# Thanks for sending me out to Moriond EW :D

# Super-K Analysis for Diffuse Supernova Neutrino Background

DSNB  
Analysis!

- **Proposed paper** at end-of-year collaboration meeting for **SK6 (2020-2022, 0.01% Gd) full analysis** between Japanese/French groups.
- **Perform analysis with SK7 (2022-2023, 0.03% Gd) data** before summer 2024 collaboration meeting before Neutrino 2024.

("2<sup>nd</sup> reduction")

Spallation Background

("3<sup>rd</sup> reduction")

Atmospheric Background

("4<sup>th</sup> reduction")

Neutron Tagging

Model-independent  
(upper limits analysis)

Model-dependent  
(spectral analysis)

3 of 5 analyzers are at LLR: still leaders for Super-K DSNB analysis!

Spallation Background

Atmospheric Background

Neutron Tagging

Model-independent  
(upper limits analysis)

Model-dependent  
(spectral analysis)

- Alice/Sonia/Laura last worked on this from LLR.
- English groups working on MC simulation have stopped sharing updates.
- Still data-driven approach for our current analysis.

(Itsy, bitsy DSNB signal)

(Two-part inverse beta decay signal!)

(positron) + (delayed neutron capture)

# Super-K Analysis for Diffuse Supernova Neutrino Background

DSNB Analysis!

- **Proposed paper** at end-of-year collaboration meeting for **SK6 (2020-2022, 0.01% Gd) full analysis** between Japanese/French groups.
- **Perform analysis with SK7 (2022-2023, 0.03% Gd) data** before summer 2024 collaboration meeting before Neutrino 2024.

("2<sup>nd</sup> reduction")

Spallation Background

- Alice/Sonia/Laura last worked on this **from LLR**.
- **English groups** working on MC simulation have stopped sharing updates.
- Still **data-driven** approach for our current analysis.

("3<sup>rd</sup> reduction")

Atmospheric Background

- **Optimized** MSG NCQE atmospheric background **cut** since last update. (removes multi-cone backgrounds)
- Did **first cross-check** of data/MC agreement with these observables.
- **Found MC error** for one of them (counting electrons coming from invisible  $\mu/\pi$ ). (looking for decays after prompt peak)
- Working on a **"pre-activity" data/MC discrepancy** too. (looking for gammas before prompt peak)

("4<sup>th</sup> reduction")

Neutron Tagging

Model-independent  
(upper limits analysis)

Model-dependent  
(spectral analysis)

(Two-part IBD signal!)

# Super-K Analysis for Diffuse Supernova Neutrino Background

DSNB Analysis!

- **Proposed paper** at end-of-year collaboration meeting for **SK6 (2020-2022, 0.01% Gd) full analysis** between Japanese/French groups.
- **Perform analysis with SK7 (2022-2023, 0.03% Gd) data** before summer 2024 collaboration meeting before Neutrino 2024.

("2<sup>nd</sup> reduction")

Spallation Background

- Alice/Sonia/Laura last worked on this **from LLR**.
- **English groups** working on MC simulation have stopped sharing updates.
- Still **data-driven** approach for our current analysis.

(Two-part IBD signal!)

("3<sup>rd</sup> reduction")

Atmospheric Background

- **Optimized** MSG NCQE atmospheric background **cut** since last update.
- Did **first cross-check** of data/MC agreement with these observables.
- **Found MC error** for one of them (counting electrons coming from invisible  $\mu/\pi$ ).
- Working on a **"pre-activity" data/MC discrepancy** too.

("4<sup>th</sup> reduction")

Neutron Tagging

- **Re-processed** updated MC/data files with BDT.
- Did **first cross-check** of data/MC agreement for important BDT inputs.
- **Found bad treatment** of separating  $e^\pm$  of  $\mu/\pi$  decays from neutron captures. ( $\mu$ -decays/Gd-ncaptures on same timescale)
- Refining **new  $e^\pm$ /neutron capture separation**.

Model-independent  
(upper limits analysis)

Model-dependent  
(spectral analysis)

# Super-K Analysis for Diffuse Supernova Neutrino Background

## DSNB Analysis!

- **Proposed paper** at end-of-year collaboration meeting for **SK6 (2020-2022, 0.01% Gd) full analysis** between Japanese/French groups.
- **Perform analysis with SK7 (2022-2023, 0.03% Gd) data** before summer 2024 collaboration meeting before Neutrino 2024.

(“2<sup>nd</sup> reduction”)

### Spallation Background

- Alice/Sonia/Laura last worked on this **from LLR**.
- **English groups** working on MC simulation have stopped sharing updates.
- Still **data-driven** approach for our current analysis.

(“3<sup>rd</sup> reduction”)

### Atmospheric Background

- **Optimized** MSG NCQE atmospheric background **cut** since last update.
- Did **first cross-check** of data/MC agreement with these observables.
- **Found MC error** for one of them (counting electrons coming from invisible  $\mu/\pi$ ).
- Working on a **“pre-activity” data/MC discrepancy** too.

(“4<sup>th</sup> reduction”)

### Neutron Tagging

- **Re-processed** updated MC/data files with BDT.
- Did **first cross-check** of data/MC agreement for important BDT inputs.
- **Found bad treatment** of separating  $e^\pm$  of  $\mu/\pi$  decays from neutron captures.
- Refining **new  $e^\pm$ /neutron capture separation**.

### Model-independent (upper limits analysis)

- Introduced  **$CL_s$  approach**.
- Finishing **multi-phase upper limit combination** with correlated systematic uncertainties.
- Just need **comparison of energy scale** across phases.

### Model-dependent (spectral analysis)

# Super-K Analysis for Diffuse Supernova Neutrino Background

## DSNB Analysis!

- **Proposed paper** at end-of-year collaboration meeting for **SK6 (2020-2022, 0.01% Gd) full analysis** between Japanese/French groups.
- **Perform analysis with SK7 (2022-2023, 0.03% Gd) data** before summer 2024 collaboration meeting before Neutrino 2024.

("2<sup>nd</sup> reduction")

### Spallation Background

- Alice/Sonia/Laura last worked on this **from LLR**.
- **English groups** working on MC simulation have stopped sharing updates.
- Still **data-driven** approach for our current analysis.

("3<sup>rd</sup> reduction")

### Atmospheric Background

- **Optimized** MSG NCQE atmospheric background **cut** since last update.
- Did **first cross-check** of data/MC agreement with these observables.
- **Found MC error** for one of them (counting electrons coming from invisible  $\mu/\pi$ ).
- Working on a **"pre-activity" data/MC discrepancy** too.

