# SuperKEKB/Belle II, a flavour-factory, a rich physics program...

- We collect  $e^+e^-$  collisions at (or close to) the  $Y(4S)$  resonance, so it is:

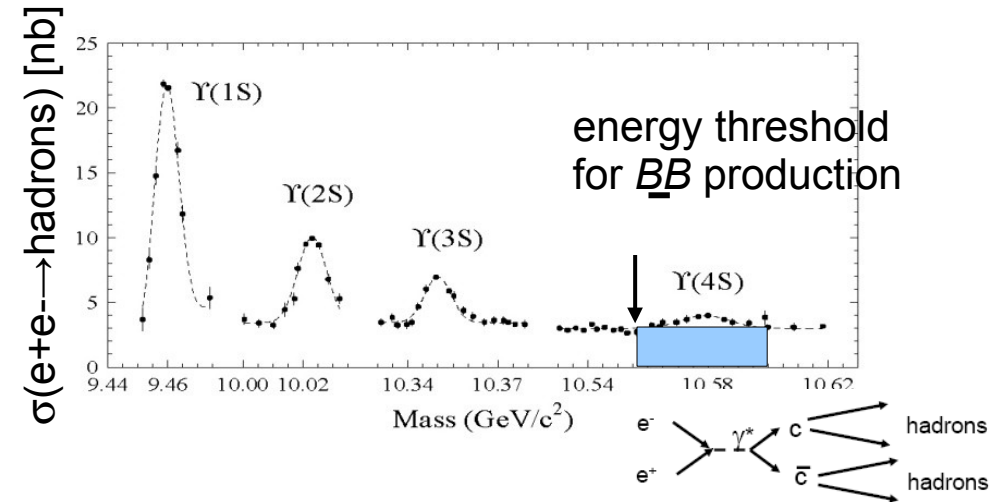

– a (Super) B-factory ( $\sim 1.1 \times 10^9$   $B\bar{B}$  pairs per  $\text{ab}^{-1}$ )

"on resonance" production

$$e^+e^- \rightarrow Y(4S) \rightarrow B_d^0 \bar{B}_d^0, B^+ B^-$$

- **2 B's and nothing else !**
- 2 B mesons are created simultaneously in a  $L=1$  coherent state

- a (Super) charm factory ( $\sim 1.3 \times 10^9$   $c\bar{c}$  pairs per  $\text{ab}^{-1}$ )  
(but also charmonium, X, Y, Z, pentaquarks, tetraquarks, bottomonium...)
- a (Super)  $\tau$  factory ( $\sim 0.9 \times 10^9$   $\tau^+\tau^-$  pairs per  $\text{ab}^{-1}$ )
- exploit the clean  $e^+e^-$  environment to probe the existence of exotic hadrons, dark photons/Higgs, light Dark Matter particles, ALPs, LLPs ...

$\Rightarrow$  to ultimately reach  $6 \times 10^{35} \text{ cm}^{-2} \text{ s}^{-1}$

# Belle II run 1 (2019-2022)

data taking from March 2019 to June 2022

→ despite difficult conditions since March 2020 (Covid, war in Ukraine, energy cost...)

