## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

### Conclusions

- Grand Unified Theories (GUTs) formulated in 5 or more space-time dimensions.<sup>1</sup>

defined on  $\mathbb{R}^4 \times K$ , where  $\mathbb{R}^4$  is the usual 4-dimensional Minkowski space and  $K$  defines  $\delta$  compact extra dimensions.

- Gauge symmetry is broken using boundary conditions which violate the GUT symmetry.

# Example: 5D case

## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

- One extra dimension ( $\delta = 1$ ) compactified on  $K = \mathbb{S}^1/\mathbb{Z}_2 \times \mathbb{Z}'_2$ .

- The inverse radius  $R^{-1}$  sets the scale of compactification.

# Example: 5D case

## Introduction

## Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

- Each intrinsic  $\mathbb{Z}_2$  transformation is specified by a parity matrix  $P$  acting on the fields

$$\Phi(x^\mu, -y) = P\Phi(x^\mu, y) = \pm\Phi(x^\mu, y).$$

- Each  $P_i$  will break  $\mathcal{G} \rightarrow \mathcal{H}_i$  on one boundary, such that

$$\mathcal{G}_{4D} \equiv \mathcal{H}_i \cap \mathcal{H}_j$$

- Viable model must contain the Standard Model

$$\mathcal{G}_{4D} \supset \mathcal{G}_{SM}$$

# Example: 5D case

Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

For a given field  $\Phi(x^\mu, y)$  we can do a **KK decomposition**

## Decomposition

$$\Phi(x^\mu, y) = \underbrace{\sum_{n=0}^{\infty} \phi_+^{(n)}(x^\mu) \cos\left(\frac{ny}{R}\right)}_{\text{parity-even}} + \underbrace{\sum_{n=1}^{\infty} \phi_-^{(n)}(x^\mu) \sin\left(\frac{ny}{R}\right)}_{\text{parity-odd}}$$

- The 4D fields  $\phi_{\pm}^{(n)} \equiv$  Kaluza-Klein (KK) modes with mass of  $n/R$ .
- The Standard Model fields are the massless zero modes of  $\phi_+$ .
- For  $E \ll 1/R$ , the heavy Kaluza-Klein towers are integrated out.

**4D effective field theory**

# Gauge-Higgs Unification<sup>3 4</sup>

## Introduction

### Orbifold Stability

#### Gauge-Higgs Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

Assume a 5D gauge theory and  $A_M$  ( $M = 1, \dots, 5$ ) a gauge field

$$\underbrace{A_\mu (\mu = 1 \dots 4)}_{4\text{D}} \quad \text{and} \quad \underbrace{A_5}_{\text{extra dimension}}$$

$A_5$  behaves as a scalar field in 4D

$\equiv$  **Higgs field**

# Gauge-Higgs Unification

## Introduction

### Orbifold Stability

#### Gauge-Higgs Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

- Gauge-Higgs scalar  $A_5$  will generate masses for bulk fields when getting a VEV

$$-\frac{1}{2}F_{5\mu}F^{5\mu}$$

gauge

$$(D_M\Phi)^\dagger (D^M\Phi)$$

scalar

$$\bar{\Psi} iD_M\Gamma^M\Psi$$

fermions

- Gauge symmetry forbids a tree-level potential for  $A_5$

**one loop effective potential**

# One loop effective potential

## Introduction

## Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

The effective potential for a scalar field in 4D is given by<sup>5</sup>

$$\begin{aligned} V_{\text{eff}} &= \frac{1}{2} \sum_I (-1)^{F_I} \int \frac{d^4 p}{(2\pi)^4} \log[p^2 + m^2], \quad F_I = 0, 1 \\ &= -\frac{1}{32\pi^2} \sum_I (-1)^{F_I} \int_0^\infty dl \, l \, e^{-m^2/l} \end{aligned}$$

States appear as towers of KK modes with mass

$$m_n^2 = \frac{(n + c\alpha)^2}{R^2}, \quad c \text{ depends on the representation}$$

The field  $\alpha \sim \langle A_5 \rangle$ .

