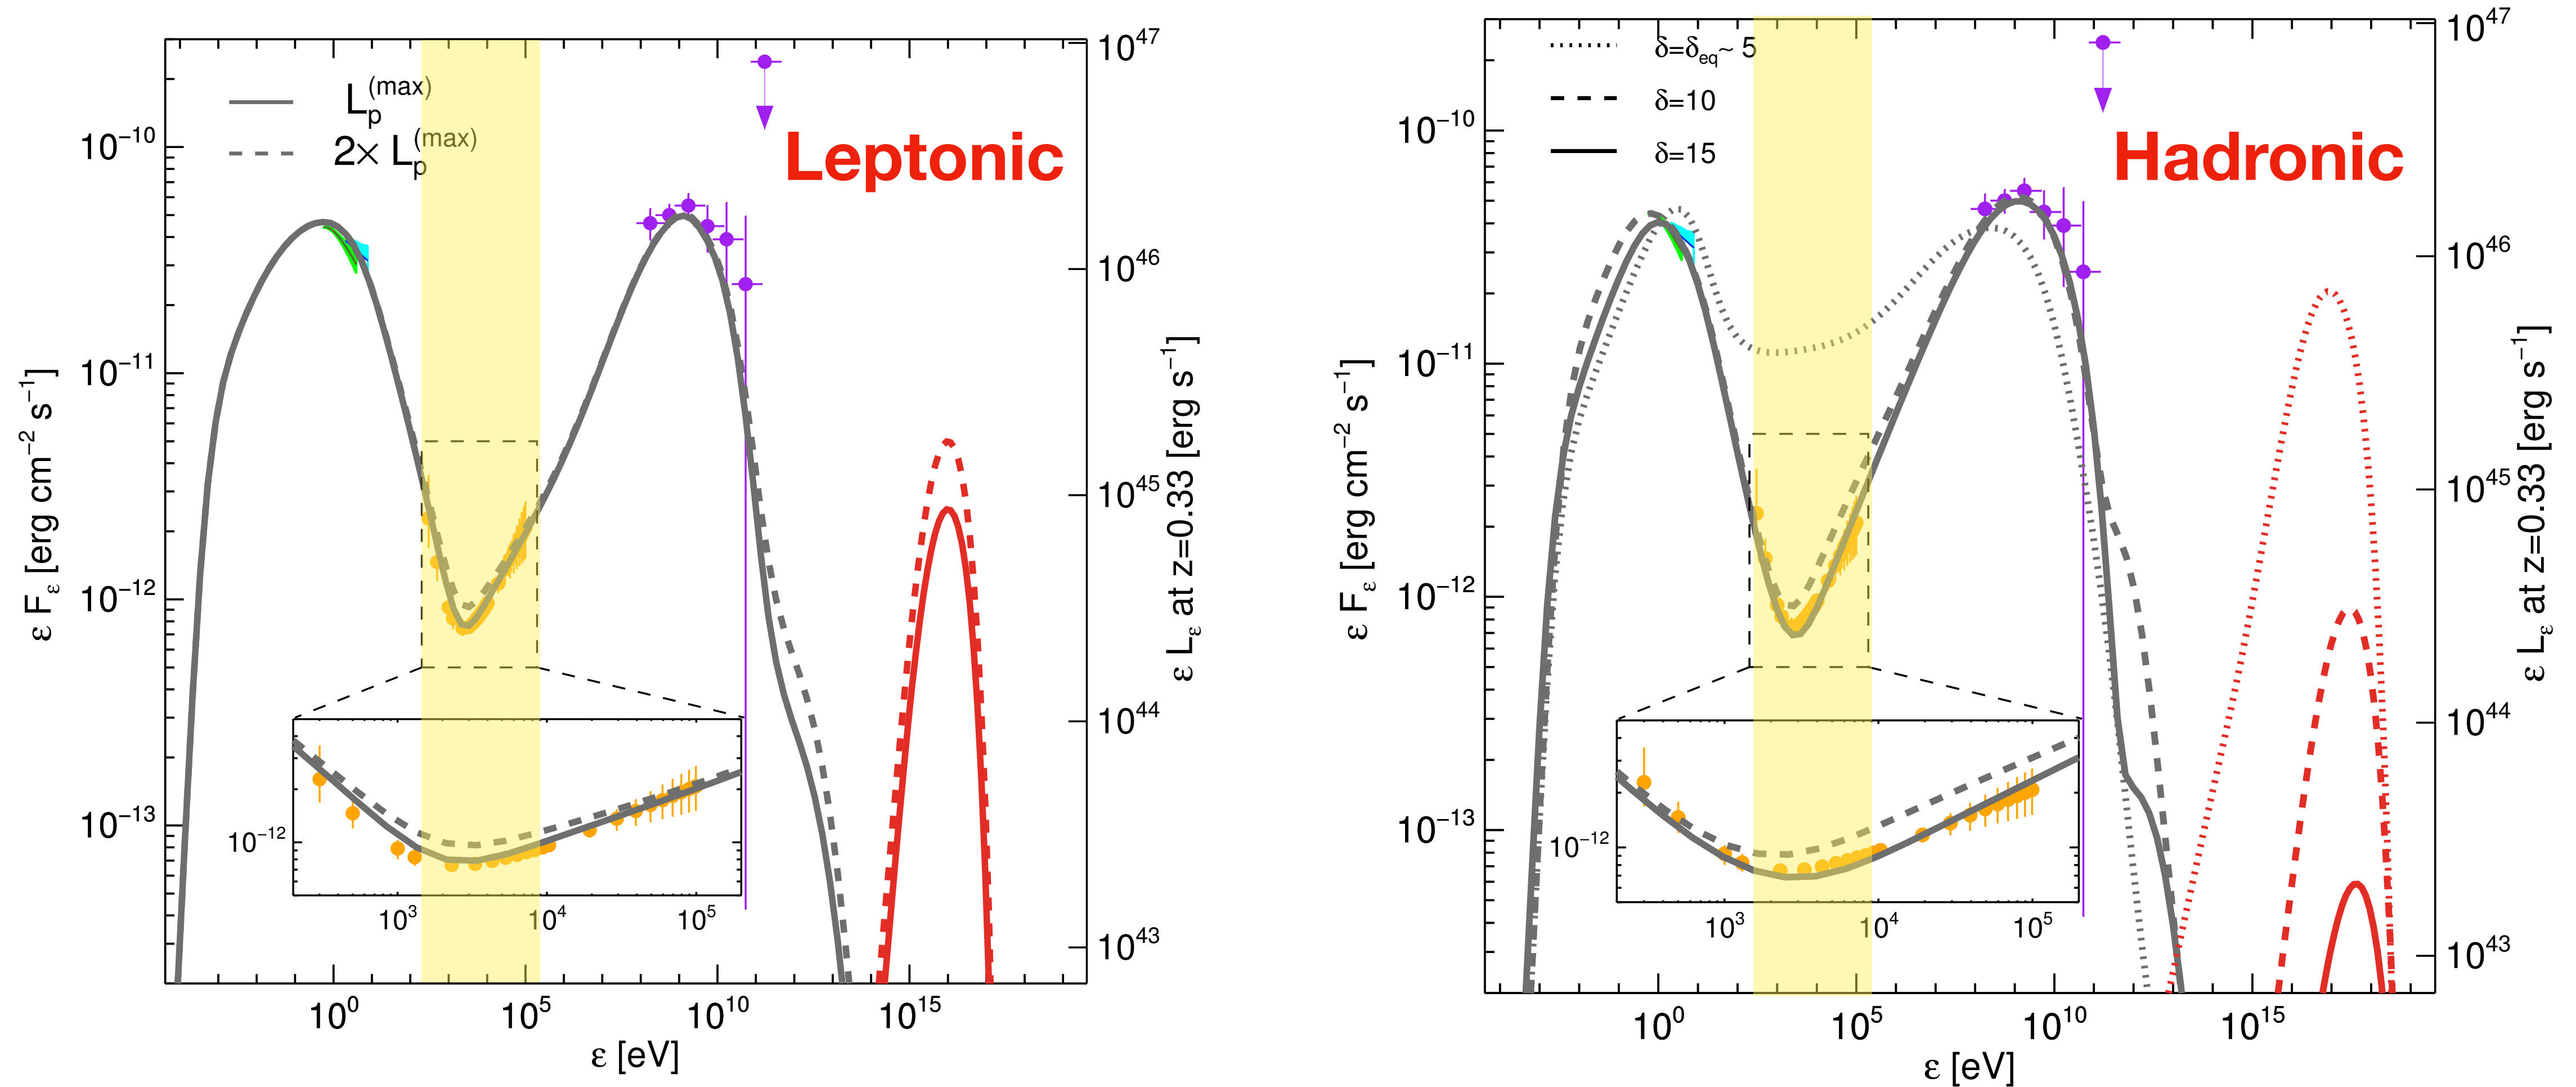

VERITAS  
(ApJL 2018)

