# Outline of this presentation

**•** Jet definitions in DIS.

Physics opportunities with jets at the EIC (selected topics).

# <span id="page-2-0"></span>Jets in DIS

- Jets result from successive collinear/soft emissions from a virtual parton.  $\mathcal{O}(10)$  particles/jet with  $p_t > 250$  MeV in average for  $10 - 40$  GeV jets. Page, Chu, Aschenauer, 1911.00657
- Clean environment in DIS. Ex: precise  $\alpha_s$  extraction at HERA.
- In practice, one needs an IRC safe jet definition, to be used both in experimental measurements and in theory calculations.

# <span id="page-3-0"></span>Jet sequential recombination algorithms

- Popular jet definitions nowadays use sequential recombination algorithms. (Unlike cone-based jet definitions)
- Example with jets in  $e^+e^-$ : JADE,  $k_t$  algorithms,...

JADE, Z.Phys.C 33 (1986), Catani, Dokshitzer, Olsson, Turnock, Webber, PLB 269, 432 (1991)

- $\bullet$  Distance measure  $d_{ii}$  between particles i, j. Ex:  $d_{ij} = M_{ij}^2/Q^2$  for JADE def.
- Sequential clustering of particles.
	- $\rightarrow$  For each pair of particles  $(i, j)$ , work out the distance  $d_{ik}$ .
	- $\rightarrow$  Find the minimum of all  $d_{ii}$ .
	- $\rightarrow$  If the min is  $\lt d_{\rm cut}$ , recombine *i* and *j* and repeat from step 1. Otherwise, terminate the iteration.

# <span id="page-4-0"></span>Jet algorithms in hadronic collisions

- Problem: initial state soft/collinear radiations. Need to distinguish between the beam remnant and high  $p_t$  jets.
- **Idea:** introduce particle-beam distance,  $d_{iB}$ , in addition to  $d_{ii}$ .

Catani, Dokshitzer, Webber, PLB 285, 291 (1992)

 $\bullet$  Sequential recombination algorithms widely used at the LHC: "generalized- $k_t$ " algorithms.

$$
d_{ij} = \min(p_{t,i}^{2k}, p_{t,j}^{2k}) \frac{\Delta R_{ij}^2}{R^2}, \quad d_{iB} = p_{t,i}^{2k}
$$

Catani, Dokshitzer, M.H. Seymour, Webber, NPB, 406 (1993), Cacciari, Salam, Soyez, JHEP 0804:063,2008

- The distance measure is longitudinally invariant  $\Delta R_{ij}^2 = \Delta y_{ij}^2 + \Delta \phi_{ij}^2.$
- **•** Same algorithm, but it stops when  $d_{iB}$  is the minimum among all  $d_{ii}$ ,  $d_{iB}$ .

# <span id="page-5-0"></span>What about DIS?

- Jet definitions designed to ensure factorisation of inclusive jet cross sections in terms of universal pdf.
- Lorentz-invariant definition by Webber, J. Phys. G 19, 1567 (1993) similar to JADE.

$$
d_{ij} = \frac{M_{ij}^2}{Q^2 R^2}, \quad d_{iB} = 2x_{\text{Bj}} \frac{k_i \cdot P}{Q^2}
$$

 $e^+e^-$  spherically invariant jet definitions in the Breit frame.

$$
d_{ij} = \min(E_i^{2k}, E_j^{2k}) \frac{1 - \cos(\theta_{ij})}{1 - \cos(R)}, \quad d_{iB} = E_i^{2k}
$$

 $\bullet$  Many jet analysis at HERA chose longitudinally invariant  $k_t$  algorithm in the Breit frame. Ex:  $\alpha$ , determination from jet cross-sections with ZEUS, PLB 547 (2002), H1 PLB 653, 134 (2007), ...

<span id="page-6-0"></span>[Defining jets in DIS](#page-2-0) [T](#page-11-0)[M](#page-12-0)[D](#page-13-0) [a](#page-15-0)[nd](#page-16-0) small x [physics with jets](#page-11-0) [Conclusion](#page-17-0)

#### Issues with previous options

- JADE-like algorithms have undesirable features. Soft particles get recombined in the early stage, even if widely separated in angles.
- **•** Spherically invariant jet definitions in the Breit frame are not boost invariant.

 $\Rightarrow$  Hard to distinguish beam remnant from forward jets.

Longitudinally invariant jet definitions in Breit frame fail to cluster hadrons in the backward region.