**luminosity:  $4.7 \times 10^{34} / \text{cm}^2 / \text{s}$  !  $> 2 \text{ fb}^{-1}$  per day !**

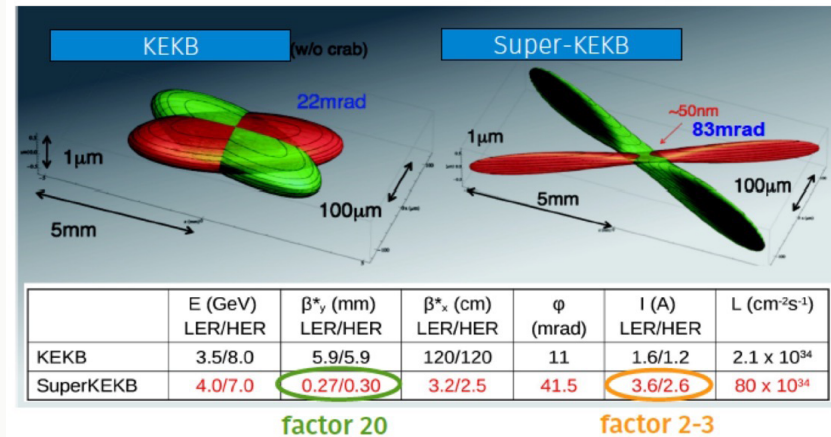

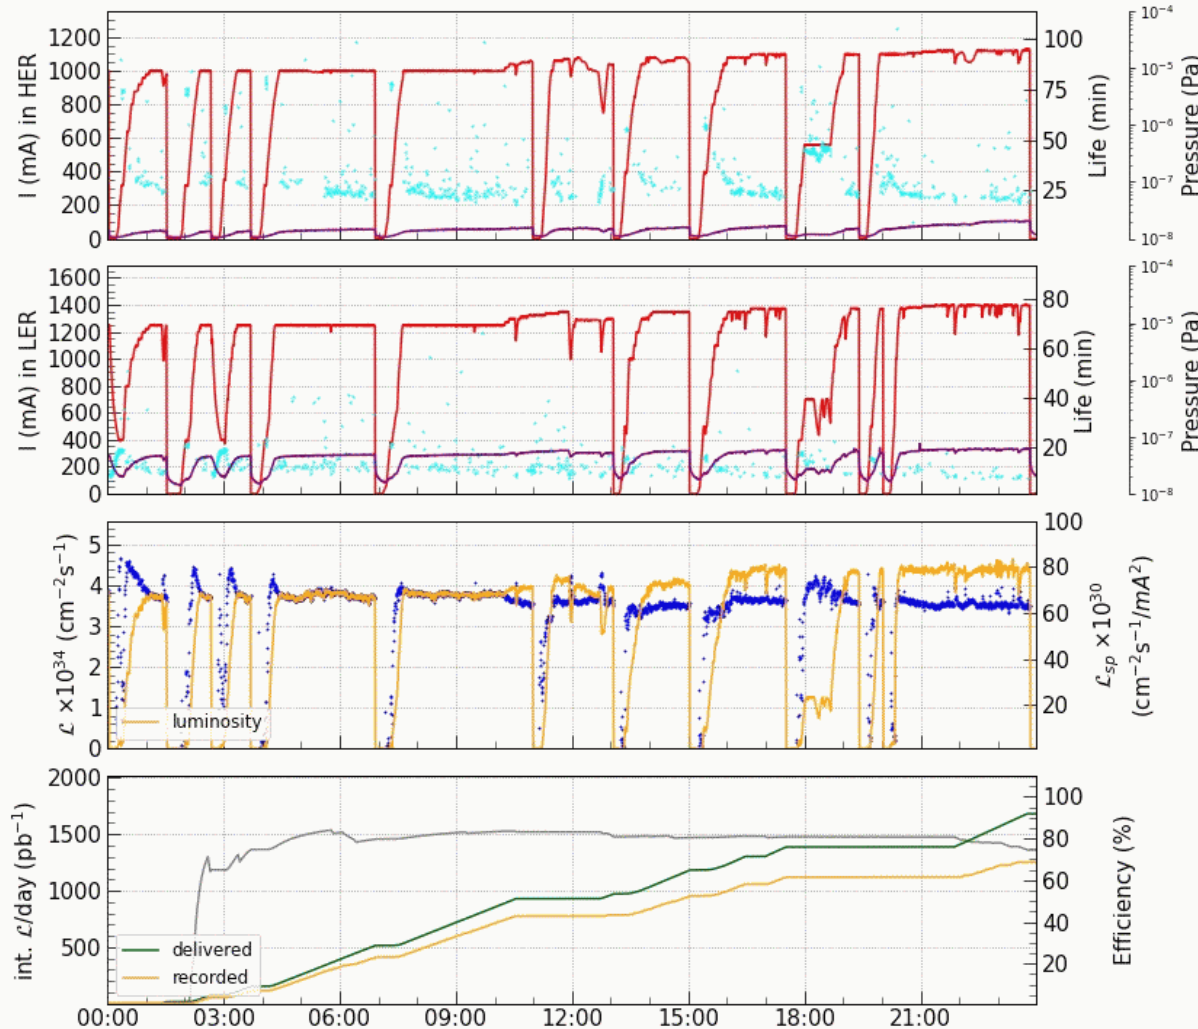

June, 2022

06/07 23:59:36 - 06/08 23:59:36, 2022 JST  
 $\mathcal{L}_{\text{peak}} 4.653 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$  @ 22:58:08 06/08  
 int.  $\mathcal{L}$ /day 1253 / 1681  $\text{pb}^{-1}$   
 HER  $I_{\text{peak}}$  1127 mA  $n_b$  2249  $\beta_x^* / \beta_y^*$  60 / 1 mm  
 LER  $I_{\text{peak}}$  1405 mA  $n_b$  2249  $\beta_x^* / \beta_y^*$  80 / 1 mm

→  $\beta_y^* = 1 \text{ mm}$ ,  $I_{\text{LER/HER}} = 1.4/1.2 \text{ A}$

**record of KEKB/Belle**  
 $2 \times 10^{34} / \text{cm}^2 / \text{s}$  currents  $> 1 \text{ A}$

**record of PEP-II/BaBar**  
 $1 \times 10^{34} / \text{cm}^2 / \text{s}$  currents  $> 2 \text{ A}$

**doubling (or more) the currents**  
 **$\Rightarrow L > 10^{35} / \text{cm}^2 / \text{s}$  after LS1**  
**then squeeze further the beams**