("4<sup>th</sup> reduction")

### Neutron Tagging

- **Re-processed** updated MC/data files with BDT.
- Did **first cross-check** of data/MC agreement for important BDT inputs.
- **Found bad treatment** of separating  $e^\pm$  of  $\mu/\pi$  decays from neutron captures.
- Refining **new  $e^\pm$ /neutron capture separation**.

### Model-independent (upper limits analysis)

- Introduced  **$CL_s$  approach**.
- Finishing **multi-phase upper limit combination** with correlated systematic uncertainties.
- Just need **comparison of energy scale** across phases.

### Model-dependent (spectral analysis)

- **Comparing** upper limit **statistical treatment** with Rudolph.
- **Comparing cut optimization** with Antoine.

# Super-K Analysis for Diffuse Supernova Neutrino Background

## Final steps before analysis contributions finished!

("2<sup>nd</sup> reduction")

### Spallation Background

- Alice/Sonia/Laura last worked on this **from LLR**.
- **English groups** working on MC simulation have stopped sharing updates.
- Still **data-driven** approach for our current analysis.

("3<sup>rd</sup> reduction")

### Atmospheric Background

- **Optimized** MSG NCQE atmospheric background **cut** since last update.

- **Comparing cut optimization** with Antoine.

Backup

# Overview of pipeline for this DSNB work

# Cross-checks for DSNB SK-VI paper

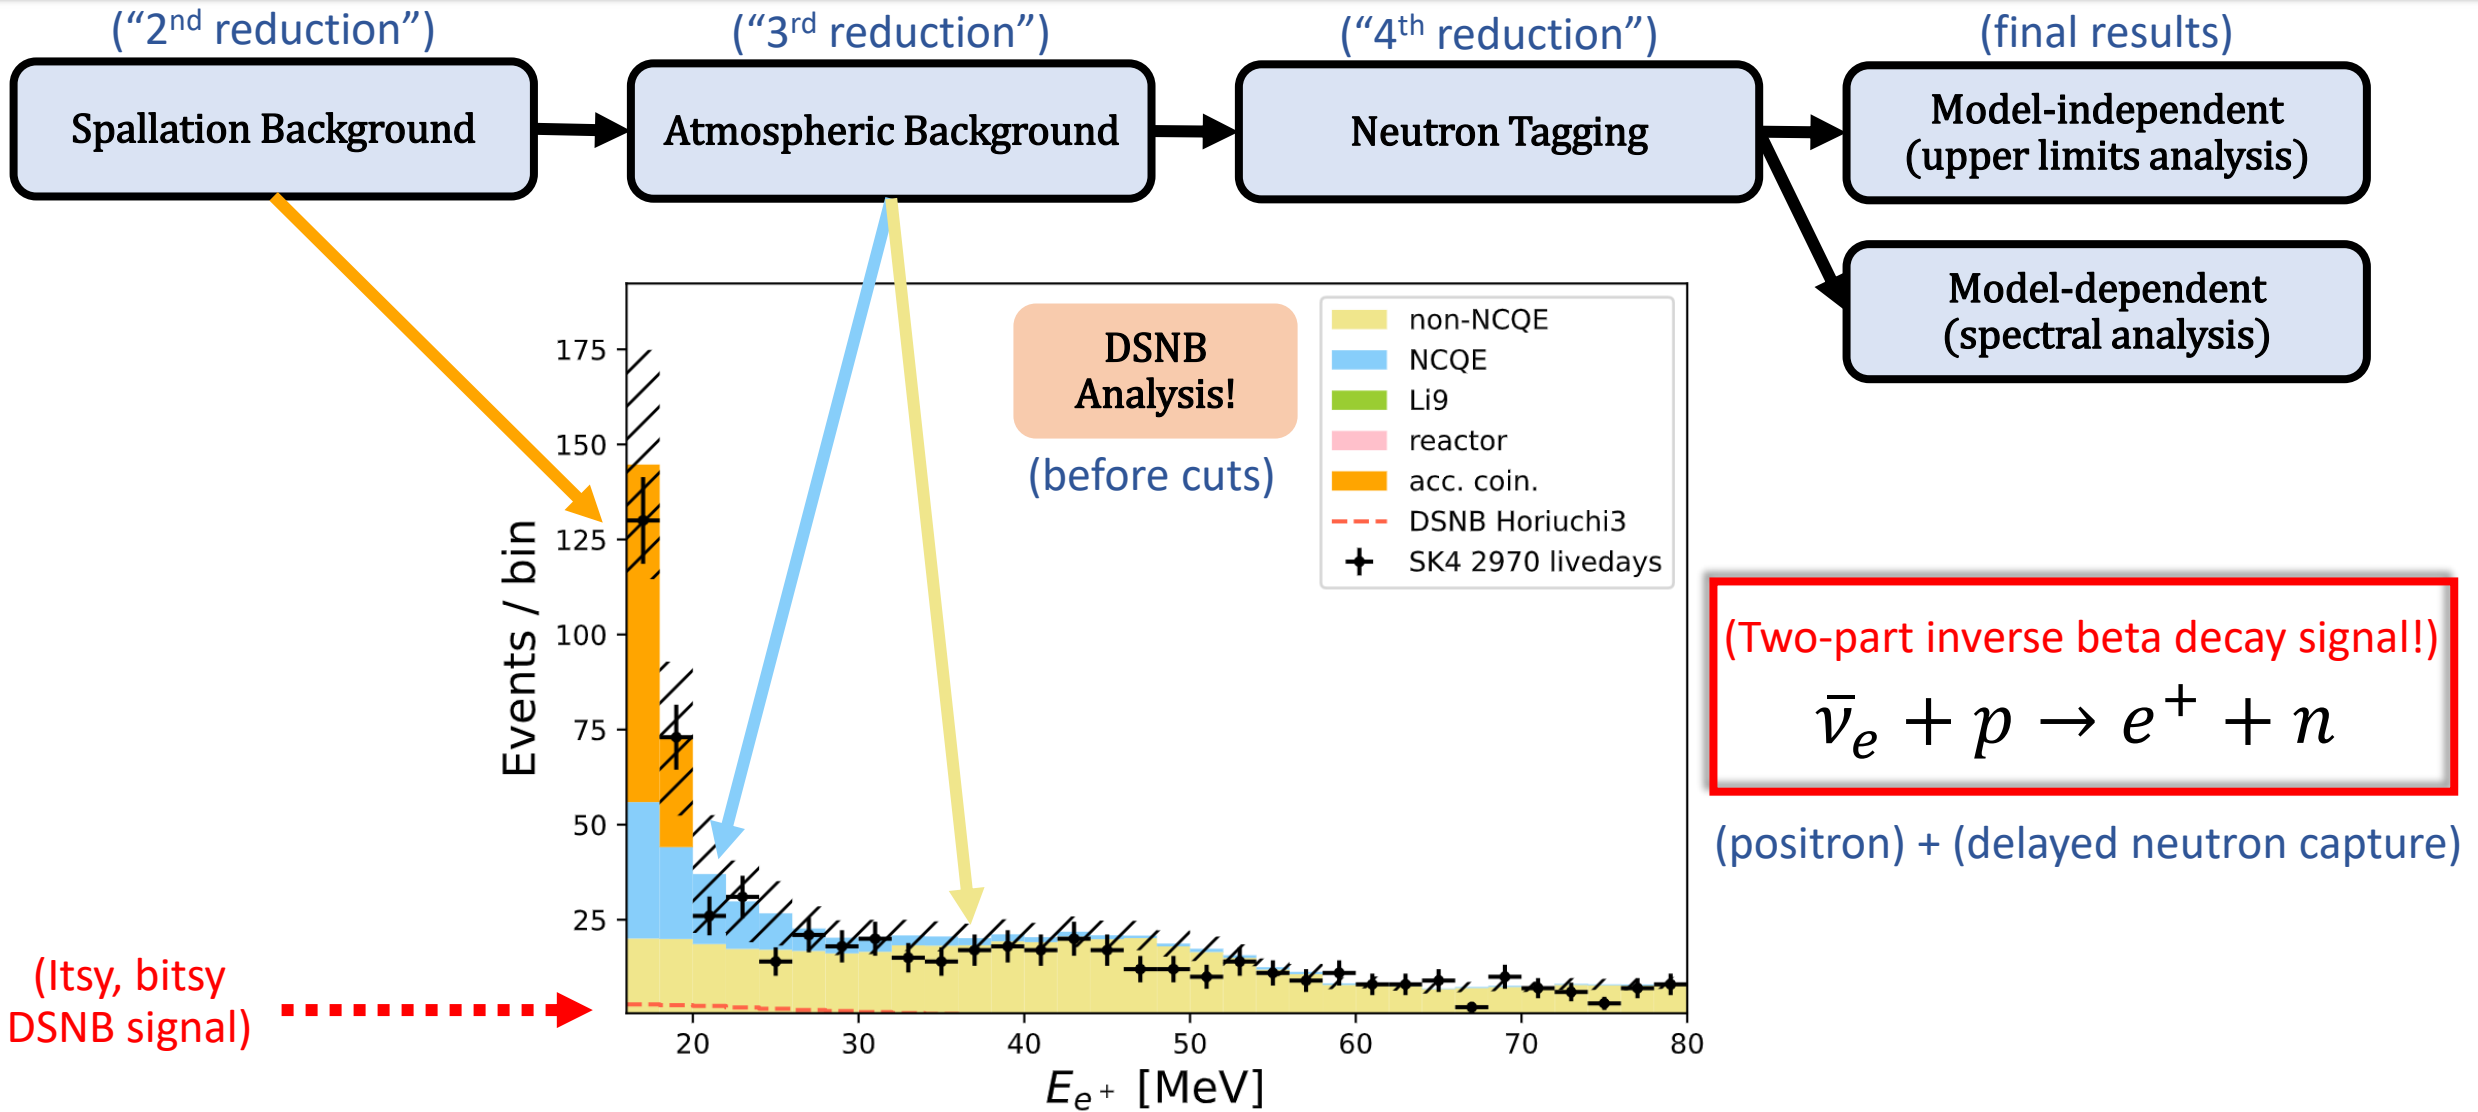

## 1<sup>st</sup>/3<sup>rd</sup> reduction checks

- dwall: Distance to wall
- effwall: Distance to wall along direction
- bsgood: Goodness of BONSAI fit
- $\theta_c$ : Cherenkov angle
- Lclear: ring “clearness”
- q50/n50: charge-to-hit ratio in 50ns
- nmue: Number of “decay electrons”
- maxpre: maximum pre-activity for a sample