---

<sup>5</sup>I. Antoniadis, et al, New Journal of Physics 3 (2001)

# One loop effective potential

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

Summing over KK modes we find

$$V_{\text{eff}} = - \sum_I \sum_n (-1)^{F_I} \frac{1}{32\pi^2} \int_0^\infty dl l e^{-(n+c\alpha)^2/R^2 l}$$

Performing the integral leads to the finite  
result

$$V_{\text{eff}}(\alpha) = \frac{\mp 1}{32\pi^2} \frac{1}{(\pi R)^4} \mathcal{F}(c\alpha)$$

where

$$\mathcal{F}(\alpha) = \frac{3}{2} \sum_{n=1}^{\infty} \frac{\cos(2\pi n\alpha)}{n^5}.$$

# One loop effective potential

# One loop effective potential

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

Assume a model with gauge group  $\mathcal{G}$  and parities  $(P_1, P_2)$

Gauge transformation  $\Omega$  :  $A'_M \rightarrow \Omega^\dagger A_M \Omega - \frac{i}{g} \Omega^\dagger \partial_M \Omega$  **adjoint**

Boundary conditions imposed on the adjoint become <sup>6</sup>

$$A'_\mu = P'_i \cdot A'_\mu \cdot P'_i - \frac{i}{g} P'_i \cdot \partial_\mu P'_i \quad \text{where } P'_i = \Omega^\dagger P_i \Omega.$$

$$A'_5 = -P'_i \cdot A'_5 \cdot P'_i + \frac{i}{g} P'_i \cdot \partial_5 P'_i$$

Freedom to choose the gauge  $\Rightarrow \partial_M P'_i = 0$ .

$(P'_1, P'_2) \sim (P_1, P_2)$  **equivalent!**

Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

Two distinct breaking patterns

$$\begin{array}{r} \text{(I)} \quad SU(p) \times SU(q) \times SU(s) \times U(1)^2 \\ \qquad \qquad \qquad \downarrow \\ \text{(II)} \quad SU(q+s) \times SU(p-s) \times SU(s) \times U(1)^2 \end{array}$$

connected by a gauge transformation

# Orbifold stability: $SU(N)$

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

- **Global minimum check:** compute the potential and evaluate it at the two minima

## Breaking pattern (I)

$$\begin{aligned}V_{\text{eff}}(0) &\propto -s^2 - 2(p-s)s + 2qs, \\V_{\text{eff}}(1/2) &\propto -s^2 + 2(p-s)s - 2qs\end{aligned}$$

$$\Delta V_{\text{eff}} = V_{\text{eff}}(1/2) - V_{\text{eff}}(0) = 4s(p-s-q) = 4s(2p-N)$$

# Orbifold stability: $SU(N)$

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

## Breaking pattern (I)

$$\Delta V_{\text{eff}} = V_{\text{eff}}(1/2) - V_{\text{eff}}(0) = 4s(p - s - q) = 4s(2p - N)$$

We can distinguish two cases

$$p \geq N/2 \Rightarrow \text{stable vacuum}$$

$$p < N/2 \Rightarrow \text{unstable vacuum}$$

**examples:**  $SU(6) \rightarrow SU(3) \times SU(2) \times U(1)^2$

$$SU(7) \rightarrow SU(4) \times SU(2) \times U(1)^2$$

### Orbifold Stability

Gauge-Higgs Unification

One loop effective potential

Stability of  $SU(N)$

Case example:  $SU(6)$

Conclusions

Same approach as before: compute the potential and compare the zero-VEV case to the other different minima

$$\Delta V_{\text{eff}}^{(1/2,0)} = V_{\text{eff}}(1/2, 0) - V_{\text{eff}}(0, 0) = 4s(2p - N)$$

$$\Delta V_{\text{eff}}^{(0,1/2)} = V_{\text{eff}}(0, 1/2) - V_{\text{eff}}(0, 0) = 4r(2q - N)$$

$$\Delta V_{\text{eff}}^{(1/2,1/2)} = V_{\text{eff}}(1/2, 1/2) - V_{\text{eff}}(0, 0) = 4(s - r)(p + r - q - s)$$

At least one of  $\Delta V_{\text{eff}}^{(1/2,0)}$  or  $\Delta V_{\text{eff}}^{(0,1/2)}$  is **smaller than zero**

