

SUSY AND DARK MATTER SEARCHES IN ATLAS AND CMS

T. LARI, INFN MILANO

ON BEHALF OF THE ATLAS AND CMS COLLABORATIONS

EXECUTIVE SUMMARY

We haven't found Supersymmetry

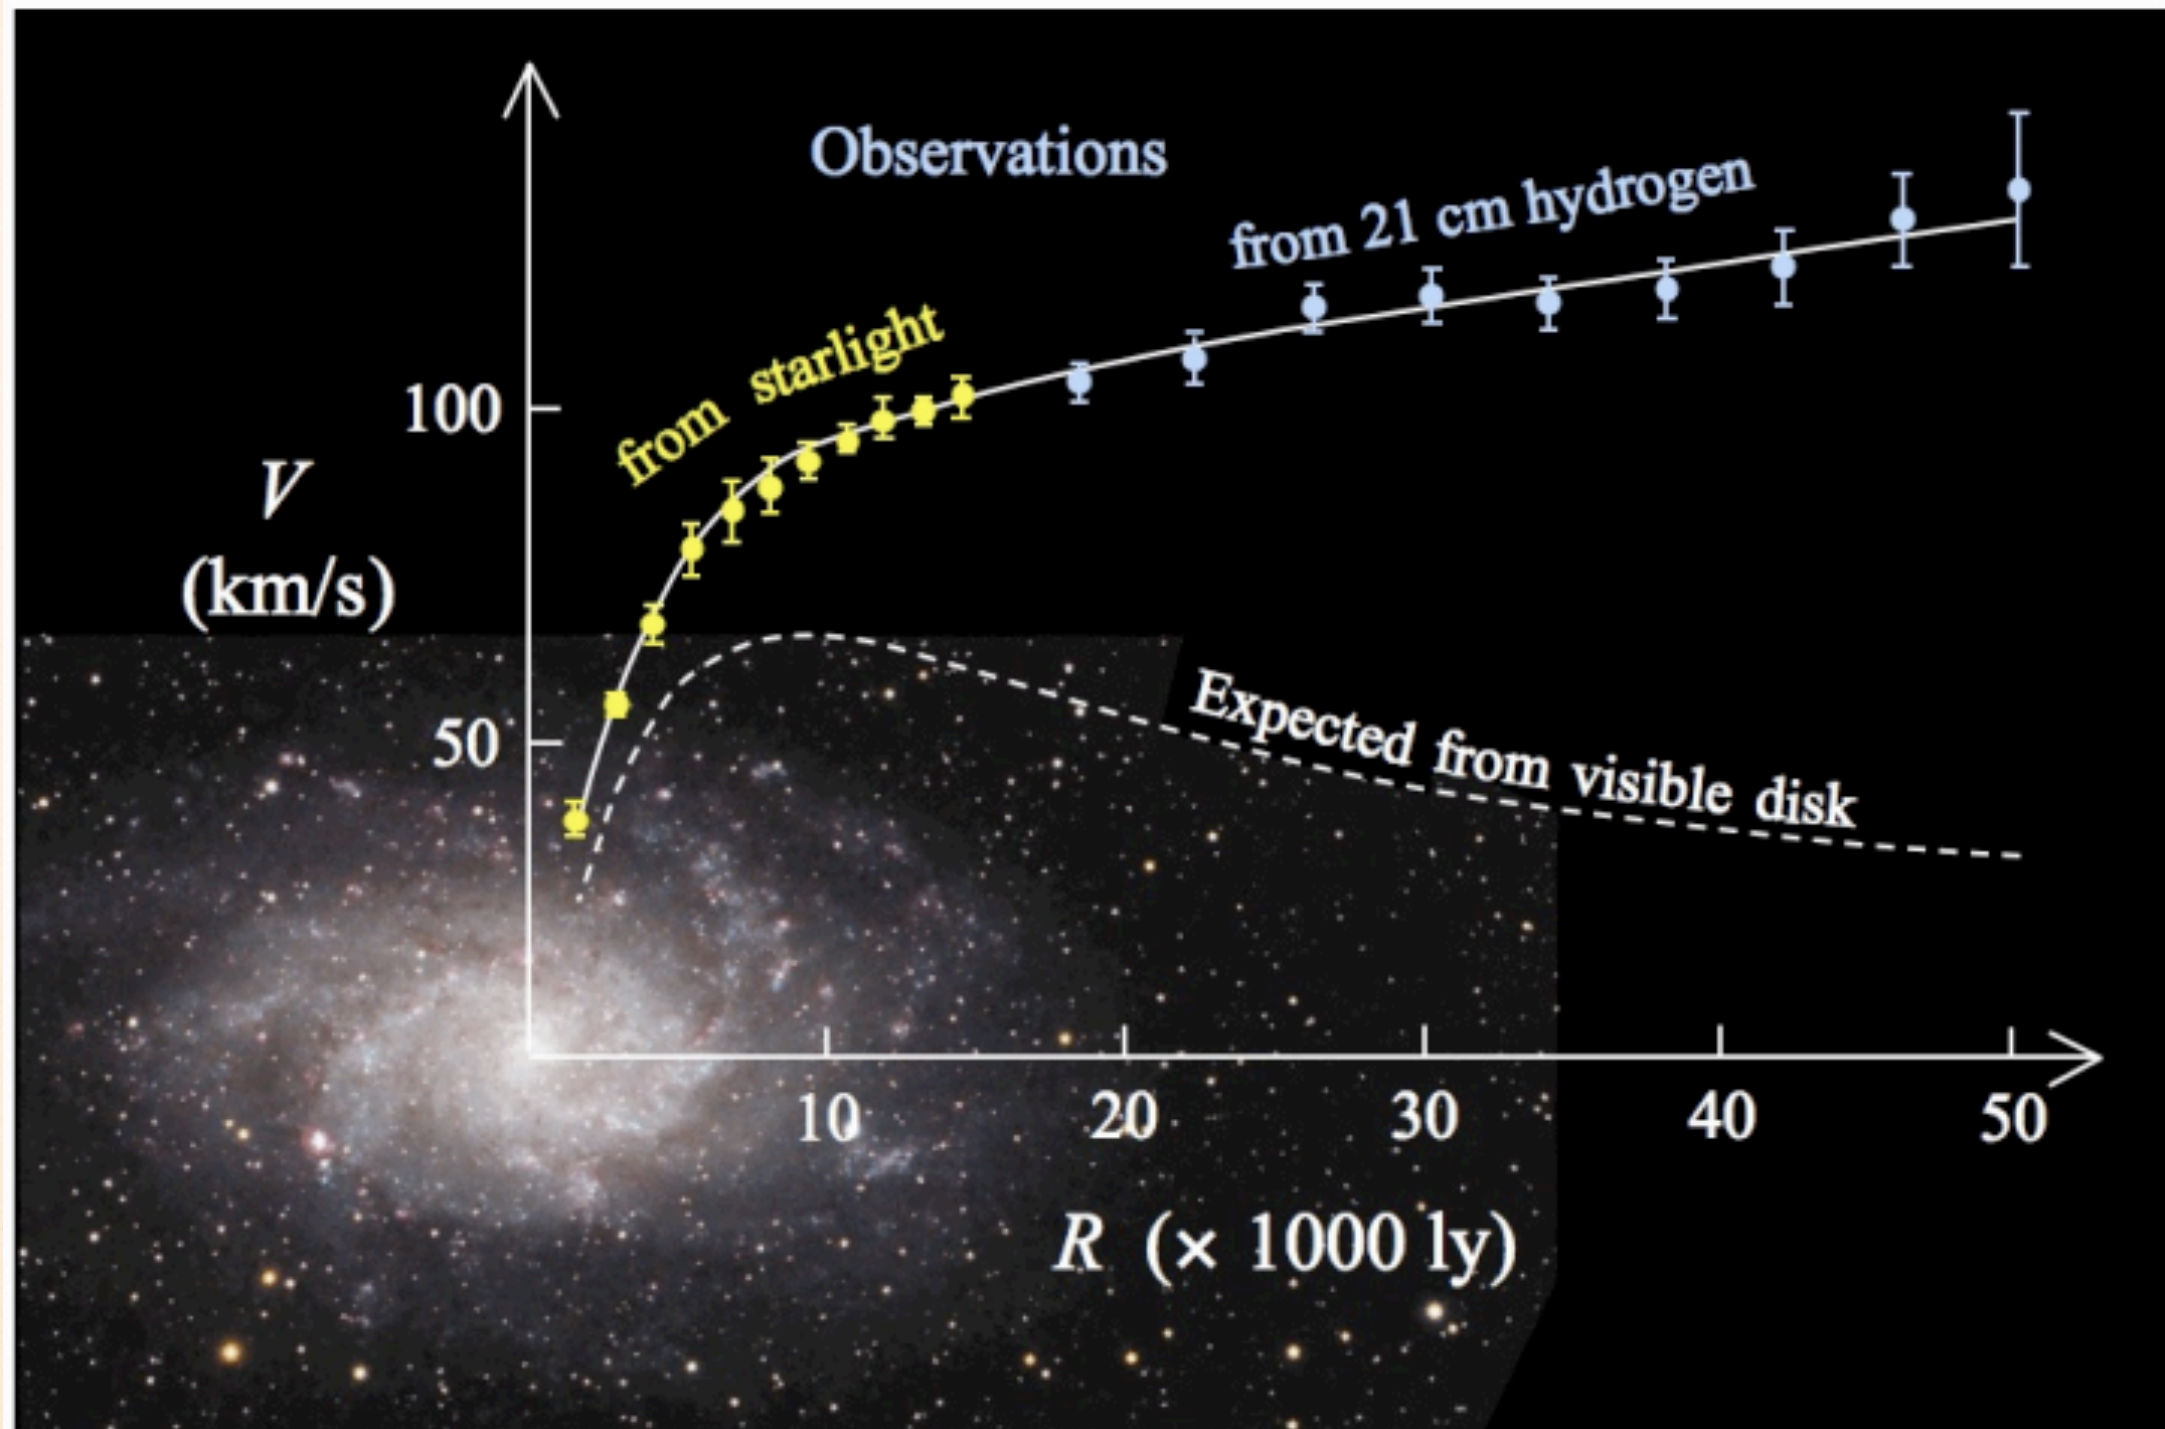

We haven't found Dark Matter either

Let me elaborate on that...

The Standard Model describes very well measurements at colliders...