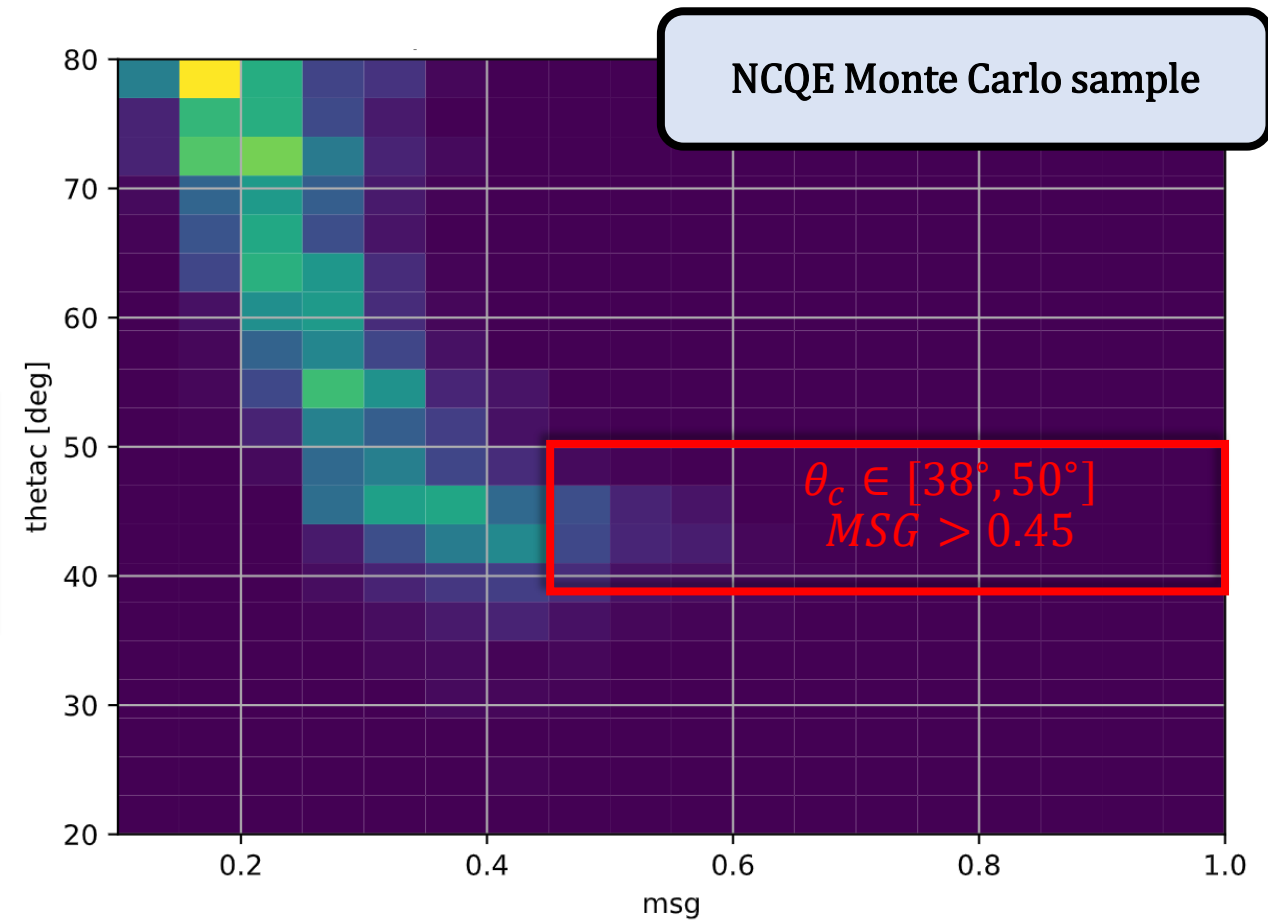

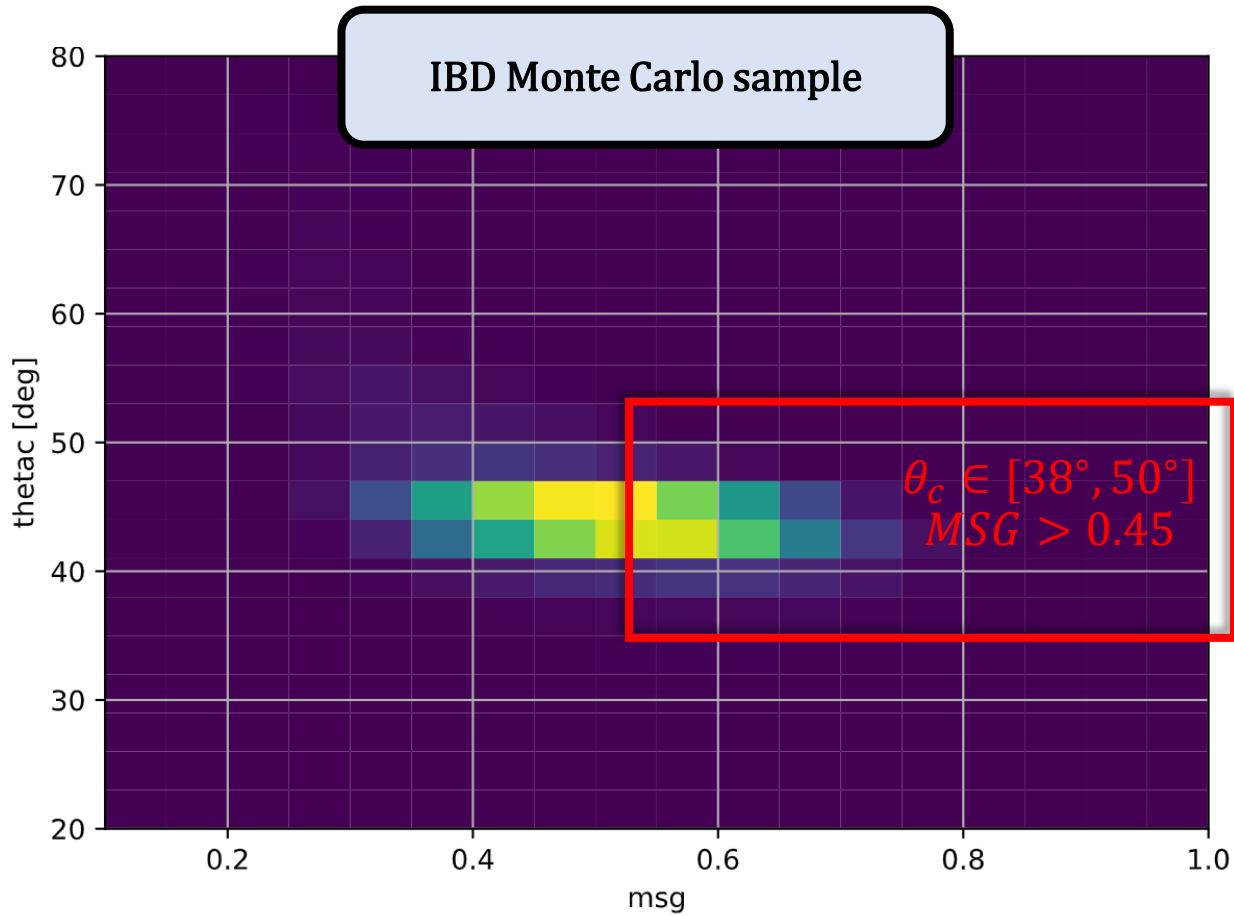

## Neutron tagging checks

- Neutron multiplicity for CC-dominated samples
- Neutron multiplicity for NC-dominated samples
- BDT discriminatory variables

