

# THz dynamics of an antiferromagnet at the nanoscale

CASTILLO GUERRERO Adán  
LEROY Victor

IPCMS, under supervision of Drs. M. Bailleul &  
P. Noel

# Introduction

# THz domain

Domain of light:

$$\nu \rightarrow 1\text{THz} = 10^3\text{GHz}$$

$$\lambda \rightarrow 1\text{THz} \approx 300\mu\text{m}$$

**Figure** : location of the THz gap in the electromagnetic spectrum (Khiabani, 2019).

THz gap

technological gap

0.1 → 30THz

# THz gap

technological gap

0.1  $\rightarrow$  30THz

- Commercial GHz emission:

**100mW** at 10 GHz ( 5G home router)

# THz gap

technological gap

$0.1 \rightarrow 30\text{THz}$

- Commercial GHz emission:

**100mW** at 10 GHz ( 5G home router)

- State of the art THz emission:

**10 $\mu$ W** at 500GHz (TeraScan 1550)

# THz gap

technological gap

0.1  $\rightarrow$  30 THz

- Commercial GHz emission:

**100mW** at 10 GHz ( 5G home router)

- State of the art THz emission:

**10 $\mu$ W** at 500GHz (TeraScan 1550)

Requirements become bigger and expensive very fast

**Figure** : THz production at SOLEIL (Evain, 2019).

# THz gap

technological gap

0.1 → 30THz

- Commercial GHz emission:

**100mW** at 10 GHz ( 5G home router)

- State of the art THz emission:

**10μW** at 500GHz (TeraScan 1550)

Requirements become bigger and expensive very fast

**THz tech is on his infancy**

**To breach it  
Materials !**

# Antiferromagnets

Solid state lecture reminder:

$$H = -\gamma \sum_{i,j} J_i^z J_j^z + g\mu_B B \sum_i J_i^z - W_{\text{anis}}$$

exchange                      external field                      anisotropy

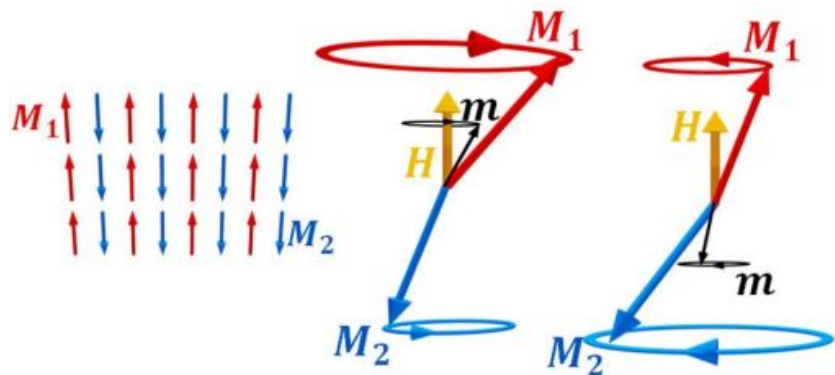

**Figure** : NiO crystal structure  
(S. Rezende, et. al, 2019).

# Antiferromagnetic resonance

Application of external magnetic field

Spin precession around equilibrium positions

**Figure** : Precessions of the two modes of antiferromagnetic resonance (P. Noël, 2023).

**Figure** : NiO crystal structure (S. Rezende, et. al, 2019).

$$\omega_{res} = \gamma\mu_0\sqrt{2H_A H_E} \pm \gamma\mu_0 H$$

$$\approx 0.1 - 2\text{THz}$$

How can we measure AF resonance ?

How can we measure AF resonance ?

And how can we improve upon it ?