**instability of four-blocks**

# Orbifold stability: $SU(N)$

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

## Interpretation

- Four-blocks are unstable: the vacuum prefers the stable three-blocks
- The three blocks corresponding to  $(\alpha, \beta) = (1/2, 0)/(0, 1/2)$  have

$$p' = q + s \quad \text{and} \quad p'' = p + r$$

at least one is  $> N/2$  since  $p + q + r + s = N$

stable orbifold

## Summary of stability results

# Orbifold stability: $Sp(2N)$ , $SO(N)$

## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

- Analysis can be extended to other groups as well:  $Sp(2N)$ ,  $SO(N)$
- Same strategy as before for identifying stable configurations
- **New parity definitions** are needed  $\leftrightarrow$  group theory

### examples:

$$Sp(10) \rightarrow SU(3) \times SU(2) \times U(1) \times U(1)$$

$$SO(10) \rightarrow SU(3) \times SU(2) \times U(1) \times U(1)^9$$

$$SO(11) \rightarrow SO(3) \times SO(2) \times SO(6) \sim SU(2) \times U(1) \times SU(4)$$

$$SO(12) \rightarrow SU(4) \times SU(2) \times U(1) \times U(1)$$

## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

### Case example: $SU(6)$

## Conclusions

- $SU(6)$  aGUT in 5D<sup>10</sup> with  $y$  compactified on  $S_1/(\mathbb{Z}_2 \times \mathbb{Z}'_2)$
- We choose the parities

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P_2 = (\underbrace{+1, \cdots, +1}_{p=3}, \underbrace{-1, \cdots, -1}_{q=2}, \underbrace{-1, \cdots, -1}_{s=1})$$

such that  $SU(6) \rightarrow SU(3) \times SU(2) \times U(1)^2$ .

**Stable?**

$\Rightarrow p = 3 \geq N/2 = 6/2$  is satisfied

This model has a global minimum at  $\alpha = 0$ .

# Case example: $SU(6)$

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

However...

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P'_2 = (\underbrace{+1, \cdots, +1}_{p=3}, \underbrace{-1, \cdots, -1}_{q=2}, \underbrace{+1, \cdots, +1}_{r=1})$$

equivalent to

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P'_2 = (\underbrace{-1, \cdots, -1}_{p=2}, \underbrace{+1, \cdots, +1}_{q=3}, \underbrace{-1, \cdots, -1}_{s=1})$$

**not stable!**  $p < N/2$

# Case example: $SU(6)$

## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

### Case example: $SU(6)$

## Conclusions

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P'_2 = \underbrace{(-1, \cdots, -1)}_{p=2}, \underbrace{(+1, \cdots, +1)}_{q=3}, \underbrace{(-1, \cdots, -1)}_{s=1}$$

**not  
stable!**

According to our three-block results

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P'_2 = \underbrace{(+1, \cdots, +1)}_{q+s=4}, \underbrace{(-1, \cdots, -1)}_{p-s=1}, \underbrace{(-1, \cdots, -1)}_{s=1}$$

leads to a **stable vacuum**, which gives

$$SU(6) \rightarrow SU(4) \times U(1) \times U(1) \quad \text{does not contain SM}$$

# Case example: $SU(6)$

## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

### Case example: $SU(6)$

## Conclusions

- $P_2 \times P'_2$  also a possibility  $\Rightarrow$  vector-like zero modes  $\Rightarrow$  ruled out <sup>2</sup>
- All other parity combinations do not provide viable breaking patterns
- Not the only criteria: UV fixed point, SM fermions..

orbifold stability  $\equiv$  one of the consistency checks  
but others needed as well

---

<sup>2</sup>G. Cacciapaglia, arXiv:2309.10098 (2023)

# Conclusions

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

- aGUTs as an alternative to standard GUTs: 5D  $SU(N)$  models
- Viable models have to pass certain criteria  $\Rightarrow$  **orbifold stability**
- **Global minimum** of the gauge contribution entering the one-loop effective potential must be at  $\alpha = 0$
- For  $SU(N)$ : **two-blocks** and **three-blocks** with  $p \geq N/2$  are **stable**, while four-blocks are not
- The criteria of **orbifold stability** helps identify **potentially interesting models** and discards phenomenologically unrealistic scenarios
- Approach can be extended to  $Sp(2N)$  and  $SO(N)$  groups, where the results follow a similar logic

# Removing the VEV

## Introduction

## Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

The  $SU(6)$  model with

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P'_2 = \underbrace{(+1, \cdots, +1)}_{p=3} \underbrace{(-1, \cdots, -1)}_{q=2} \underbrace{(+1, \cdots, +1)}_{r=1}$$

has a global minimum at  $\alpha = 1/2$ .