- TXS 0506+056: *Fermi* blazar at  $z=0.34$ . Broad multi-wavelength follow-up campaign, led to the detection of the source  $>100$  GeV by ground-based gamma-ray instruments.
- **$3\sigma$  chance coincidence correlation. Evidence for a connection between TXS 0506+056 and IC170922A.**

# MODELING THE 2017 NEUTRINO EMISSION

Keivani et al. (arXiv/1807.04537)  
among many others

- **Strong constraints on hadronic emission from X-ray observations.**

# TIME-DEPENDENT EMISSION FROM TXS 0506+056

Petropoulou, Murase, MS, ++ (2019)

- IceCube archival analysis revealed a  **$13 \pm 5$  neutrino excess ( $3.5\sigma$ )** in 2014-2015 over 110 days.
- No evidence for EM flaring activity from the source in 2014-2015.
- **Most models over-predict the X-ray to gamma fluxes.**
- Multi-messenger follow ups will be crucial in the coming decade.

Many modeling efforts for 2014-15/17:  
 Reimer+ 2019, Cerruti+ 2018, Zhang+ 2018, Keivani 2018+, Petropoulou+ 2019

# X-RAY COVERAGE

## Neil Gehrels *Swift* Observatory

**XRT sensitivity in the 0.3-10 keV**  
Fast response, low overhead.  
110 cm<sup>2</sup>  
~0.4 deg FoV. Launched in 2004.

## STAR-X (NASA)

**Not selected for further study  
By NASA**  
x7 FoV of Swift XRT  
x16 effective area

## SVOM (China-France)

Rapid follow-ups of GRBs  
**Launch date on Jun 22, 2024**  
0.2-10 keV  
“Lobster eye” optics with 1  
deg FoV

## Einstein Probe (China-ESA)

Launched January 2024

lobster-eye MPO + CMOS  
FoV: 3600 sq deg (1.1 sr)  
band: 0.5 – 5 keV soft X-ray  
eff. area: ~3 cm<sup>2</sup> @1keV  
FWHM: ~ 5', positioning <1'  
Wolter-1 type + CCD  
FoV: 38'  
band: 0.3-10keV  
eff. area: 2x 300cm<sup>2</sup> @1keV  
angular FWHM: 30"

## THESEUS (ESA)

Soft X-ray Imager (SXI): 0.3 - 5 keV  
Total FoV of ~0.5 sr with a localization accuracy  
of <2'

XGIS: 2 keV - 10 MeV with FoV >2 sr with < 15'  
GRB localization

Not selected as of 2023. Resubmission planned.

# NEUTRINO-EM SOURCE ASSOCIATIONS IN THE NEXT DECADE

- Pointed follow-ups require a good reference catalog to compare against (**e.g eROSITA**). We don't know (yet!) what exactly we're looking for!
- Sources are transient or highly variable, hampering strong predictions. An emerging pattern is necessary.
- **Calculation of association probabilities is a critical factor in correlation claims.**

Swift tiling of neutrino position

## Swift follow-up of neutrino events

Evans et al.

<https://arxiv.org/abs/1501.04435>

# MEV-GEV COVERAGE

**Fermi-LAT**

Sensitivity in the **0.1-300 GeV**  
 Large FoV (all-sky coverage in few days)  
 Launched in **2008**.