HER : Baking Run  
 LER : Baking Run

# Belle II run 1 (2019-2022), run 2 (2024-)

**run 1: data sample used for all results presented here**  
**and when possible/relevant add the Belle data sample (+  $1 \text{ ab}^{-1}$ )**

# Belle II detector

EM Calorimeter: CsI(Tl)  
waveform sampling

$K_L$  and muon detector  
Resistive Plate Counter (barrel)  
Scintillator + WLSF + MPPC  
(endcaps)

Vertex Detector  
4 layers DSSD  
+  
1/2 layers DEPFET

Particle Identification  
Time-Of-Propagation  
counter (barrel)  
Prox. focusing Aerogel RICH

Central Drift Chamber  
He (50%):C<sub>2</sub>H<sub>6</sub> (50%)  
small cells, long level arm,  
fast electronics

DAQ upgrade  
PCIe 40 board, capable of reading via  
high speed optical links and to write  
to computer at rate of 100 Gb/s:  
limited number of boards (20) enough  
to read entire Belle II detector

Harder *Work It*  
Better *Make It*  
Faster *Do It*  
Stronger *Makes Us*

**Main challenge: Preserve detector performance  
while luminosity (so beam background) increases**

# Belle(II), LHCb side by side

## Belle (II)

$$e^+ e^- \rightarrow Y(4S) \rightarrow b \bar{b}$$

- **2 B's and nothing else !**  
2 B mesons are created simultaneously in a L=1 coherent state
  - **clean events**
  - **high eff:**  $\gamma, \pi^0, K_S^0$
  - **B-tagging (missing energy),  $\tau$ -tagging**
  - **initial conditions are precisely known**
- $\sigma_{b\bar{b}} \sim 1 \text{ nb} \Rightarrow 1 \text{ fb}^{-1}$  produces  $10^6$   $B\bar{B}$
- $\sigma_{b\bar{b}}/\sigma_{\text{total}} \sim 1/4$

**$b\bar{b}$  production cross-section at LHCb  $\sim 500,000 \times$  BaBar/Belle !!**

higher luminosity

**B mesons live relatively long**

mean decay length  $\beta \gamma c \tau \sim 200 \mu\text{m}$

**data taking period(s)**

[1999-2010] =  $1 \text{ ab}^{-1}$

[run I: 2019-2022] =  $0.4 \text{ ab}^{-1}$

[run II: 2024-...]

## LHCb

$$pp \rightarrow b \bar{b} X$$

production of  $B^+, B^0, B_s, B_c, \Lambda_b \dots$

but also a lot of other particles in the event

$\Rightarrow$  lower reconstruction efficiencies

$\sigma_{b\bar{b}}$  much higher than at the Y(4S)

	$\sqrt{s}$ [GeV]	$\sigma_{b\bar{b}}$ [nb]	$\sigma_{b\bar{b}}/\sigma_{\text{tot}}$
HERA pA	42 GeV	$\sim 30$	$\sim 10^{-6}$
Tevatron	2 TeV	5000	$\sim 10^{-3}$
LHC	8 TeV	$\sim 3 \times 10^5$	$\sim 5 \times 10^{-3}$
	14 TeV	$\sim 6 \times 10^5$	$\sim 10^{-2}$

$\sigma_{b\bar{b}}/\sigma_{\text{total}}$  much lower than at the Y(4S)

$\Rightarrow$  lower trigger efficiencies

**mean decay length  $\beta \gamma c \tau \sim 7 \text{ mm}$**   
(displaced vertices)

[run I: 2010-2012] =  $3 \text{ fb}^{-1}$

[run II: 2015-2018] =  $6 \text{ fb}^{-1}$

[run III: 2022-...]

# Belle II collaboration – breakdown by region

125 institutes - 28 countries/regions

Belle II is an international collaboration...

...and definitely European...