# Outline

1. Experimental setup :
  - Refractive index
  - NiO resonance

2. Improving measures :
  - Planar antennas
  - Optimization + testing

3. Conclusion

# I. Experimental setup

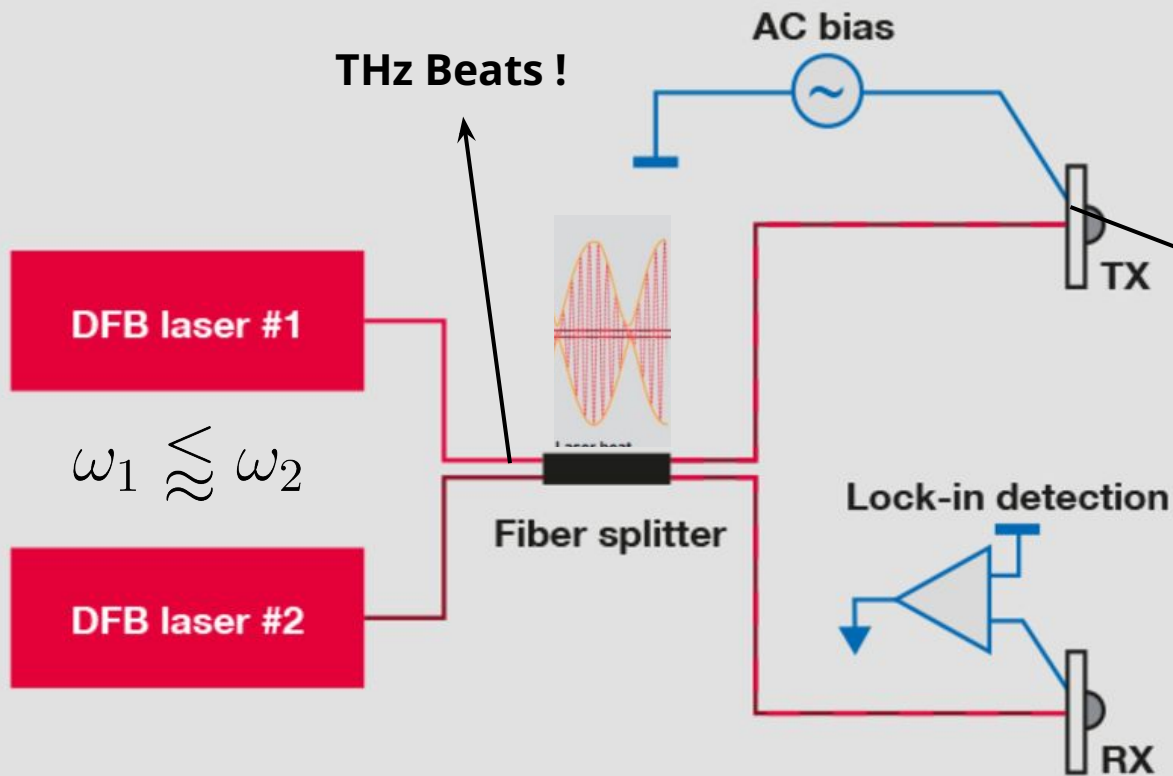

# Toptica TeraScan 1550

Lasers

# Toptica TeraScan 1550

Photodiode  
(InGaAs / GaAs)

THz emission  
(not the only way)