Nevertheless, we know something else is out there

is it something that can be produced at colliders ?

we don't know - but we should pursue all avenues to discover the nature of Dark Matter

S-CHANNEL SPIN 1 MEDIATOR

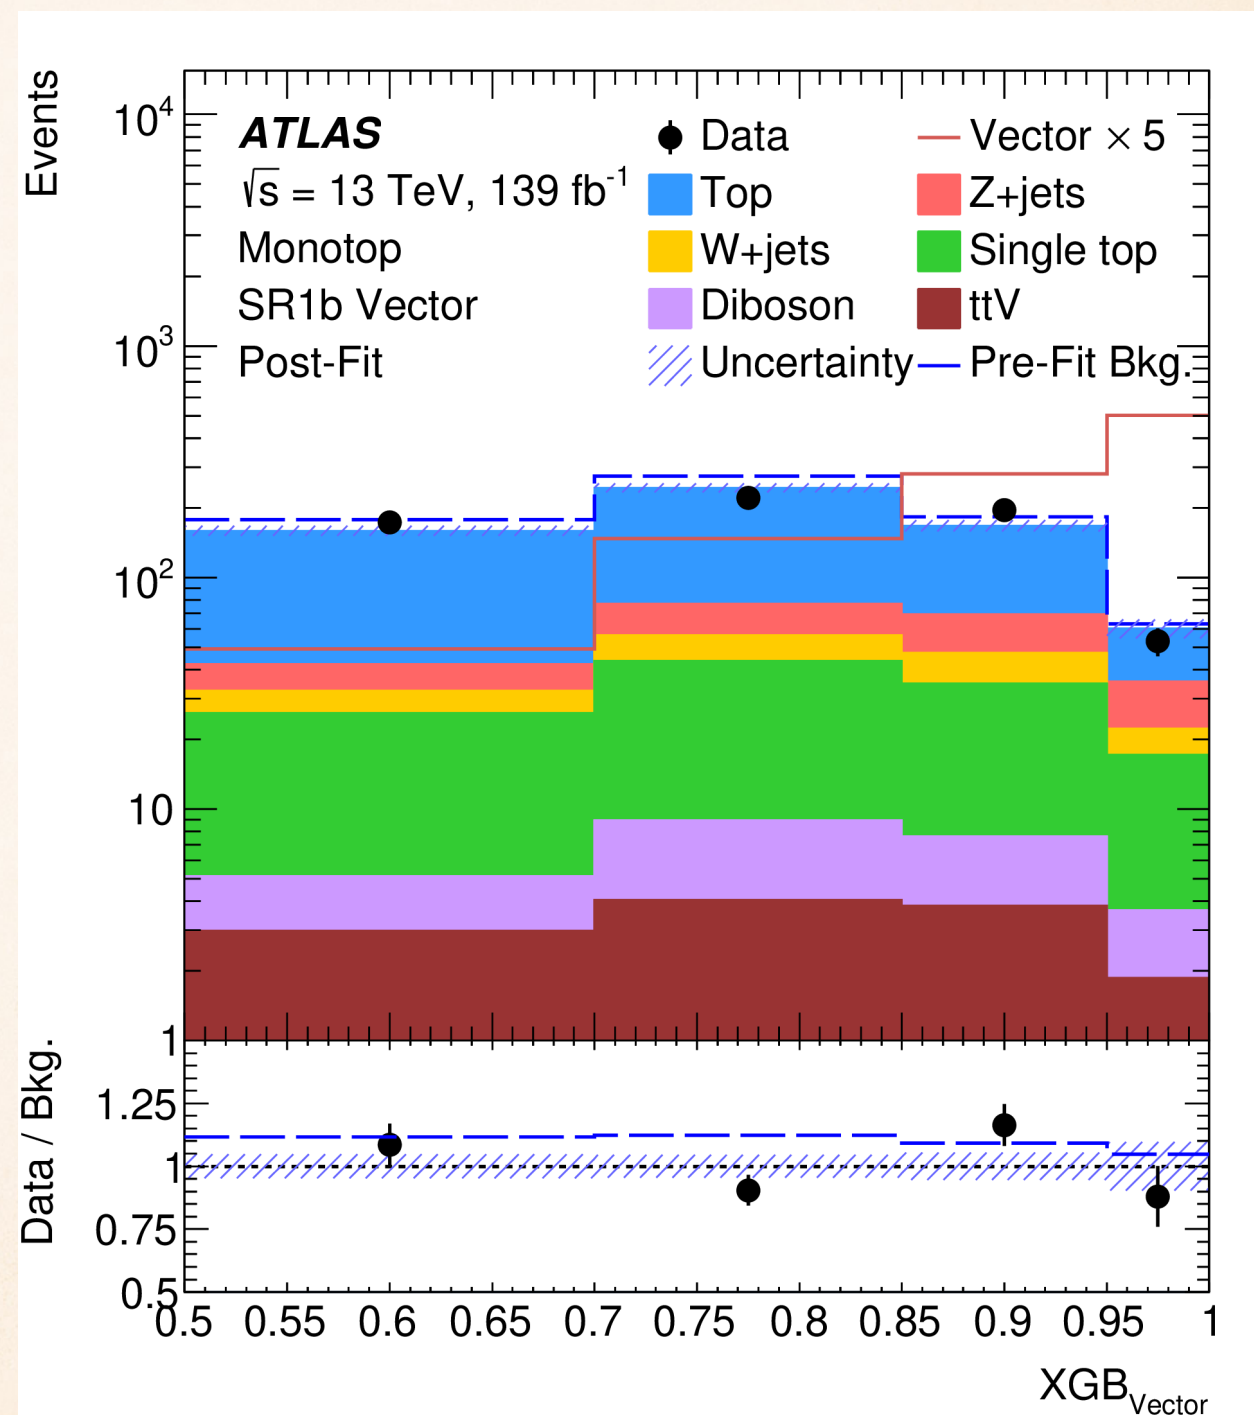

CMS DM summary plots

ATLAS corresponding plot in backup and [here](#)