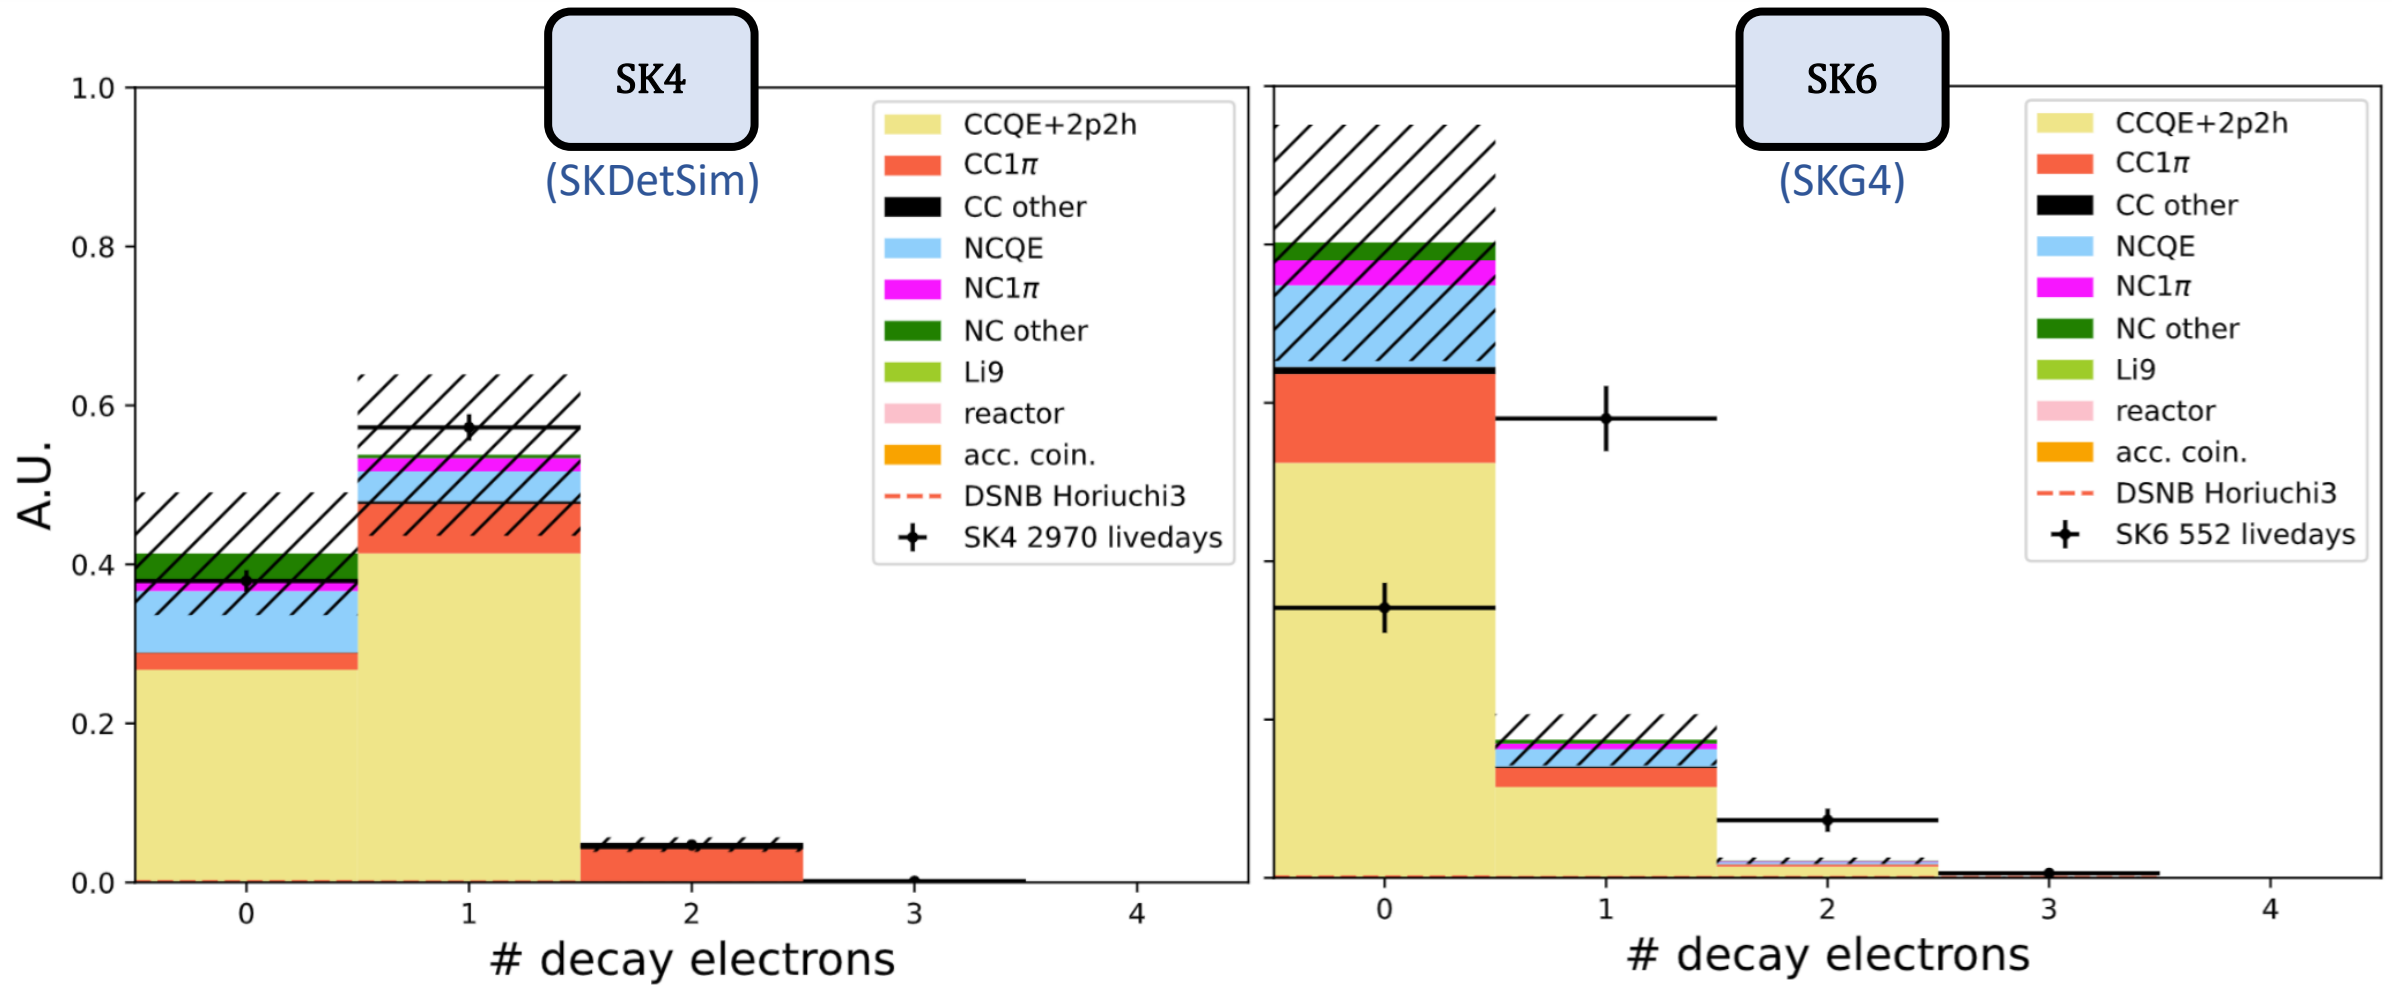

# Super-K Analysis for Diffuse Supernova Neutrino Background

# MSG cut for reducing NCQE backgrounds for DSNB analysis

# SK4/SK6 cross-checks: “decay electron” ( $n_{\mu e}$ )

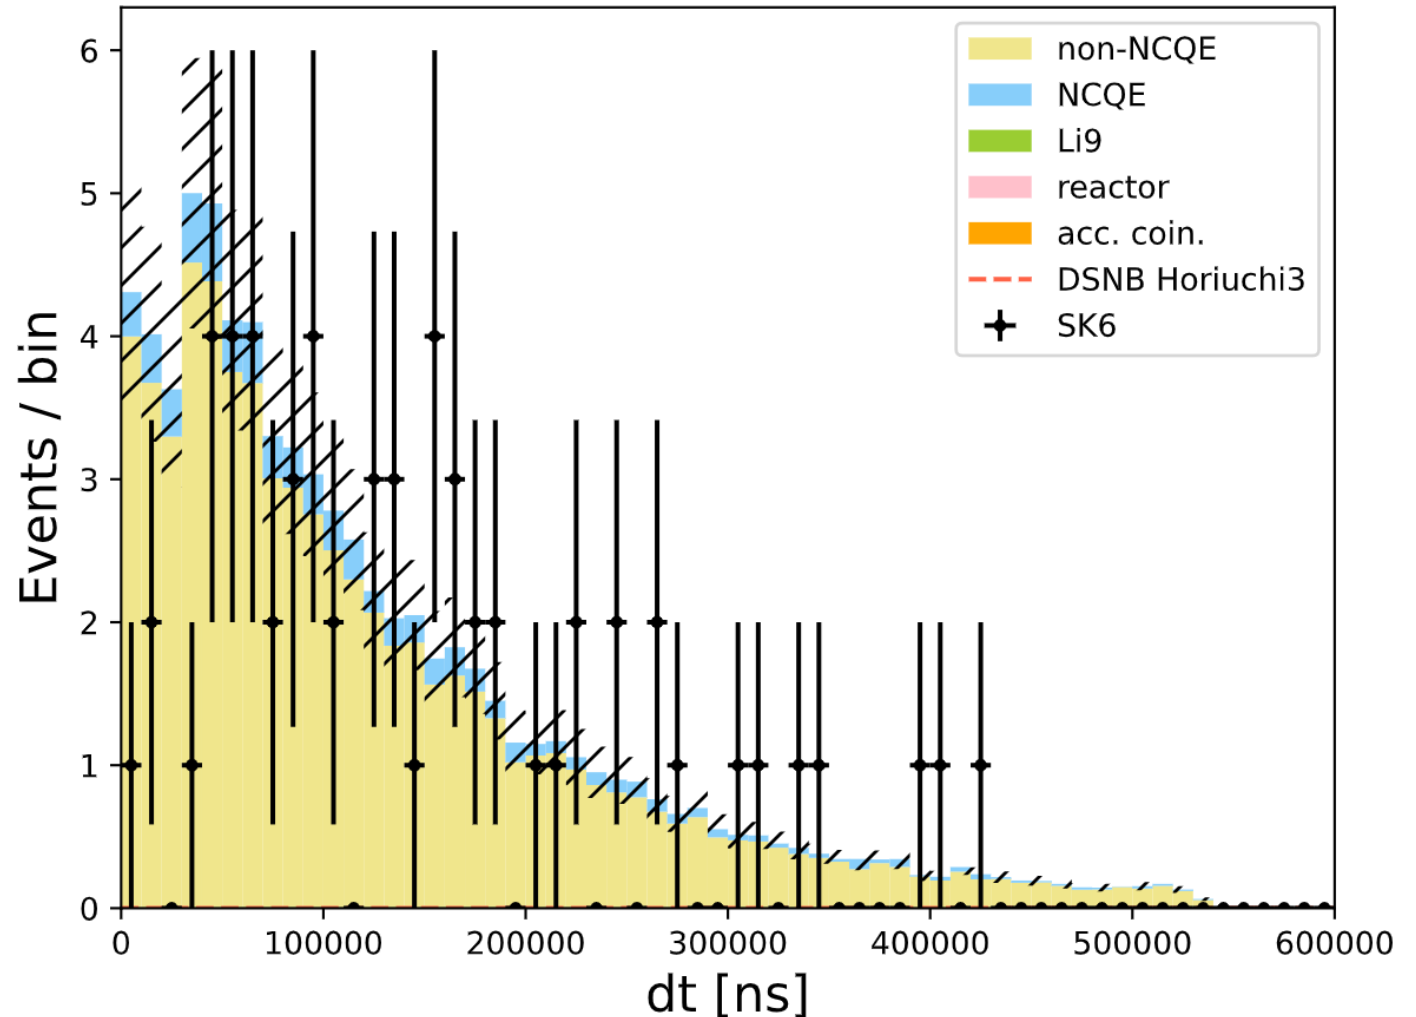

# Simple selection steps (and comparison with APFit method)

## Pre-selection

- $E \in [30, 80]$  MeV bsenergy
- $d_{wall} > 200\text{cm}$ ,  $b_{sgood} > 0.5$
- $eff_{wall} > \max(300, 500 - 50 \cdot (E[\text{MeV}] - 16))$  cm
- $nmue = 0$

## APFit Method

- Candidates need **more than 50 hits in 50 ns in t**.
- You can **see early time window** scanned up until **around 30  $\mu\text{s}$**  which **diminishes** total number of **ncaptures tagged** by the BDT.