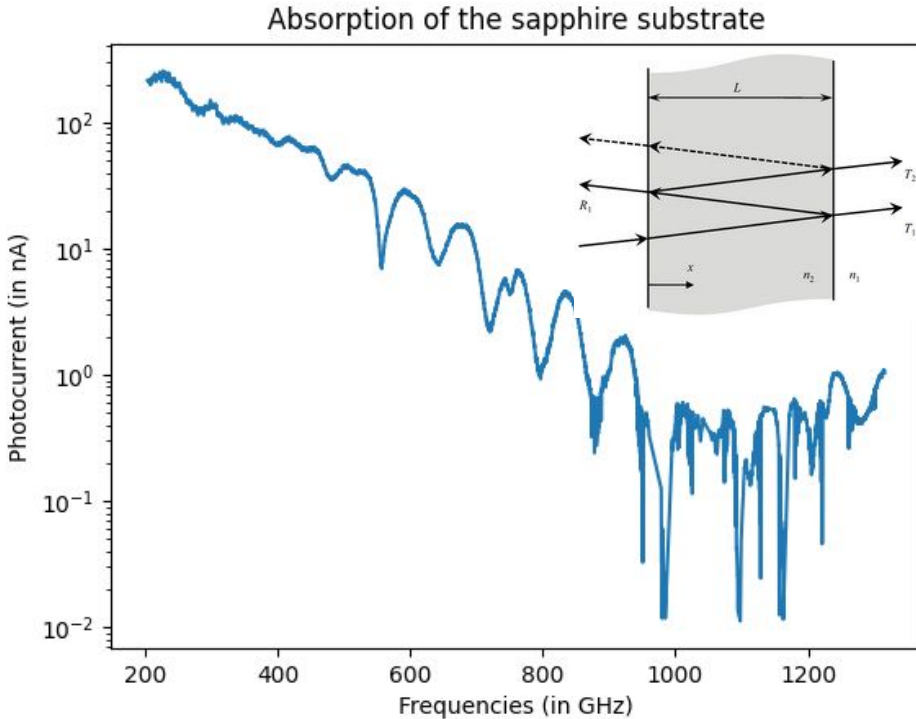

# Testing

Sample goes  
**here**

receiver

# What can we measure with this setup ?

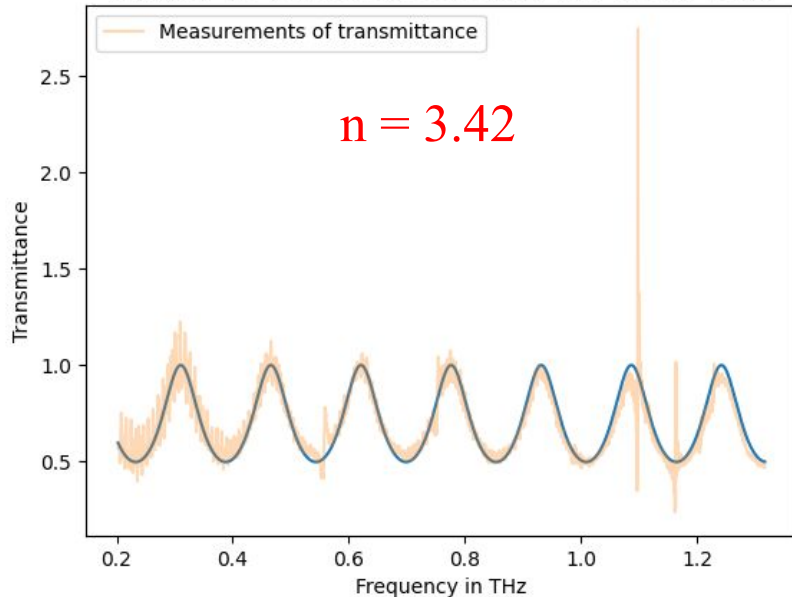

Measuring specific peak of absorption for different samples.

**Visible :**  
Fabry-Perot interferences  
+  
absorption of substrate

# Fitting of the Airy distribution function

$$A'_{\text{trans}} = \frac{I_{\text{trans}}}{I_{\text{inc}}} = (1 - R_1)(1 - R_2)A_{\text{circ}} = \frac{(1 - R_1)(1 - R_2)}{(1 - \sqrt{R_1 R_2})^2 + 4\sqrt{R_1 R_2} \sin^2(\phi)}.$$

Fitting of the transmittance of Si ( $R_1=R_2=0.15$ ;  $n=3.42$ )

Fitting of the transmittance of Sapphire substrate ( $R_1=R_2=0.11$ ;  $n=3.06$ )

# Values found within the literature

Table I. Refractive index and intensity absorption coefficients of studied materials.

Material	n	$\alpha$ (cm <sup>-1</sup> )	Comments
Silica	$1.98 \pm 0.02$	$4.2 \pm 0.4$	Eq. (3)
Silicon	$3.56 \pm 0.14$	$88 \pm 7$	High conductivity
Sapphire	$3.31 \pm 0.25$	$18 \pm 4$	Commercial quality

Federico Sanjuan et al. 2012

# Testing - NiO

emitter

receiver

**Figure** : NiO sample by Christophe Lefevre (IPCMS).

# Measuring AF resonance: NiO

NiO ?

**Figure** : NiO sample by Christophe Lefevre (IPCMS).

# Measuring AF resonance: NiO

**Figure** : NiO sample by Christophe Lefevre (IPCMS).

NiO ?

# Measuring AF resonance: NiO

**Figure** : NiO sample by Christophe Lefevre (IPCMS).

~~NiO?~~

Air absorption !

# Measuring AF resonance: NiO

**Figure** : NiO sample by Christophe Lefevre (IPCMS).

~~NiO~~ ? Air absorption !

NiO behaviour visible at around 1000 GHz

# Measuring AF resonance: NiO

Some things to consider:

This is a **bulk** measurement

How can we improve this ?

Amplify it ?

Localize it ?