ATLAS MONO-TOP

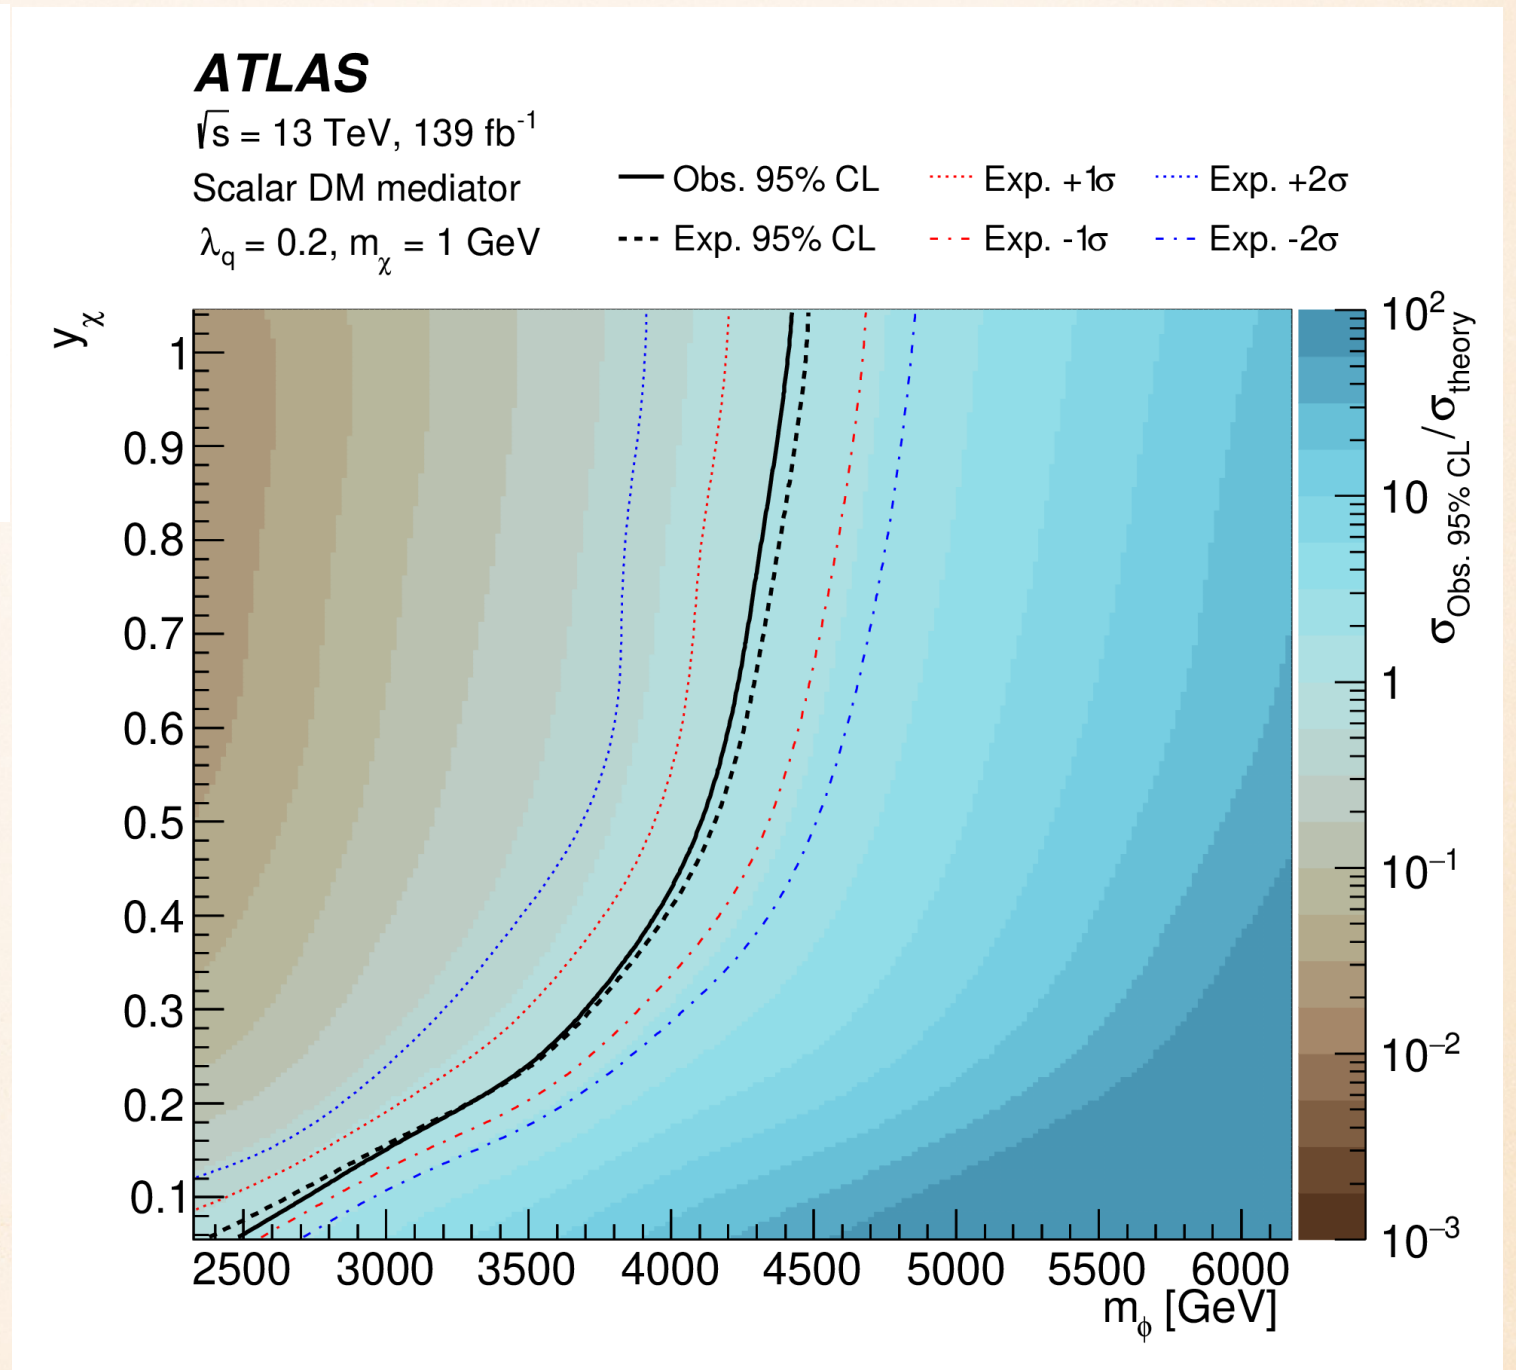

- ❖ Targets vector and scalar mediators coupling to Dark Matter
- ❖ Selection : top tagged large-R jet, large missing momentum E_T^{Miss} . BDT separates signal and background
- ❖ Background MC normalized in Control Regions

ATLAS MONO-TOP

- ❖ 2 models with 4 parameters (mediator and DM masses, quark and DM couplings)
- ❖ Limits in various 2D projections

New!

ATLAS DARK HIGGS IN BB

$m_S = 70 \text{ GeV}$
 $g_q = 0.25$
 $\sin \theta = 0.01$
 g_χ varied to match relic density

Limits in various 2D slices of parameter space

ATLAS LOW MASS DI-JETS

- Using an ISR jet or photon to trigger and access lower mass mediators
- Resonance in inclusive or b-tagged resolved jets : four channels (γjj , γbb , jjj , jbb)
- Fit smoothly falling m_{jj} spectrum

See [here](#) for the CMS jet resonance search with data scouting

New!

arXiv:2403.08547

ATLAS LOW MASS DI-JETS

New!

CMS DI-JETS SUMMARY

CMS DARK HIGGS IN WW

- ❖ Target : Dark Sector with Z' , Dark Higgs, and Dark Matter
- ❖ WW +MET in $lvqq$ and $2l$ channels
- ❖ Prompt lepton background from MC, normalized in region inverting the SR cuts

CMS DARK HIGGS IN WW

- ❖ Target : Dark Sector with Z', Dark Higgs, and Dark Matter
- ❖ $WW + E_T^{\text{Miss}}$ in $lvqq$ and $2l$ channels
- ❖ Prompt lepton background from MC, normalized in region inverting the SR cuts