# How do you we search for new physics ?

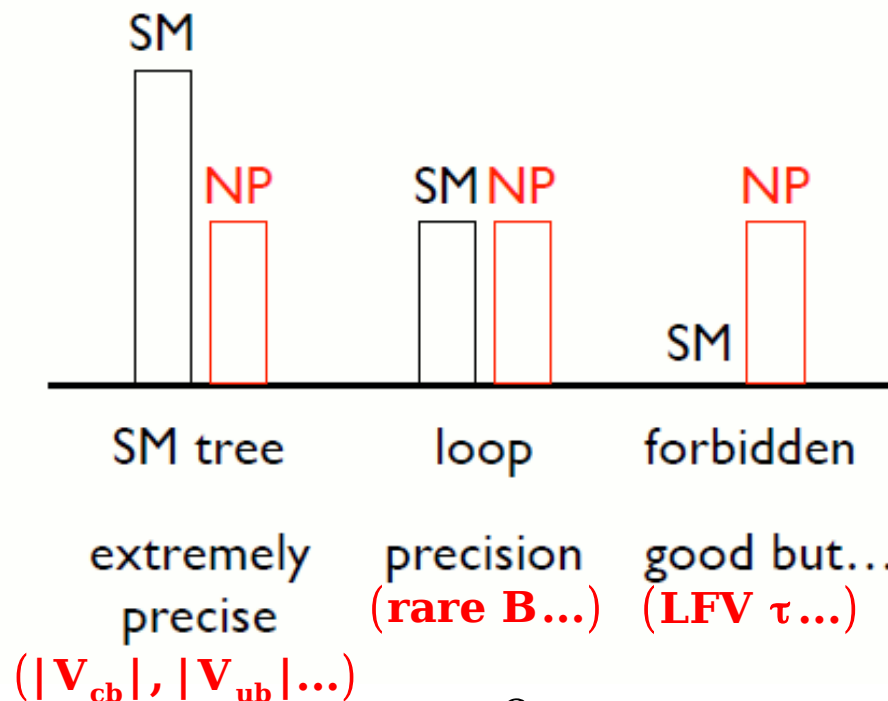

## Direct vs Indirect Searches

### Why flavor physics ?

Three classes of SM processes

$$\mathcal{O}_{\text{obs}} = \mathcal{O}_{\text{SM}} + \mathcal{O}_{\text{NP}}$$

# Missing energy modes and B-tagging

Many interesting B-physics studies involve missing energy :

$$D^{(*)}l\nu, D^{(*)}\tau\nu, K^{(*)}\tau l, K^{(*)}\tau\tau, \pi l\nu, \tau\nu, \mu\nu\dots$$

which require B-tagging :

**hadronic tag**

$$B \rightarrow D^{(*)}\pi, D^{(*)}\rho\dots$$

$$\epsilon < 1\%$$

**semileptonic tag**

$$B \rightarrow D^{(*)}l\nu X$$

$$\epsilon \sim 2\%$$

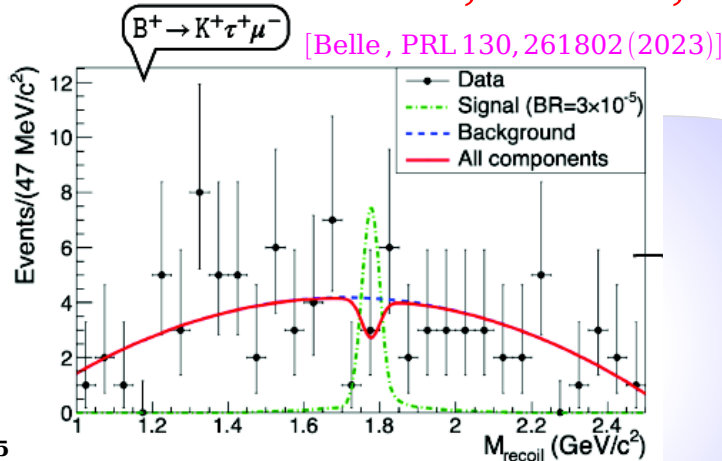

**B-tagging is a key tool for missing energy analyses**

- low efficiency (efficiency for hadronic B-tagging  $< 1\%$ )

# Missing energy modes and B-tagging

Many interesting B-physics studies involve missing energy:

$$D^{(*)}l\nu, D^{(*)}\tau\nu, K^{(*)}\tau l, K^{(*)}\tau\tau, \pi l\nu, \tau\nu, \mu\nu\dots$$