## II. Improving measures

# Antennas, how do they work ?

**Figure** : Antennas are the transition between a guided wave and a free propagating one, J. Kraus, 1988.

# Antennas for THz local amplification

**Figure** : Planar antenna over substrate, Runge et al., 2020.

**Figure** : Local amplification of EM field, Runge et al., 2020.

Antennas  $\longrightarrow$  Field amplification

# What are we doing ?

# What we are looking at

Three antenna designs

Dipole

Simple bow tie

Fancy bow tie

# Simulation and optimization

## Optimization with CST.

- Over all relevant parameters
- Two ways:
  - Using plane waves
  - Using local excitation (port)

# Visualisation of the absorption by the antennas:

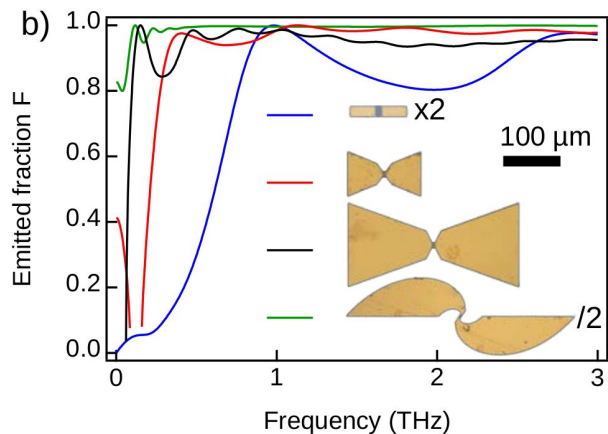