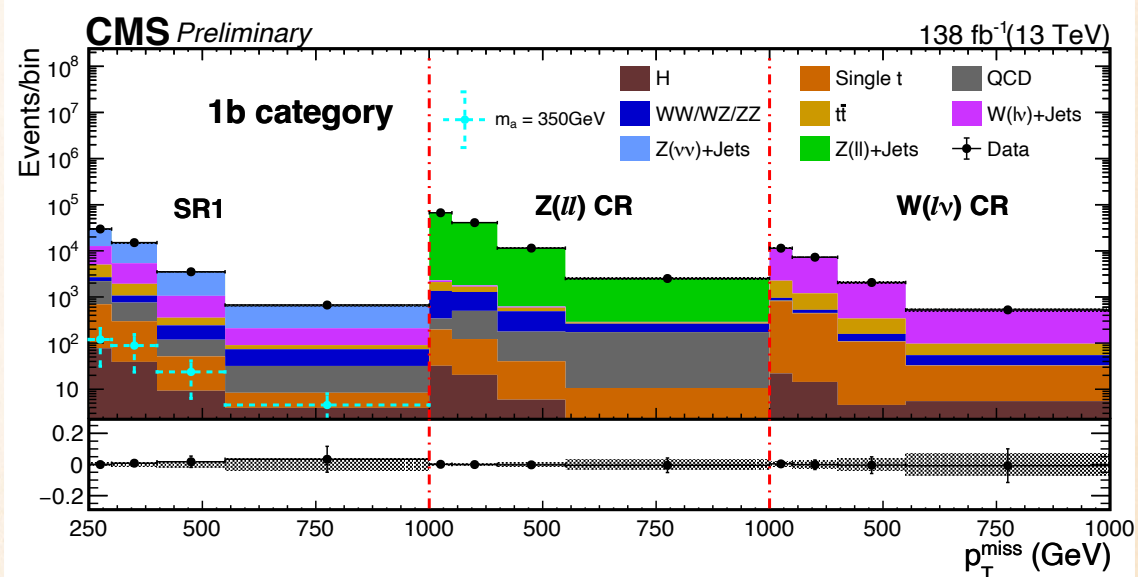

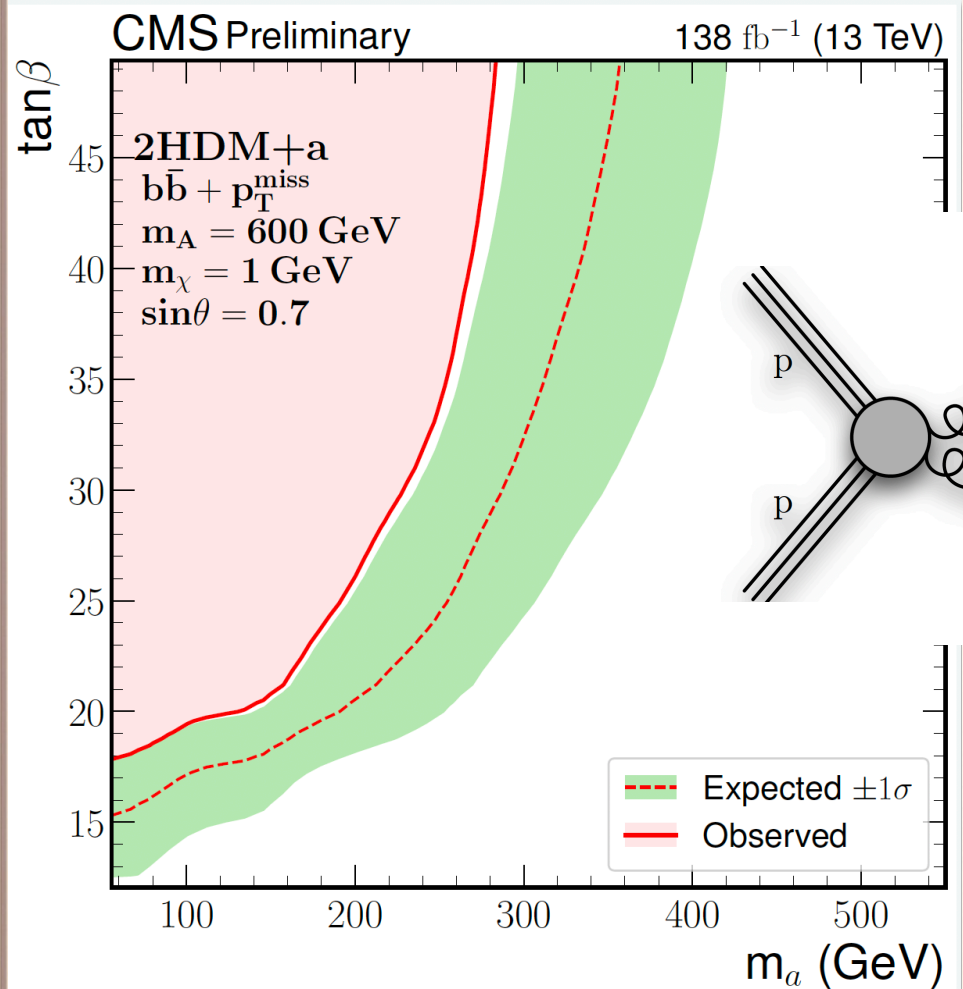

CMS DARK HIGGS IN WW

New!

CMS NEW RESULT !

❖ New $b\bar{b} + p_T^{\text{miss}}$ search, targeting 2HDM+a model

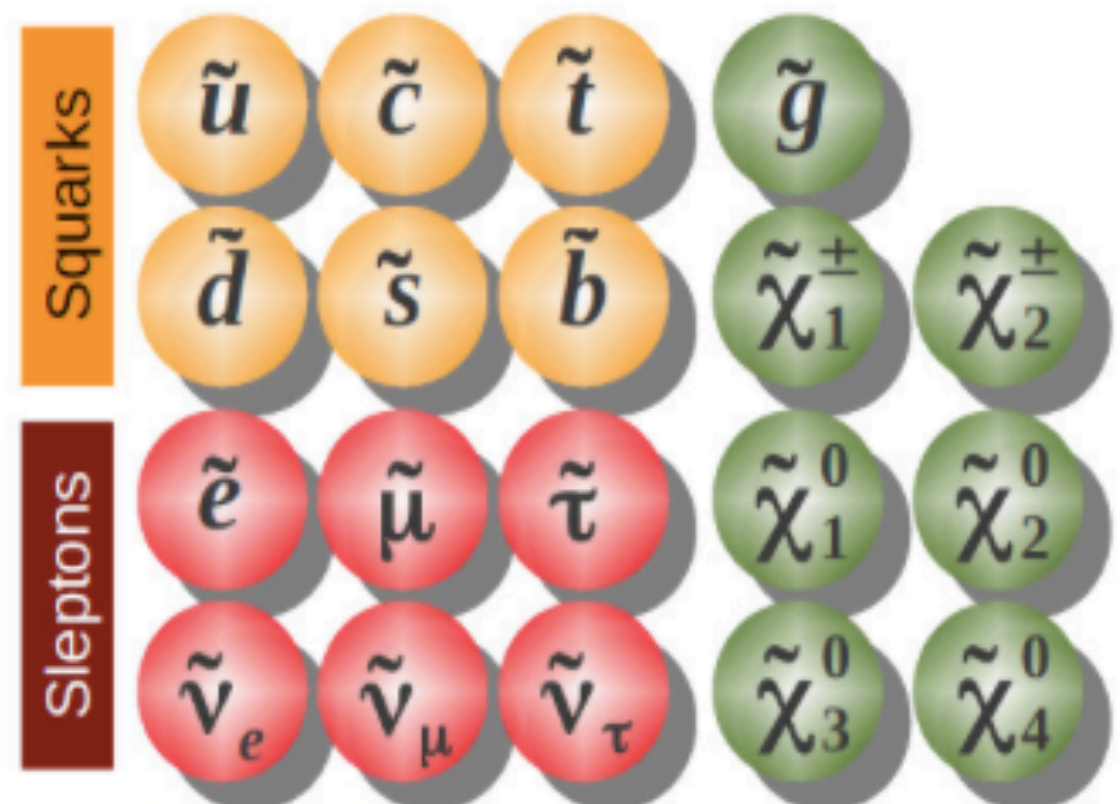

❖ Dedicated talk of Praveen Tiwari in today's YSF session

SUPERSYMMETRY

The Standard Model

Supersymmetry

Mass generation

STRONG PRODUCTION

$pp \rightarrow \tilde{g}\tilde{g}, \tilde{g} \rightarrow t\bar{t} \tilde{\chi}_1^0$

Oct 2023

- ❖ Strong limits on gluino and squark production
- ❖ Focus is shifting to difficult/unusual models, advanced analysis techniques, and combinations

ATLAS STOP 1L

- ❖ 2nd ATLAS paper with full run 2 dataset targeting stop pair production in 1 lepton channel
- ❖ Neural Networks to reconstruct top hadronic decays and S/B separation
- ❖ Optimization for smaller $\Delta m(\tilde{t}, \tilde{\chi})$
- ❖ Combination with oL channel

CMS STEALTH SUSY

Hidden sector with
nearly degenerate singlet
 S and singlino S , decay
has little p_T^{miss}

Limits on gluino and squark

CMS NEW RPV RESULT

Target :

Wino $\chi\chi$ production

LSP

RPV decay

Signature :

- ❖ 3 leptons from W,Z decays
- ❖ 2,3,4,5+ jets with/wo b-tagged jets (8 channels)
- ❖ Large S_T (sum of scalar momenta)

New!

CMS NEW RPV RESULT

Background MC (WZ+jets, ttZ+jets) corrected with jet scaling factors measured in data

Measure jet scaling in Z+jets events

New!

CMS NEW RPV RESULT

Background MC (WZ+jets, ttZ+jets) corrected with jet scaling factors measured in data

3 lepton selection wo corrections, showing excess

New!