Fig. from Arratia, Makris, Neill, Ringer, Sato, 2006.10751

<span id="page-7-0"></span>[Defining jets in DIS](#page-2-0) [T](#page-11-0)[M](#page-12-0)[D](#page-13-0) [a](#page-15-0)[nd](#page-16-0) small x [physics with jets](#page-11-0) [Conclusion](#page-17-0)

#### Recent developments: asymmetric jet clustering

Centauro algorithm Arratia, Makris, Neill, Ringer, Sato, 2006.10751.

$$
d_{ij} = (\Delta \bar{\eta}_{ij}^2 + 2\bar{\eta}_i \bar{\eta}_j (1 - \cos(\Delta \phi_{ij}))) / R^2, \quad d_{iB} = 1
$$

with  $\bar{\eta}_i = -\frac{2Q}{\bar{n}\cdot q} \frac{p_{\perp,i}}{n \cdot p_i}$  $\frac{p_{\perp,i}}{n\!\cdot\!p_i}$  .

Recent proposal from PC, Iancu, Mueller, Yuan 2408.03129,

$$
d_{ij}=\frac{M_{ij}^2}{z_iz_jQ^2R^2}, \quad d_{iB}=1, \quad z_i=\frac{p_i\cdot P}{P\cdot q}
$$

- **•** Boost invariant and properly cluster the forward region.
- Most importantly, they ensure TMD factorisation for SIDIS with jets in the limit  $P_1 \ll Q$ . 2408.03129

# <span id="page-8-0"></span>Single inclusive jet production in DIS

 $\Rightarrow$  Measure **jets** in DIS events and bin in terms of P<sub>⊥</sub> measured in Breit of dipole frame:

 $d\sigma^{e+A\rightarrow e'+jet+X}$ dx $_{\rm Bj}$ d $Q^2$ d $P_\perp$ 

Related studies with TMD jet functions: Gutierrez-Reyes, Scimemi, Waalewijn, Zoppi, PRL 121, 162001 (2018)

- ⇒ In the case of a hadron measurement, TMD factorisation theorem for  $Q^2 \gg P_{\perp,h}^2$ . Accesses the quark TMD, see Valerio's talk on Wednesday.
- What about jets, in particular for  $x_{\rm Bi} \ll 1$  ? [PC, Iancu, Mueller, Yuan, 2408.03129]

d

# <span id="page-9-0"></span>Jet definition and Sudakov logarithms

NLO Sudakov logs  $L = \ln(Q^2/P_{\perp}^2)$  depend on the jet definition!

For LI generalised  $k_t$  alg.,

$$
\frac{d\sigma^{\gamma_{\rm T}^* + A \to j + X}}{d^2 \mathbf{P}_{\perp}}\Big|_{\rm NLO} = \frac{d\sigma^{\gamma_{\rm T}^* + A \to j + X}}{d^2 \mathbf{P}_{\perp}}\Big|_{\rm LO} \times \frac{\alpha_s C_F}{\pi} \left[ -\frac{3}{4} L^2 + \left(\frac{3}{4} - \ln(R)\right) L + \mathcal{O}(1) \right]
$$
\nwhile for SI generalised  $k_t$  alg. ( $\beta = 2$ ) or asymmetric jet definition ( $\beta = 0$ )\n
$$
\frac{d\sigma^{\gamma_{\rm T}^* + A \to j(B) + X}}{d^2 \mathbf{P}_{\perp}}\Big|_{\rm NLO} = \frac{d\sigma^{\gamma_{\rm T}^* + A \to j + X}}{d^2 \mathbf{P}_{\perp}}\Big|_{\rm LO} \times \frac{\alpha_s C_F}{\pi} \left[ -\frac{1}{4} L^2 + \left(\frac{3(1 - \beta/2)}{4} + \ln(R)\right) L + \mathcal{O}(1) \right]
$$

• From CSS evolution of the quark TMD alone, we expect the log structure

$$
\frac{\alpha_s C_F}{\pi} \left[ -\frac{1}{4} L^2 + \frac{3}{4} L \right]
$$

 $\Rightarrow$  TMD factorisation implies  $\beta = 0$ . New LI jet definition in DIS suitable for TMD factorisation with jets.

# <span id="page-10-0"></span>Physical interpretation in the dipole frame

• Angle of the jet set by its virtuality rather by its transverse momentum. (Naively,  $\theta_{\rm jet} \sim \frac{P_{\perp}}{z q^+}$ .)

• Soft gluons contributing to Sudakov must have  $\theta_{\rm g} \gg \theta_{\rm jet}$ .  $\Rightarrow$  stronger constraint than  $\theta_{\mathcal{g}} \gg \frac{P_{\perp}}{zq^+}!$ 

**•** Jet from the antiquark is forward in the Breit frame. Must be distinguished from the beam remnant.

Aligned jet configuration in dipole frame.