# Antennas comparison

Simulations made using a port signal

$$F = \sqrt{1 - |S|^2}$$

S : The scattering parameter

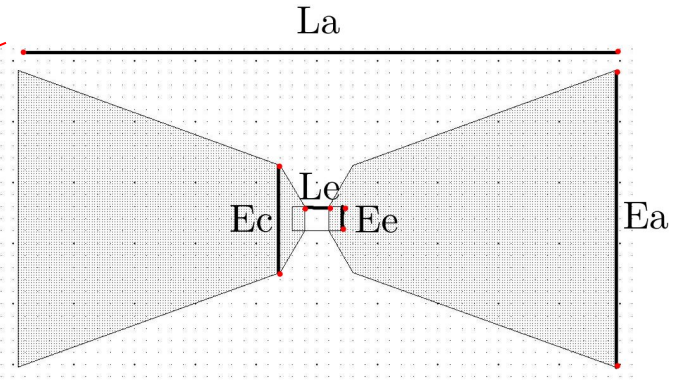

**Figure :** Antenna emission,  
(M. Pacé, et al. 2024)

Emission of the THz by the antennas

# Modeling and fabrication

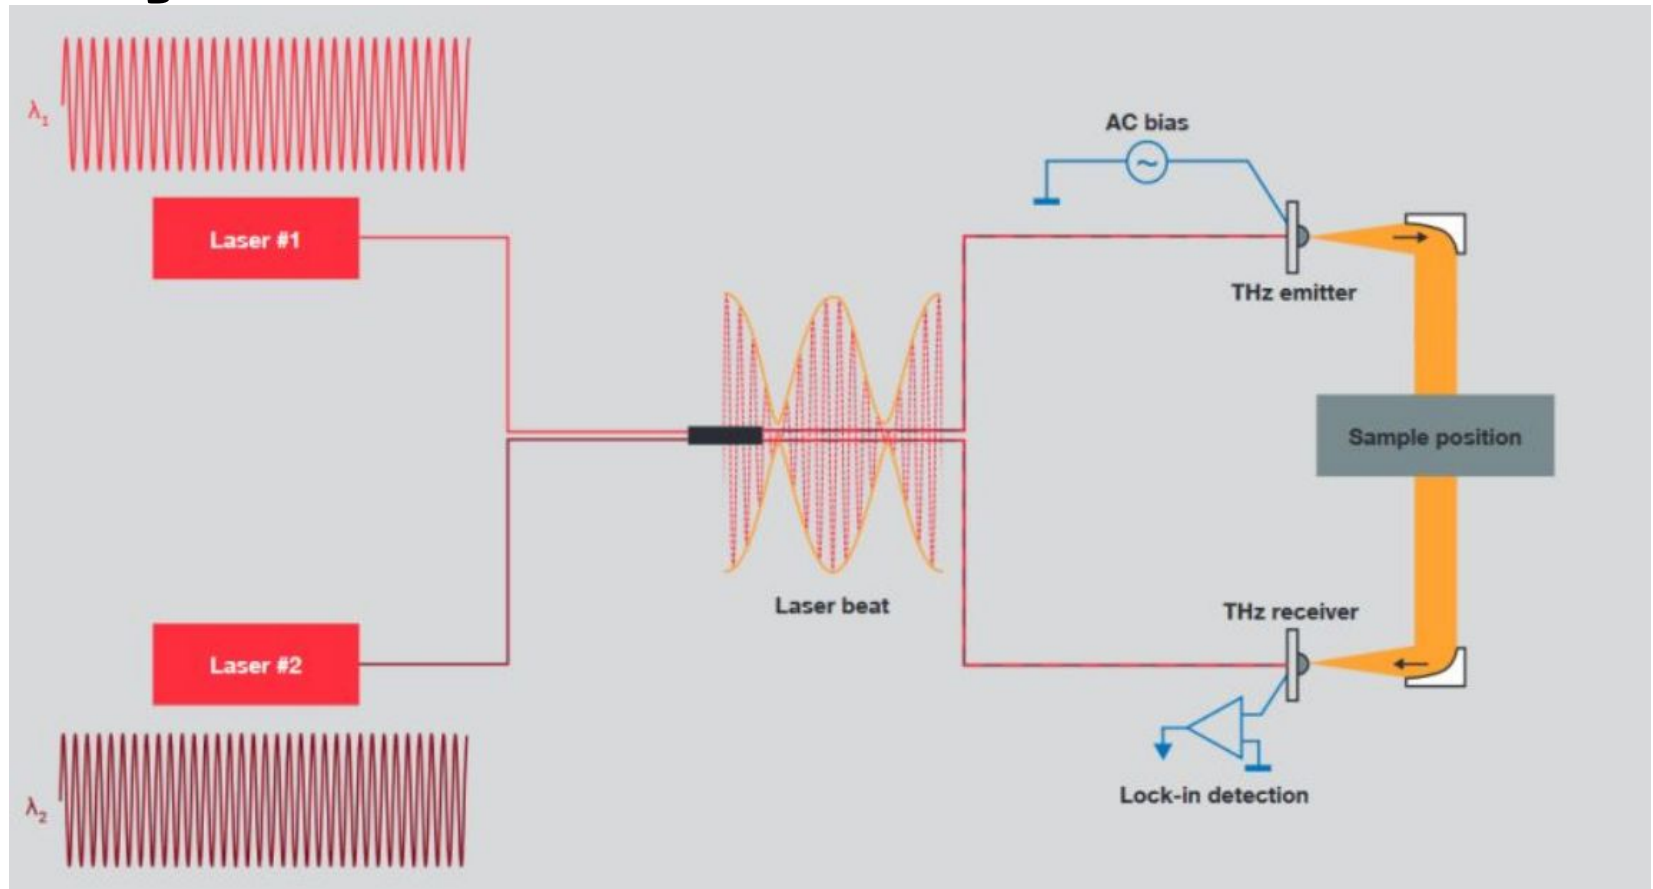

$La = 245 \mu\text{m}$   
 $Le = 10 \mu\text{m}$   
 $Ec = 45 \mu\text{m}$   
 $Ee = 10 \mu\text{m}$   
 $Ea = 123 \mu\text{m}$

# Modeling and fabrication

$L_a = 245 \mu\text{m}$   
 $L_e = 10 \mu\text{m}$   
 $E_c = 45 \mu\text{m}$   
 $E_e = 10 \mu\text{m}$   
 $E_a = 123 \mu\text{m}$

# Testing - reminder

# Spectrum

Comparing spectrum of the SiO<sub>2</sub> substrate and the antenna with air

# Spectrum

We can get the transmittance!