CMS NEW RPV RESULT

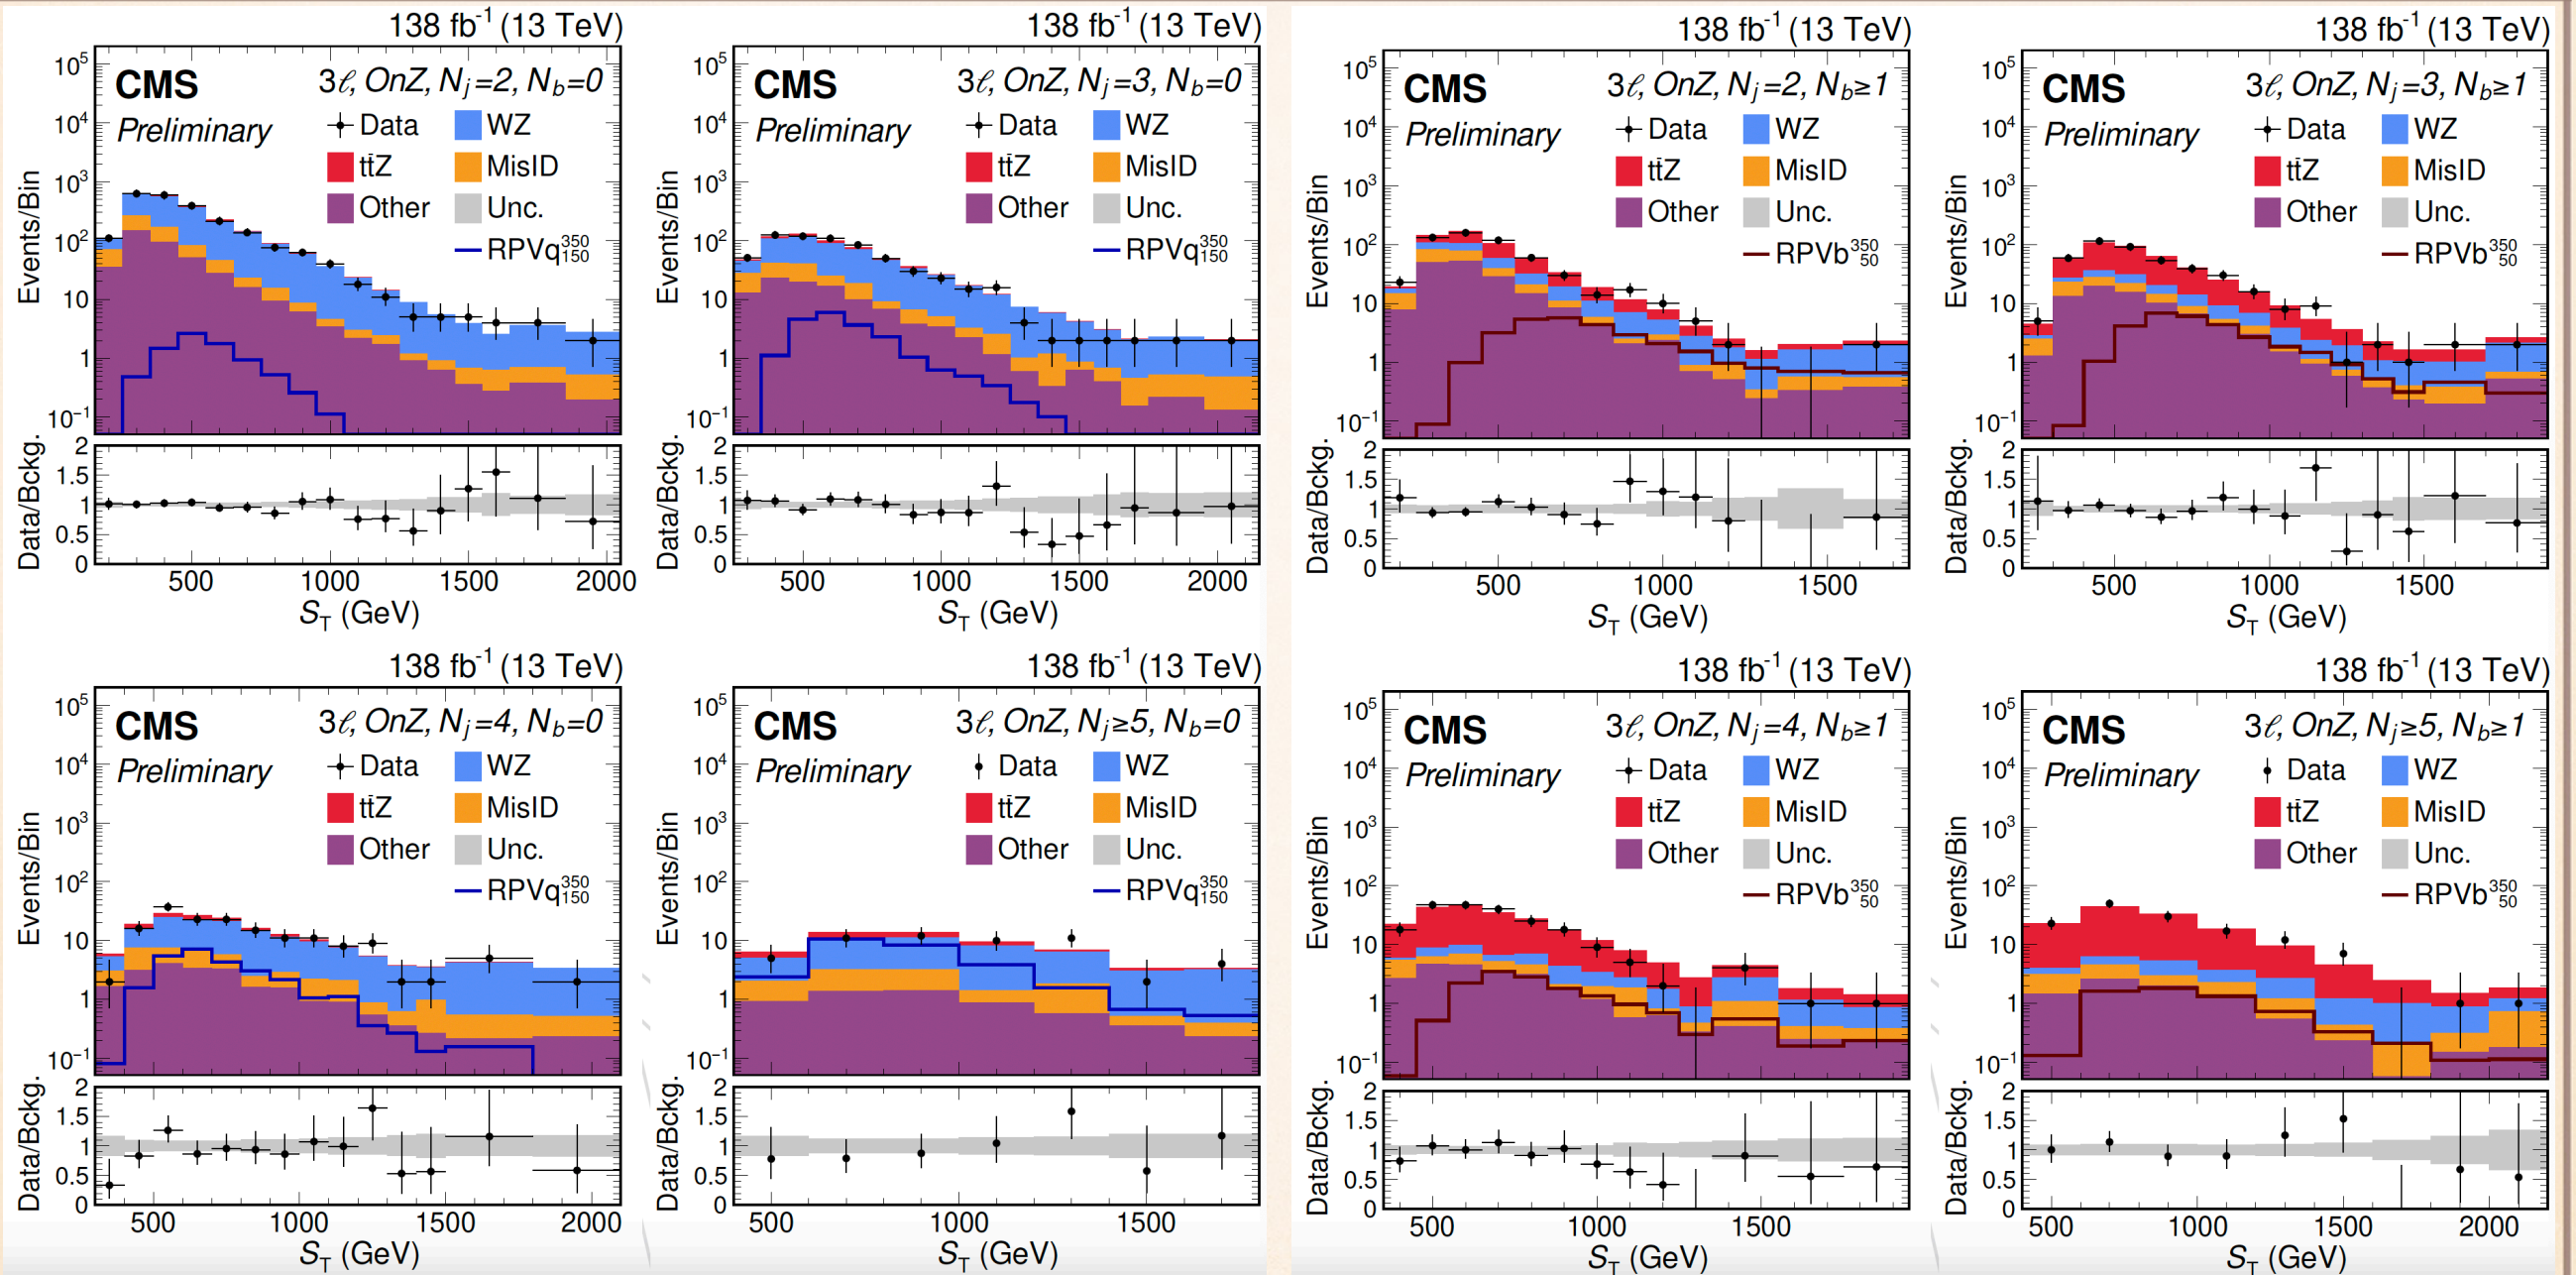

Background MC (WZ+jets, ttZ+jets) corrected with jet scaling factors measured in data

**3 lepton selection with corrections,
no excess**

New!