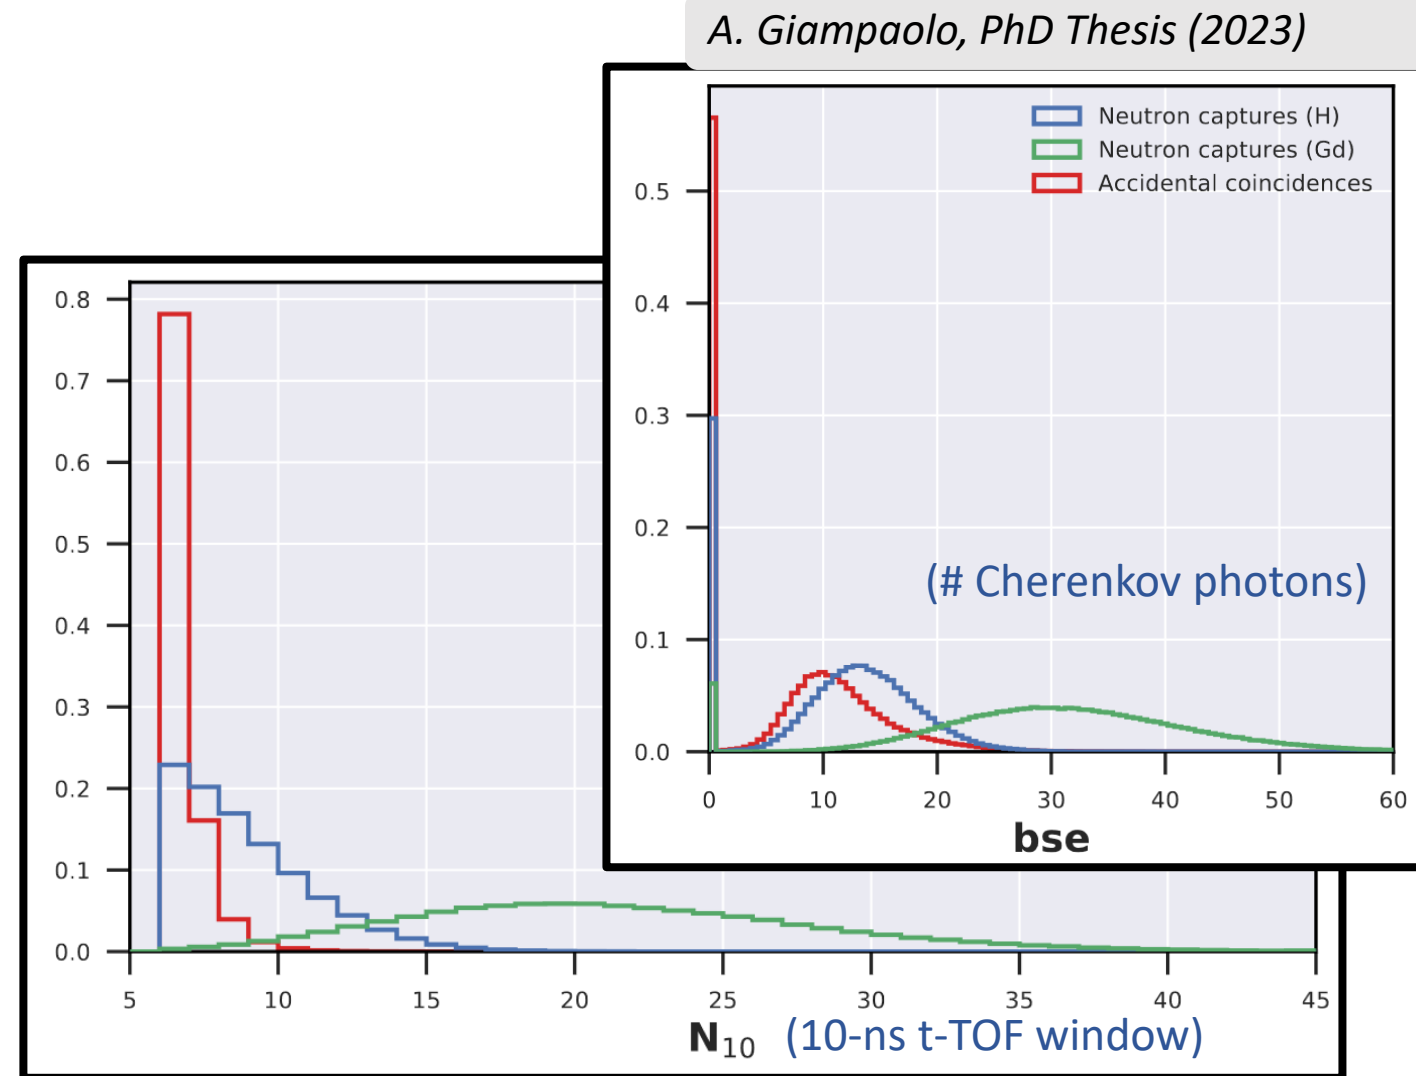

# Simple selection steps (and comparison with APFit method)

## APFit Method

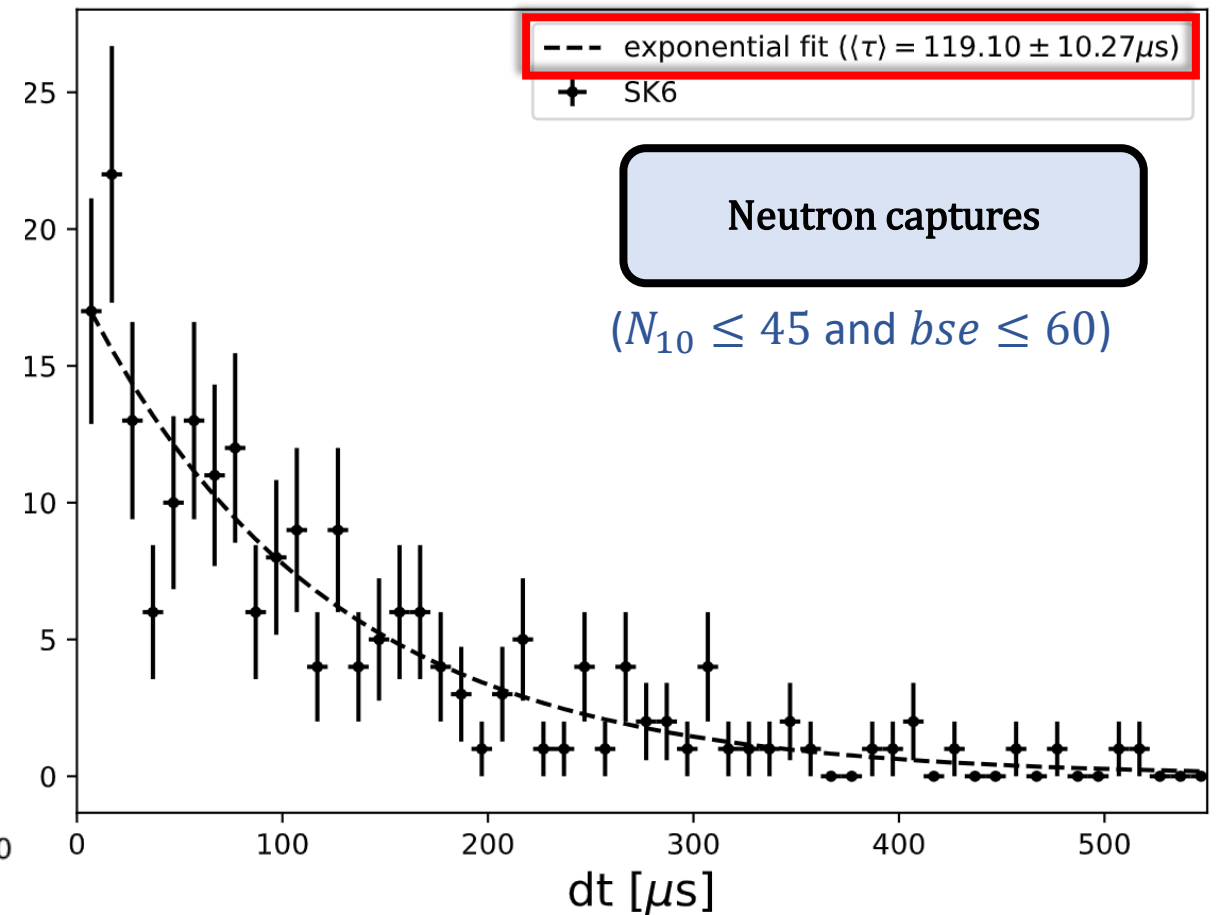

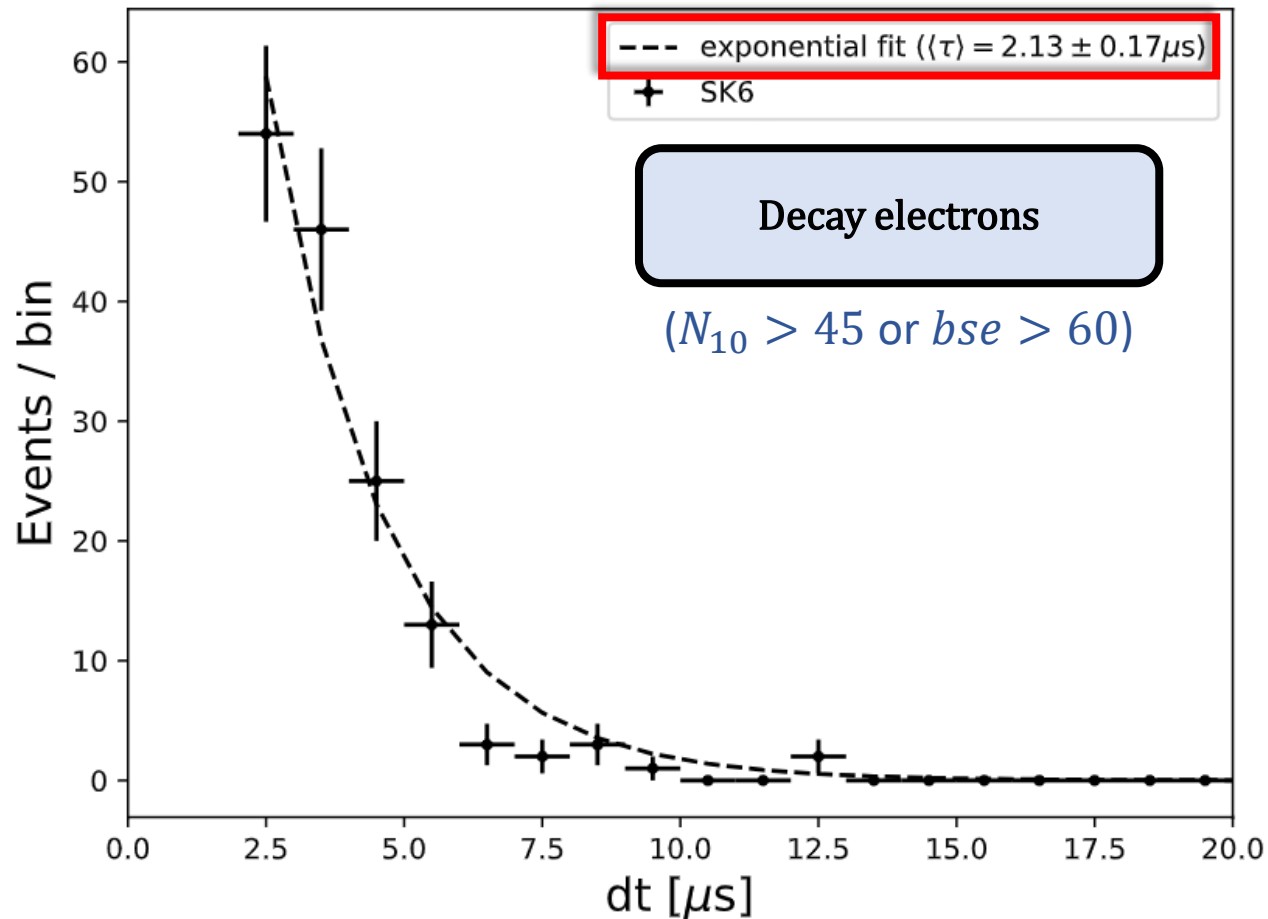

- Candidates need **more than 50 hits in 50 ns in t.**

## New lowE Method

- Move to **t-TOF** since CCQE invisible muon distance from prompt before decay is comparable to neutron capture.
- BDT neutron tagging approach already calculates **22 variables** to distinguish from dark noise backgrounds.
- **Select  $N_{10} > 45$  or  $bse > 60$  as decay-e.**
- $N_{10}$  here is lower threshold than APFit approach (since t-TOF).

# Data checks of ncapture/decaye separation in SK6

- **Decay-e sample** timing  $\tau = 2.1 \pm 0.2\mu\text{s}$  **consistent** with  $\mu$ -decays.
- **Neutron capture sample** timing  $\tau = 119.1 \pm 10.3\mu\text{s}$  **consistent** with half captures on Gd, half on protons.

# Old: Update given in October 2023

DSNB  
Analysis!

- Propose paper at end-of-year collaboration meeting for **SK6 (2020-2022, 0.01% Gd) full analysis** between Japanese/French groups.
- Perform analysis with **SK7 (2022-2023, 0.03% Gd) data** before summer 2024 collaboration meeting before Neutrino 2024.

("2<sup>nd</sup> reduction")

Spallation Background

- Member from **English group developing MC samples** (usually estimate using only data).
- **Japanese PhD and postdoc newly involved** in cuts and checking data in even lower energy regions.

("3<sup>rd</sup> reduction")

Atmospheric Background

- **Andrew developed new cut** capable of removing ~99% of main background with more than 75% of signal.
- **Japanese and English colleagues recreating and validating** a Convolutional Neural Network (**CNN**) to remove same background.

("4<sup>th</sup> reduction")

Neutron Tagging

- **LLR BDT** still most effective data/MC-validated tool.
- **Japanese group** developed less performant, **cut-based algorithm** used for preliminary SK6 results.
- **Japanese and English colleagues** testing a **neural network approach** but having issues with data/MC agreement.

Model-independent  
(upper limits analysis)

- Japanese PhD student (now postdoc in SK) **published first SK6 result**.
- Andrew acquired analysis and **completed SK6 results with new cut and Alberto's neutron tagging BDT**.

Model-dependent  
(spectral analysis)

- **SK6 preliminary results shown** to Super-K by Alberto in 2022.
- **Antoine took over from Alberto/Sonia's leadership** to complete SK1-4+SK6.