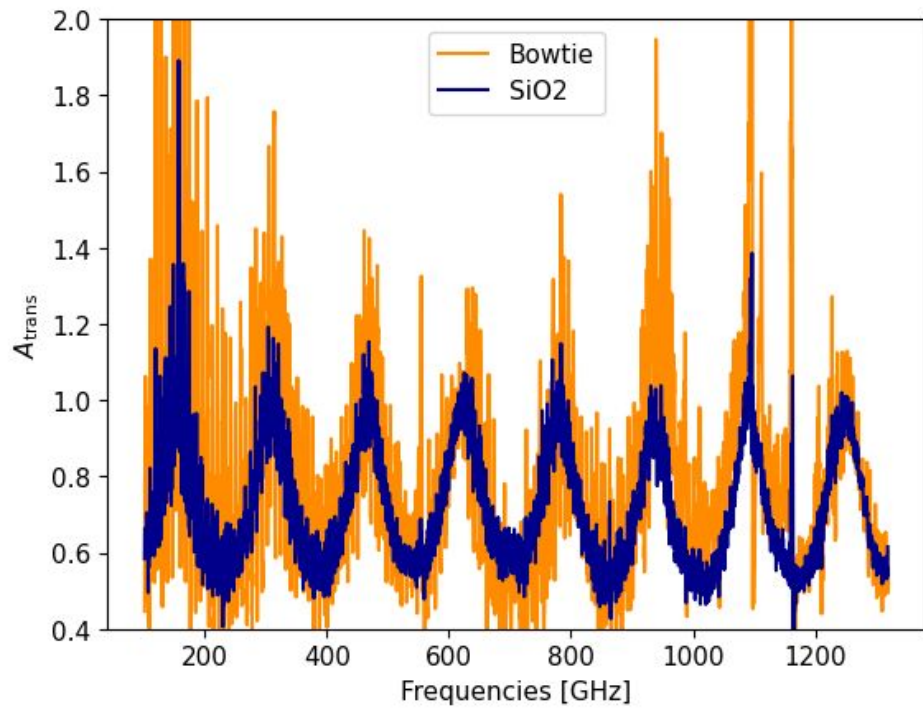

Comparing spectrum of the SiO<sub>2</sub> substrate and the antenna with air

# Transmittance

$$A'_{\text{trans}} = \frac{I_{\text{trans}}}{I_{\text{inc}}}$$

# III. Concluding remarks

# Conclusion - what did we learn ?

- Antiferromagnetic effects show great promise
  - AF resonance is at the heart of new spintronic developments
  - Antennas might be used to improve AF spintronic technology
  - We were able to perform measurements of optical index
  - Antenna effect was not noticeable due to noise
-

# Conclusion - what did we learn ?

- Antiferromagnetic effects show great promise
  - AF resonance is at the heart of new spintronic developments
  - Antennas might be used to improve AF spintronic technology
  - We were able to perform measurements of optical index
  - Antenna effect was not noticeable due to noise
- 

## Outlook

- Vacuum measurement
- Put antenna in NiO (how ?)
- Use a laser probe and other material to study local effect (appendix)
- Combine with local electric measurements

# Appendices

To answer good and bad questions

# Charge and spin current

$$\vec{J}_c = \vec{j}_\uparrow + \vec{j}_\downarrow$$

$$\vec{J}_s = \vec{j}_\uparrow - \vec{j}_\downarrow$$

# Charge and spin current

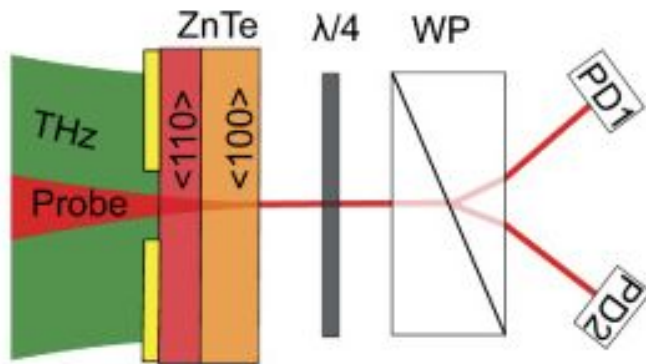

<https://arxiv.org/abs/2211.02241>

# Direct Spin Hall Effect

# Antennas for local THz detection

Runge et al., , Opt. Express (2020)

Use an antenna to amplify local field

**Improved measurements !**

Runge et al., , Opt. Express (2020)

# Antennas for THz emission

How?  $\longrightarrow$  Spin Hall effect !

1. **IR PUMP** absorbed by FM Pt
2. **Spin current**  $\rightarrow$  Electric current
3. **THz radiation**

But we are not doing this !

Thz emission using planar antennas, from *Increasing TeraHertz spintronic emission with planar antennas*, Matthias Pacé, et. al.