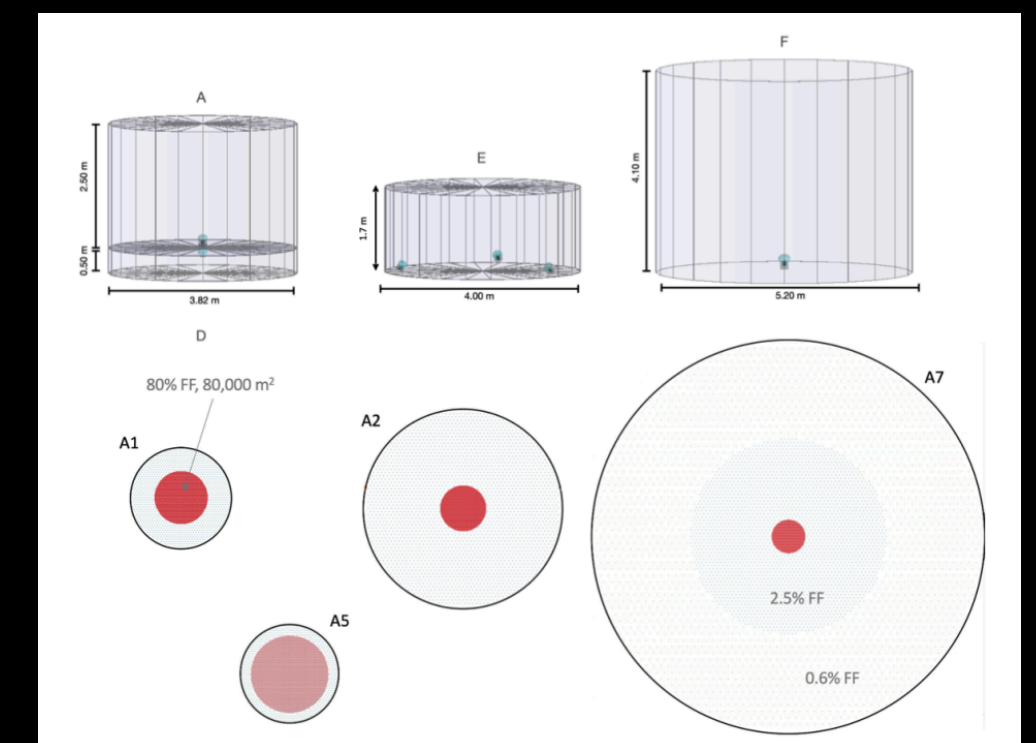

- AMEGO angular resolution: 3° (1 MeV), 10° (10 MeV)
- ComPair prototype for AMEGO.
- AMEGO-X Explorer proposed, no selected.
- e-ASTROGAM not selected at the moment.