**hadronic tag**

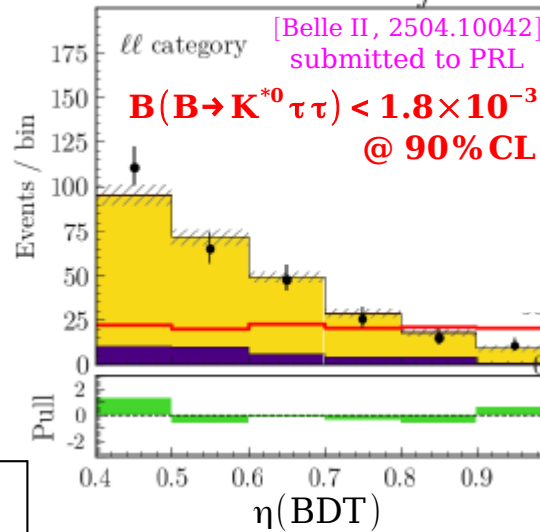

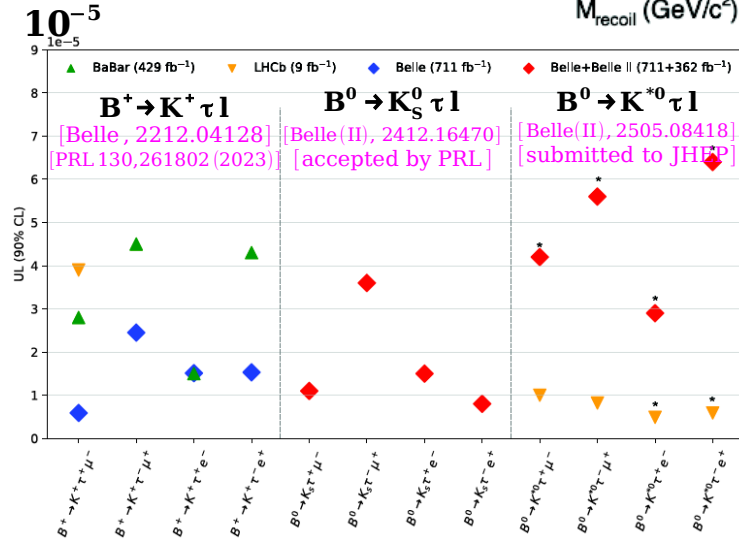

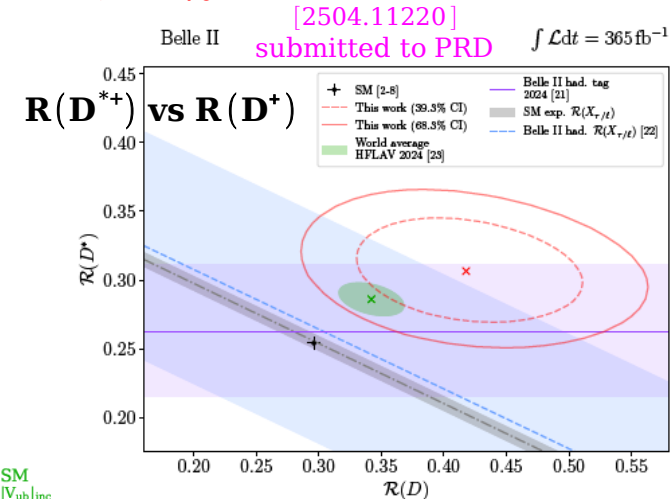

$$B \rightarrow D^{(*)}\pi, D^{(*)}\rho\dots$$

$$\epsilon < 1\%$$

**semileptonic tag**

$$B \rightarrow D^{(*)}l\nu X$$

$$\epsilon \sim 2\%$$

[Belle II, 2401.02840] PRD 110, 072020 (2024)

$$R(D^*) = 0.262^{+0.041}_{-0.039}(\text{stat})^{+0.035}_{-0.032}(\text{syst})$$

# $|V_{ub}|$ from inclusive $B \rightarrow X_u \ell \nu$ decays (had tag)

[PRELIMINARY]

- First Belle II measurement
- Hadronic B-tagging
- 3 main kinematical variables
  - $E_l^{(B)}$ : lepton energy (in  $B_{\text{sig}}$  rest-frame)
  - $M_X$ : mass of hadronic system
  - $q^2$ : momentum transfer

Extract  $|V_{ub}|$  from partial BR using the predicted partial decay rate over a given phase-space region

$$|V_{ub}| = \sqrt{\frac{\Delta \mathcal{B}(B \rightarrow X_u \ell \nu)}{\tau_B \Delta \Gamma(B \rightarrow X_u \ell \nu)}}$$

$$|V_{ub}|_{\text{GGOU}} = (4.01 \pm 0.11(\text{stat}) \pm 0.16(\text{syst}) {}^{+0.09}_{-0.07}(\text{theo})) \times 10^{-3}$$

$$|V_{ub}|_{\text{incl}}^{\text{HFLAV}} = (4.06 \pm 0.16) \times 10^{-3}$$

11

"Measurements of semileptonic and leptonic B decay at Belle and Belle II" (G.Gaudino)

# $|V_{cb}|$ from $B \rightarrow D l \nu$

[arXiv:2506.15256]