CMS NEW RPV RESULT

channels wo b-jets

channels with b-jets

New!

CMS NEW RPV RESULT

ELECTROWEAK PRODUCTION

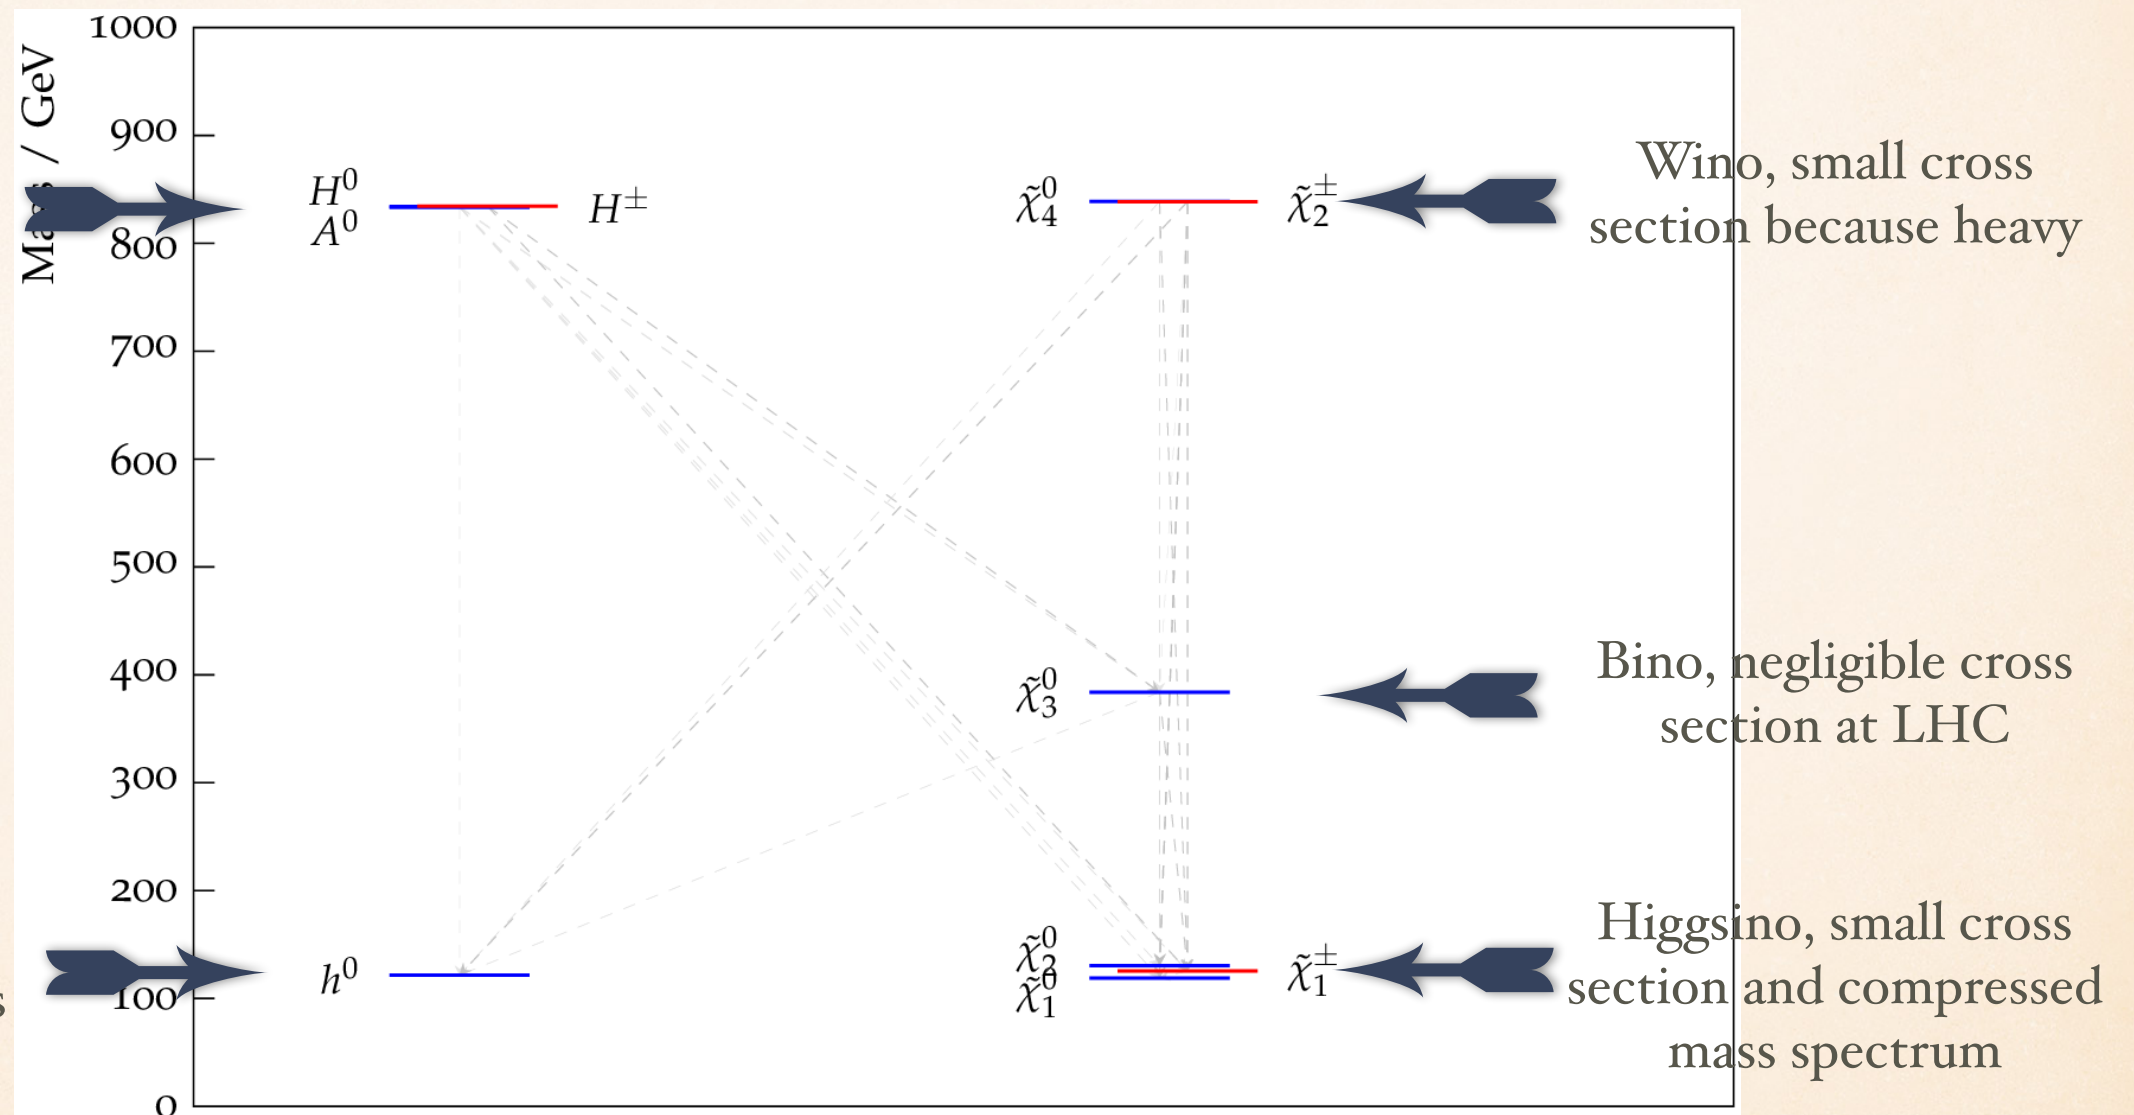

Limits from combination of several analyses.