# COVERAGE IN THE VERY-HIGH-ENERGY RANGE

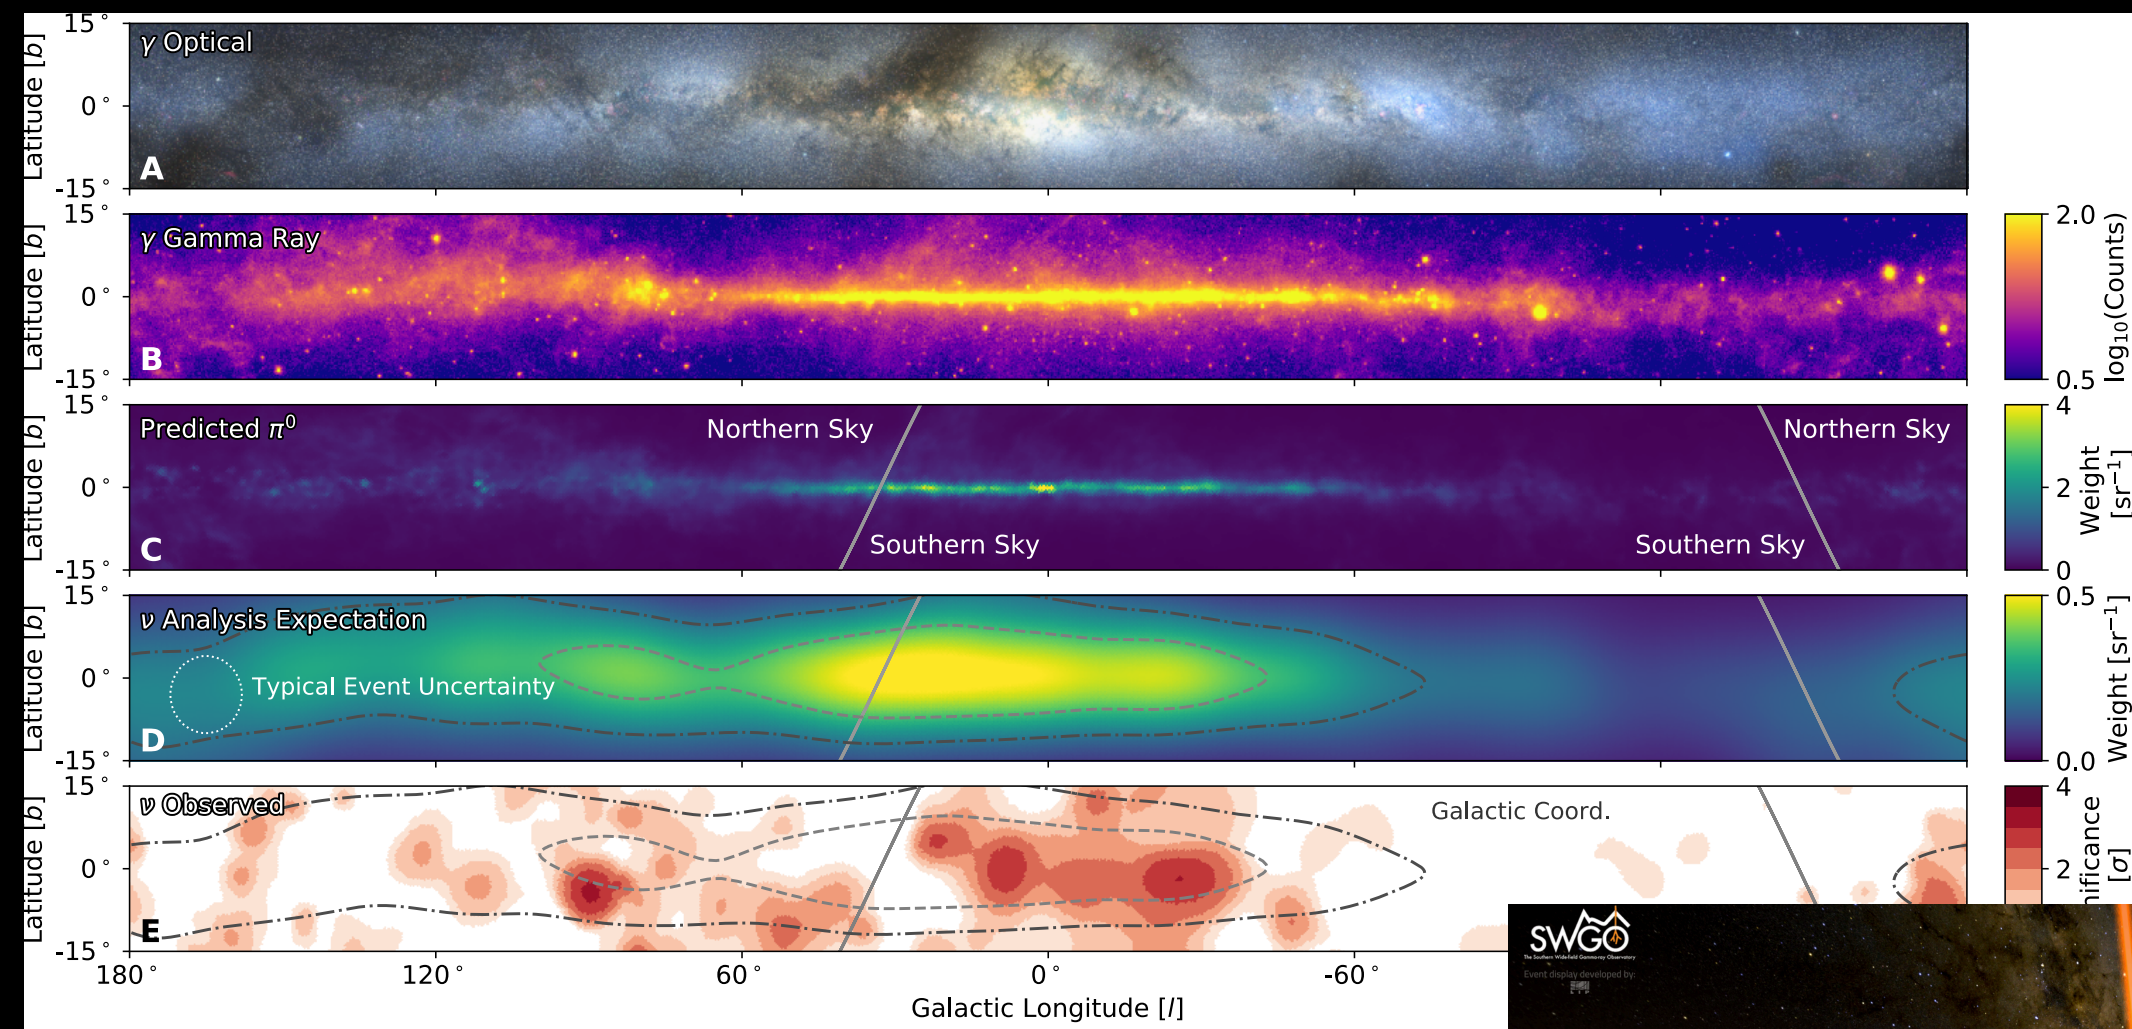

SWGGO

- CTA to provide a x10 improvement in sensitivity in the VHE band (>50 GeV). Prototypes telescopes already detecting sources!
- Neutrino follow-ups and strong AGN science program for CTA.
- Air shower arrays (HAWC, LHAASO, proposed SWGGO) provide large FoV coverage for diffuse/extended sources.

# SYNERGISTIC OPPORTUNITIES FOR SWGO

IceCube  
[arXiv/2307.04427](https://arxiv.org/abs/2307.04427)