$\Rightarrow$  remove the value of  $\alpha$  using a gauge transformation

$$\Omega(\alpha) = \exp\left(i \frac{g}{R} y A_5\right) = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & \cos \frac{\alpha y}{R} & \sin \frac{\alpha y}{R} \\ 0 & 0 & 0 & 0 & \sin \frac{\alpha y}{R} & \cos \frac{\alpha y}{R} \end{pmatrix}$$

# Removing the VEV

## Introduction

## Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

For  $y = \pi R$ , the gauge transformation flips the last two signs of  $P'_2$ , such that

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1)$$
$$P'_2 = (\underbrace{+1, \cdots, +1}_{p=4}, \underbrace{-1, \cdots, -1}_{q=1}, \underbrace{-1, \cdots, -1}_{s=1})$$

The 4D unbroken group will then be  $SU(4) \times U(1) \times U(1)$ .

# Equivalence classes

## Introduction

### Orbifold Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

## Conclusions

$$P_1 = (+1 \cdots, +1, +1, \cdots, +1, -1, \cdots, -1, -1 \cdots, -1),$$
$$P_2 = (\underbrace{+1, \cdots, +1}_p, \underbrace{-1, \cdots, -1}_q, \underbrace{+1, \cdots, +1}_r, \underbrace{-1, \cdots, -1}_s).$$

Certain parity configurations are equivalent:

$$P_1 \rightarrow -P_1 \Rightarrow p \leftrightarrow r, \quad q \leftrightarrow s$$

$$P_2 \rightarrow -P_2 \Rightarrow p \leftrightarrow q, \quad r \leftrightarrow s$$

$$P_i \rightarrow -P_i \Rightarrow p \leftrightarrow s, \quad q \leftrightarrow r$$

$$P_1 \leftrightarrow P_2 \Rightarrow q \leftrightarrow r$$

Equivalence classes given by gauge transformations <sup>6</sup>

$$[p, q, r, s] \sim [p + 1, q - 1, r - 1, s + 1] \sim [p - 1, q + 1, r + 1, s - 1]$$

# Stability of $Sp(2N)$ and $SO(N)$

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

- For  $Sp(2N)$  groups the Cartan generators are given by

$$X_i = \underbrace{\text{diag}(0, \dots, 0, 1, 0, \dots, 0)}_{SU(N) \text{ Cartan generator}} \otimes \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

Cartan subalgebra

$$\Omega(\theta_i) = \prod \exp(i\theta_i X_i^C) = \text{diag}(e^{i\theta_1}, \dots, e^{i\theta_N}, e^{-i\theta_1}, \dots, e^{-i\theta_N})$$

Possible parities  $\Rightarrow$

$$P^I_{Sp(2N)} = P_{SU(N)} \otimes \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \quad \theta_i = 0, \pi$$
$$P^{II}_{Sp(2N)} = P_{SU(N)} \otimes \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}, \quad \theta_i = \pm\pi/2$$

# Stability of $Sp(2N)$ and $SO(N)$

Introduction

Orbifold  
Stability

Gauge-Higgs  
Unification

One loop  
effective potential

Stability of  
 $SU(N)$

Case  
example:  
 $SU(6)$

Conclusions

- For  $SO(2N)$  groups the Cartan generators are given by

$$X_i = \underbrace{\text{diag}(0, \dots, 0, 1, 0 \dots 0)}_{SU(N) \text{ Cartan generator}} \otimes \sigma_2$$

Cartan subalgebra

$$\Omega(\theta_i) = \prod \exp(i\theta_i X_i^C) = \sum_i \text{diag}(0, \dots, 0, 1, 0 \dots 0) \otimes e^{i\theta_i \sigma_2}$$

Possible parities  $\Rightarrow$

$$P_{SO(2N)}^I = P_{SU(N)} \otimes \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \quad \theta_i = 0, \pi$$
$$P_{SO(2N)}^{II} = P_{SU(N)} \otimes \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \quad \theta_i = \pm\pi/2$$