COMPRESSED SPECTRA

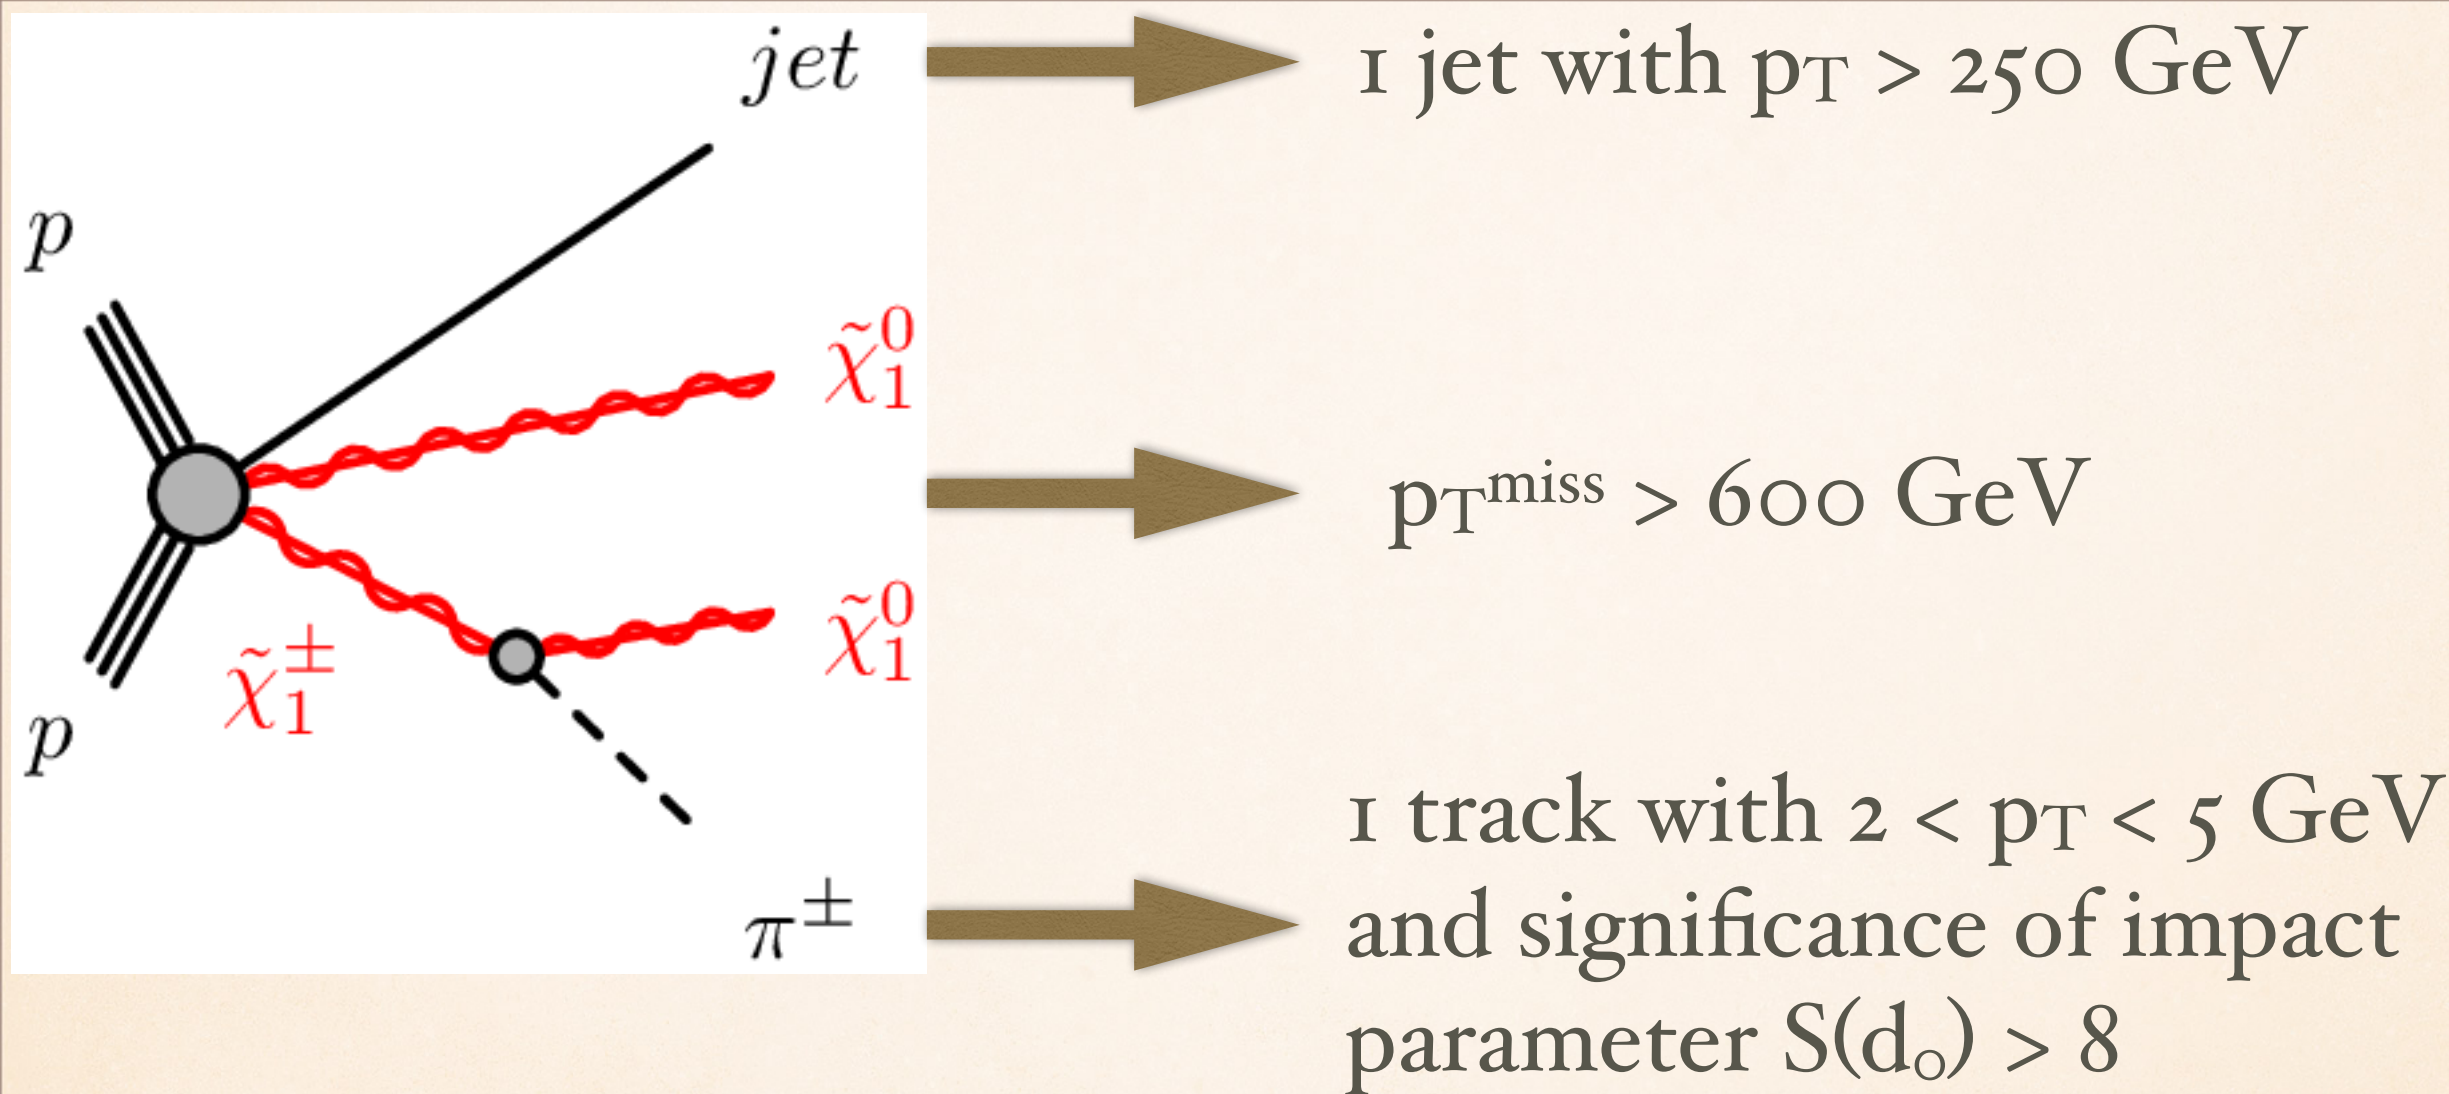

Might be in reach, depending on $\tan\beta$ and decays to SUSY particles

Observed but very similar to SM Higgs

❖ Other difficult case : EWK production + compressed mass spectrum

ATLAS DISPLACED TRACK

For $\Delta M(\chi^\pm, \chi^0) = 0.5 \text{ GeV}$, $c\tau = 4 \text{ mm}$

ATLAS DISPLACED TRACK

- ❖ QCD tracks (Mostly from $Z \rightarrow \nu\nu$ events) estimated with data driven method : S_{d_0} shape is the same in $0L$ and $1L$ ($W \rightarrow \mu\nu$ events) control selection
- ❖ Tracks from $W \rightarrow \tau\nu$ events : MC normalized to control region at higher track p_T