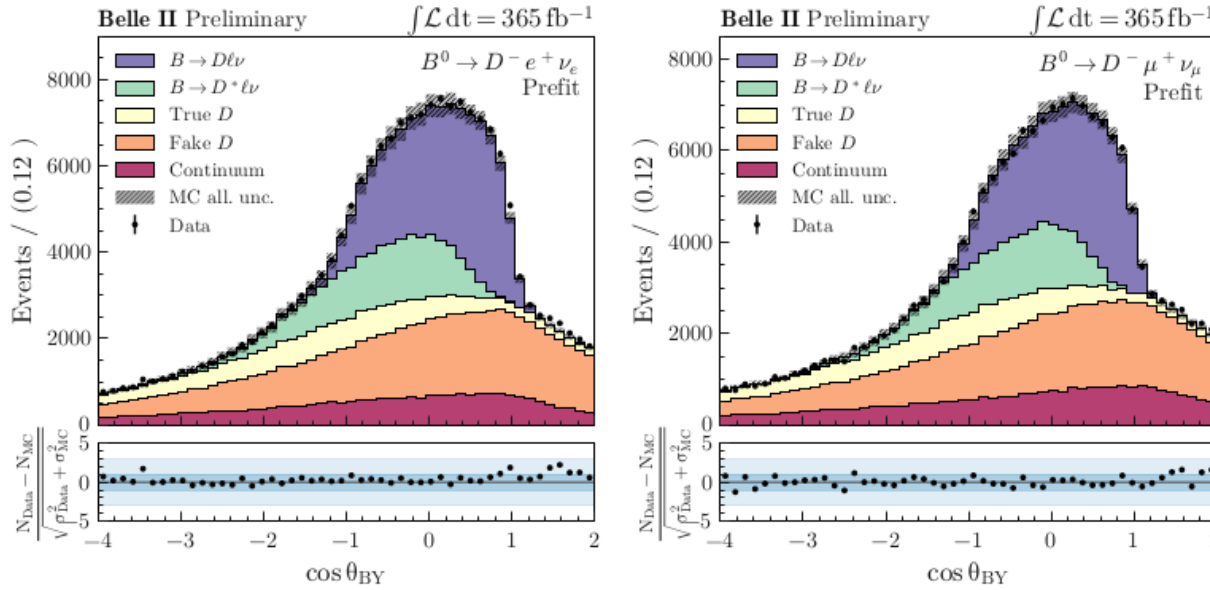

- $B^0 \rightarrow D^- l^+ \nu$  and  $B^+ \rightarrow \bar{D}^0 l^+ \nu$ , with  $l$  (e,  $\mu$ ) and  $D \rightarrow K \pi$  ( $\pi$ )
- smaller BF than  $D^* l \nu$ , significant background
- described by single form factor  $f_+(q^2)$ , no soft pion rec.
- inclusive tag side

$$\cos \theta_{BY} = \frac{2 E_{\text{Beam}} E_Y - m_B^2 - m_Y^2}{2 |\vec{p}_B| |\vec{p}_Y|}$$

Simultaneous maximum likelihood fit to 10 bins ( $w$ ) of  $\cos \theta_{BY}$

$$w = \frac{m_B^2 + m_D^2 - q^2}{2 m_B m_D}$$

## $|V_{cb}|$ extraction:

Fit differential decay rates using Bourrely-Caprini-Lellouch (BCL) parameterization of form factor

$$|V_{cb}|_{\text{BCL}} = (39.2 \pm 0.4(\text{stat}) \pm 0.6(\text{syst}) \pm 0.5(\text{theo})) \times 10^{-3}$$

**Most precise measurement to date using  $B \rightarrow D l \nu$  decays (2.3 % precision, even more precise than our  $|V_{cb}|$  with  $D^* l \nu$ )**

# Rare/Forbidden B decays

→ NP beyond the direct reach of the LHC

New particles can for example contribute to loop or tree level diagrams  
**by enhancing/suppressing decay rates, introducing new sources of CP violation or modifying the angular distribution of the final-state particles**

$$\underline{\mathbf{B \rightarrow K \nu \bar{\nu}}}$$

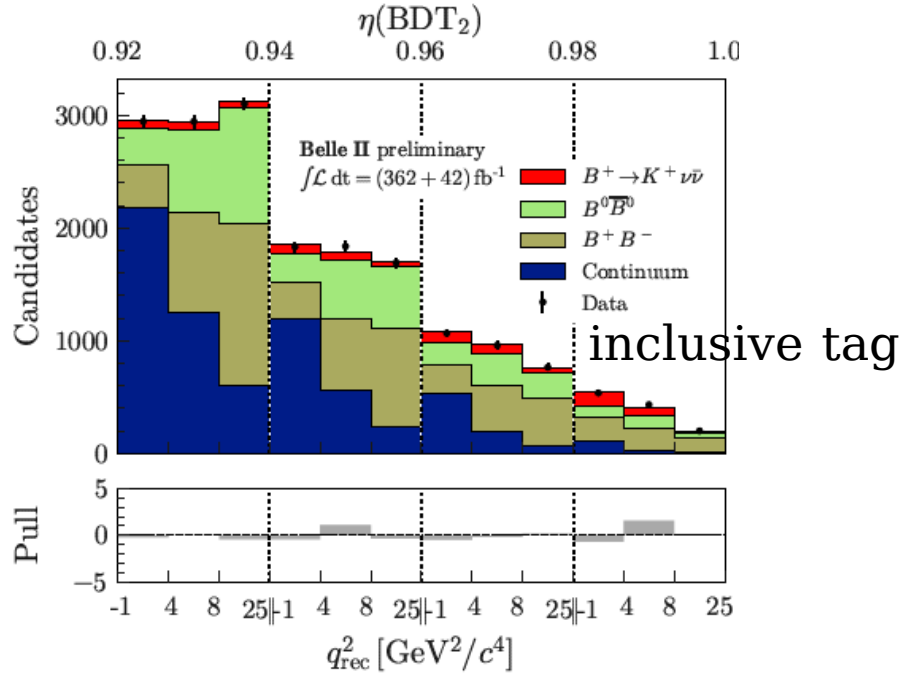

- $B \rightarrow K \nu \nu$  is known with high accuracy  
 $B(B \rightarrow K \nu \nu) = (5.6 \pm 0.4) \times 10^{-6}$  [arXiv:2207.13371]
- Extensions beyond SM may lead to significant rate increase
- Very challenging experimentally, not yet observed
  - Low branching fraction, high background contributions
  - 3-body kinematics  $\Rightarrow$  no peaking variables to isolate signal
- Unique for Belle II