# <span id="page-11-0"></span>Lepton-jet correlation: probe of quark TMD

- [Liu, Ringer, Vogelsang, Yuan, PRL 122 (2019)]
- **•** Back to the lab frame. Measure the imbalance between outgoing lepton and jet.
- **•** Probes quark TMD. No need for fragmentation function (less model dependence).
- **•** Sensitivity to cold nuclear matter transport coefficient.
- **•** Sensitivity to **Sivers effect** for polarized nucleon.

FIG. 1. The lepton-jet correlation in deep-inelastic scattering with a nucleon or nucleus at the EIC or HERA.

# <span id="page-12-0"></span>Lepton-jet correlation for saturation physics

- $\bullet$  In particular, at small x, sensitivity to sea quarks and saturation scale.
- New opportunities with large nuclei! Plot below for gold nucleus.
- Harmonic coefficient as a function of the lepton-jet transverse momentum imbalance.

[Tong, Xiao, Zhang, PRL 130 (2023)] 13/21

# <span id="page-13-0"></span>Back-to-back di-jets in DIS

- $\Rightarrow$  probe of the saturated regime of QCD
- $\Rightarrow$  access to the Weizsäcker-Williams gluon TMD in the back-to-back limit.

#### NLO results at small  $x$

[PC, Salazar, Schenke, Stebel, Venugopalan, PRL 132 (8), 081902]

$$
\langle \mathrm{d}\sigma_{\mathrm{NLO}}^{\lambda} \rangle_{x_f} = \mathcal{H}_{\mathrm{LO}}^{\lambda, ii} \int \frac{\mathrm{d}^2 \mathbf{r}_{bb'}}{(2\pi)^4} e^{-i\mathbf{q}_{\perp} \cdot \mathbf{r}_{bb'}} \hat{G}^0(x_f, \mathbf{r}_{bb'})
$$

$$
\times \left\{ 1 + \frac{\alpha_s(\mu_R)}{\pi} \left[ -\frac{N_c}{4} \ln^2 \left( \frac{\mathbf{P}_{\perp}^2 \mathbf{r}_{bb'}^2}{c_0^2} \right) - s_L \ln \left( \frac{\mathbf{P}_{\perp}^2 \mathbf{r}_{bb'}^2}{c_0^2} \right) \right. \right.
$$

$$
+ \beta_0 \ln \left( \frac{\mu_R^2 \mathbf{r}_{bb'}}{c_0^2} \right) + \mathcal{C}^{\lambda} (Q/M_{q\bar{q}}, z_1, R, x_f/x_g) \right] \bigg\}
$$

 $\bullet$   $x_f$  dependence of the gluon TMD obtained from high energy evolution with collinear improvement.

See also Taels, Altinoluk, Beuf, Marquet, JHEP 10 (2022) 184

• First line is exponentiated à la CSS to resum large double and single Sudakov logs.

• 
$$
s_L = -C_F \ln(z_1 z_2) + N_c \ln(1 + Q^2/M_{q\bar{q}}^2) - C_F \ln(R^2)
$$

⇒ agreement with [Hatta, Xiao, Yuan, Zhou, PRD 104 (2021) 5]

# <span id="page-16-0"></span>Nuclear modification factor probes non-linear evolution effects

- $\bullet$  In  $R_{\text{eA}}$  ratio, "vacuum" physics largely cancels.
- High energy resummation gives a strong suppression.
- These results depends on the initial condition: need to fit the WW TMD at small x.

# <span id="page-17-0"></span>Conclusion

- Importance of the choice of jet definitions in DIS, depending on the goal of the measurement (ex:  $\alpha_s$ , pdf or TMD extraction).
- In the case of TMD measurement with jet final states, additional studies should be performed to design optimal jet reconstruction algorithms.
- **•** Selected jet observables that will benefit from the EIC capabilities: lepton-jet and dijet correlations.
- Many things that I have not covered, in particular recent progresses in the Monte-Carlo simulation of jets in DIS, van Beekveld, Ferrario Ravasio, JHEP 02 (2024) 001, PanScales NLL accurate parton showers, etc
- o or jets in diffractive processes probing diffractive TMDs, Iancu, Mueller, Triantafyllopoulos, PRL 128 (2022), Hatta, Xiao, Yuan, PRD 106 (2022)

#### Rapidity factorization scale dependence at EIC kinematics

- $\bullet$   $x_f$  variation around a central value to gauge the sensitivity to missing N<sup>2</sup>LO corrections.
- **•** Scale variations shrink from LO to NLO.
- One expects thinner NLO bands when  $\alpha_s \ln(x_0/x_f) = O(1)$ .