ATLAS DISPLACED TRACK

- ❖ Two bins in S_{d_0} (sensitive to lower/higher Δm)
- ❖ No excess in either

ATLAS DISPLACED TRACK

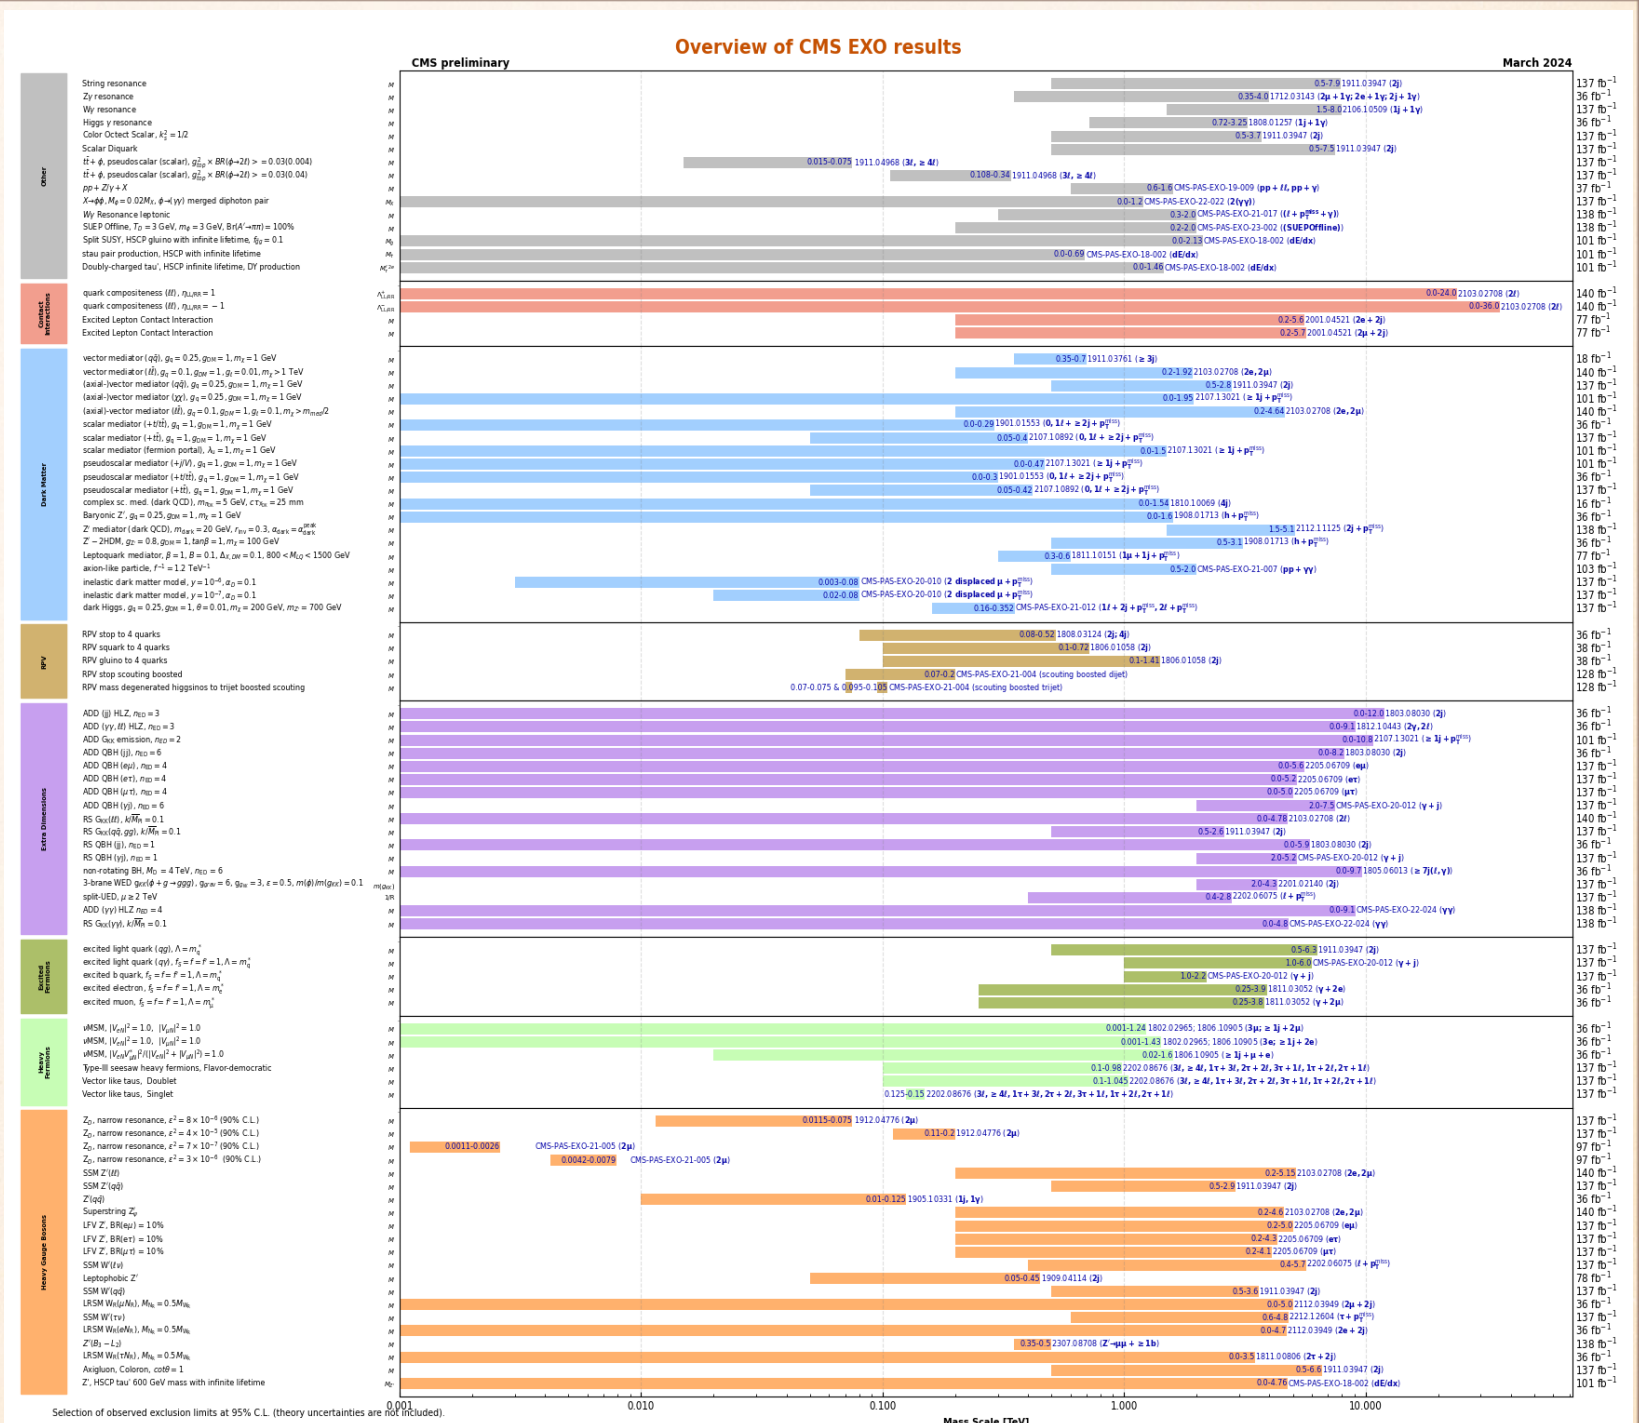

CONCLUSIONS

We haven't found it. Yet

LHC is providing more data and we keep looking in many places

Stay tuned!

BACKUP

...with a few exceptions that gives us hope, but are not yet confirmed as definitely coming from non-SM physics