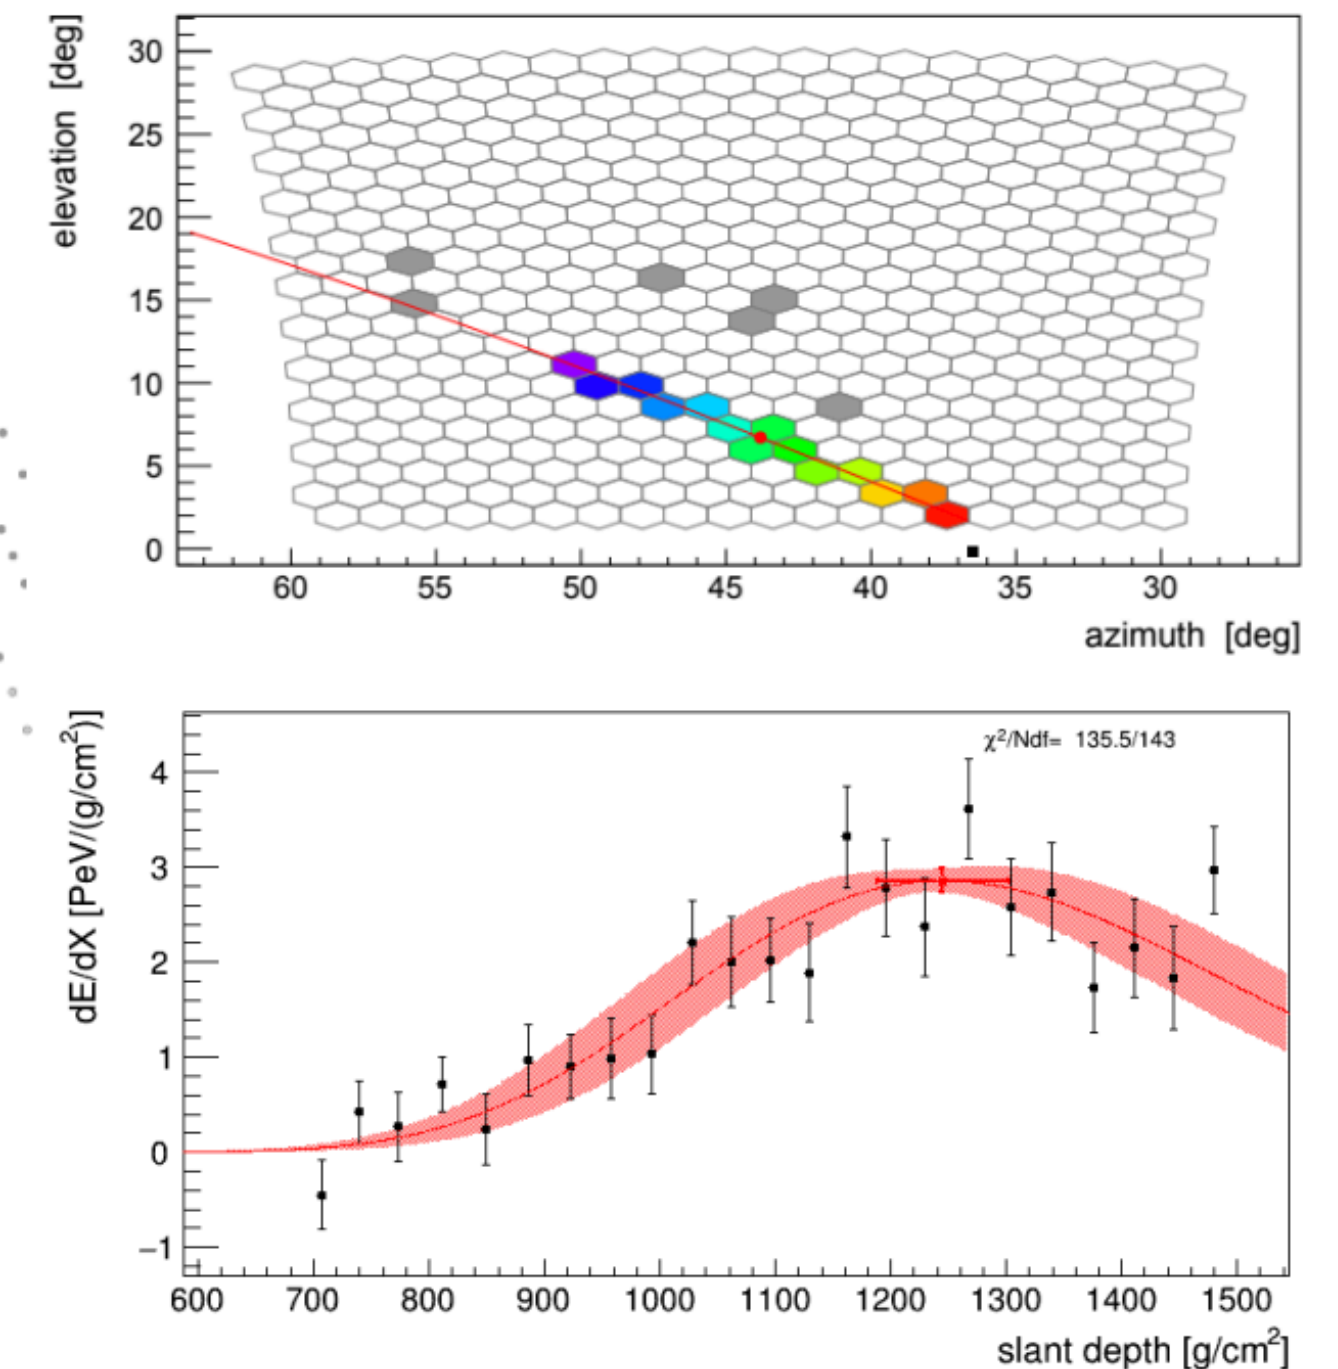

- CTAO + SWGO: Characterize VHE-UHE emission from the Galaxy in the southern hemisphere.
- Prompt VHE follow-ups of neutrino alerts.

# MORE SYNERGIES? UHE PHOTONS AND NEUTRONS

Most significant photon candidate event in Auger  
[arXiv/2406.07439](https://arxiv.org/abs/2406.07439) (Auger Collab.)

- Release photon candidates in realtime? (Even with low signalness!)
- Neutron multiplets? (Talk by D. De Oliveira Franco at this workshop)

# WISHLIST FOR MMA STUDIES WITH NEUTRINOS

- **On the threshold of real neutrino astronomy, but...**
- Increase the number of neutrino events  $>100$  TeV (high astrophysical purity)
- Improve the angular resolution (correlation probability goes with  $\text{PSF}^2$ )
- As neutrino telescopes are  $4\pi$  instruments, you need **wide-field, continuous, broad-band, sensitive coverage across the EM spectrum.**
- **New instruments** where sensitivity is currently lacking (soft X-rays to MeV range, improved sensitivity in the VHE range). Continue exploring other wavebands with new capabilities (Rubin, ngVLA, SKA, CMB-S4 are coming up!)
- **Continued operation** of instruments with no obvious substitute (e.g. Fermi)
- **Stronger integration** among neutrino telescopes and with the EM community.
- **Better source candidates!** Search for hadronic emission signatures (orphan flares? PeV emission?)

An aerial photograph of Paris, France, taken at dusk or dawn. The Eiffel Tower is visible on the left side of the image, silhouetted against the dark sky. The Seine River flows through the center of the city, with several bridges crossing it. The city's buildings and parks are visible in the foreground and middle ground, all in a dark, muted color palette.

**THANK YOU!**

# THE CHALLENGE OF IDENTIFYING SOURCES