# Evidence of $B \rightarrow K \nu \bar{\nu}$

[arXiv:2311.14647]  
PRD109, 112006 (2024)

- Two analyses: more sensitive **inclusive** (eff = 8%), conventional **hadronic** tagging (eff = 0.4%)
- Use event properties to suppress background with multiple variables combined
- Use classifier output as (one of) the fit variables, use simulation for signal and background templates
- Use multiple control channels to validate simulation with data

- Max. likelihood fit to data using signal and bckg templates

$$\mathbf{B}_{\text{incl}} = (2.7 \pm 0.5 (\text{stat}) \pm 0.5 (\text{syst})) \times 10^{-5}$$

$$\mathbf{B}_{\text{had}} = (1.1^{+0.9}_{-0.8} (\text{stat})^{+0.8}_{-0.5} (\text{syst})) \times 10^{-5}$$

- For inclusive analysis, evidence for  $B \rightarrow K \nu \bar{\nu}$  at  $3.5\sigma$  branching fraction within  $3\sigma$  of SM
- For hadronic tag, the result is consistent with null hypothesis and SM at  $1.1\sigma$  and  $0.6\sigma$

⇒ Combination of two analyses provides first evidence of the decay at  $2.7\sigma$  from SM

# Search for $B \rightarrow X_s \nu \bar{\nu}$ decays [PRELIMINARY]

- $B_{SM} = (2.9 \pm 0.3) \times 10^{-5}$  [JHEP02 (2015) 184]
- $B < 6.4 \times 10^{-4}$  at 90% C.L. [ALEPH, EPJC 19 (2001) 213]
- using Belle II sample of  $362 \text{ fb}^{-1}$
- Hadronic B-tagging
- Sum-of-exclusive from 30 decay modes ( $\sim 90\%$  of inclusive)

	$B^0 \bar{B}^0$				$B^\pm$		
$K$	$K_S^0$				$K^\pm$		
$K\pi$	$K^\pm \pi^\mp$	$K_S^0 \pi^0$			$K^\pm \pi^0$	$K_S^0 \pi^\pm$	
$K2\pi$	$K^\pm \pi^\mp \pi^0$	$K_S^0 \pi^\pm \pi^\mp$	$K_S^0 \pi^0 \pi^0$		$K^\pm \pi^\mp \pi^\pm$	$K_S^0 \pi^\pm \pi^0$	$K^\pm \pi^0 \pi^0$
$K3\pi$	$K^\pm \pi^\mp \pi^\pm \pi^\mp$	$K_S^0 \pi^\pm \pi^\mp \pi^0$	$K^\pm \pi^\mp \pi^0 \pi^0$		$K^\pm \pi^\mp \pi^\pm \pi^0$	$K_S^0 \pi^\pm \pi^\mp \pi^\pm$	$K_S^0 \pi^\pm \pi^0 \pi^0$
$K4\pi$	$K^\pm \pi^\mp \pi^\pm \pi^\mp \pi^0$	$K_S^0 \pi^\pm \pi^\mp \pi^\pm \pi^\mp$	$K_S^0 \pi^\pm \pi^\mp \pi^0 \pi^0$		$K^\pm \pi^\mp \pi^\pm \pi^\mp \pi^\pm$	$K_S^0 \pi^\pm \pi^\mp \pi^\pm \pi^0$	$K^\pm \pi^\mp \pi^\pm \pi^0 \pi^0$
$3K$	$K^\pm K^\mp K_S^0$				$K^\pm K^\mp K^\pm$		
$3K\pi$	$K^\pm K^\mp K^\pm \pi^\mp$	$K^\pm K^\mp K_S^0 \pi^0$			$K^\pm K^\mp K^\pm \pi^0$	$K_S^0 K^\pm K^\mp \pi^\pm$	

- For background suppression, use BDT (include sum of remaining energy in ECL)
- signal extraction in  $(\text{BDT output}) \times M_{X_s}$  plane

$$B(B \rightarrow X_s \nu \bar{\nu}) < \begin{cases} 2.5 \times 10^{-5} & (0.0 < M_{X_s} < 0.6 \text{ GeV}/c^2) \\ 1.0 \times 10^{-4} & (0.6 < M_{X_s} < 1.0 \text{ GeV}/c^2) \\ 3.5 \times 10^{-4} & (1.0 < M_{X_s}) \end{cases}$$

**$B(B \rightarrow X_s \nu \bar{\nu}) < 3.6 \times 10^{-4}$  at 90% C.L.**

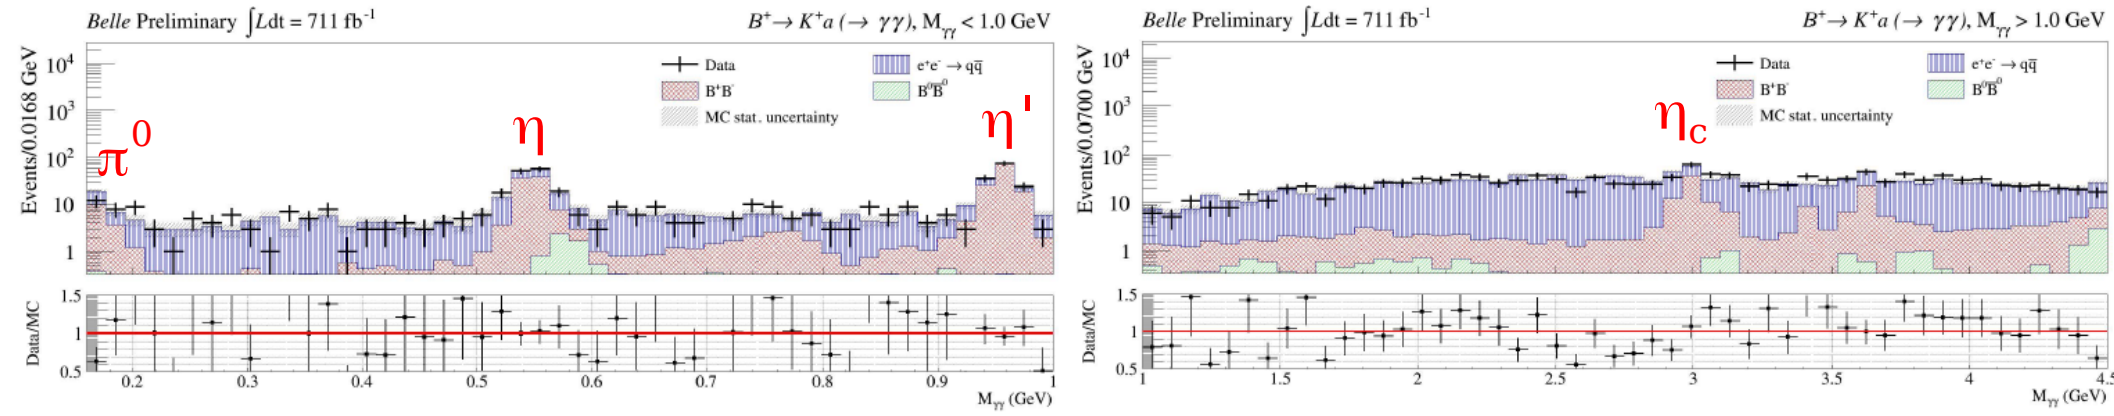

**$\Rightarrow$  The most stringent upper limit on  $B \rightarrow X_s \nu \bar{\nu}$  decay**

"Measurements of electroweak penguin and LFV B decays with missing energy at Belle and Belle II"  
(V. Bertacchi)

# Search for $B \rightarrow K^{(*)} a (\rightarrow \gamma \gamma)$ [arXiv:2507.01249 submitted to JHEP]

- Search for an ALP in the MeV-GeV scale
- Previous result on  $B^+ \rightarrow K^+ a$  [BaBar, PRL 128, 131802 (2022)]
- using Belle sample ( $711 \text{ fb}^{-1}$ )
- four kaon modes included:  $K_S^0$ ,  $K^+$ ,  $K^{*+}$ ,  $K^{*0}$
- $B(a \rightarrow \gamma \gamma) \sim 100\%$  when  $m_a \ll m_{W^+}$
- $m_a$  investigated from  $160 \text{ MeV}/c^2$  to the kinematic end - point

- Main background is continuum ( $e^+ e^- \rightarrow q \bar{q}$ ) rejected with BDTs based on kinematics and topology variables
- fit di -photon invariant mass to extract signal yield
- Peaking background regions vetoes ( $\pi^0$ ,  $\eta$ ,  $\eta'$ )
- $B \rightarrow K \eta, K \eta'$  as validation modes

For each ALP mass hypothesis, simultaneous fit performed on four kaon modes to obtain the coupling constant  $g_{aW}$

**$\Rightarrow$  improved at least by factor 2 from BaBar**

"Searches for dark sector particles at Belle II"  
(L. Salutari)

# CPV in isospin-related $D^{0,+} \rightarrow \pi^{0,+} \pi^0$ modes

Sum-rule for CPV in  $D \rightarrow \pi \pi$ , to determine the source of CPV:

$$R = \frac{A_{CP}^{\text{dir}}(D^0 \rightarrow \pi^+ \pi^-)}{1 + \frac{\tau_{D^0}}{\mathcal{B}_{+-}} \left( \frac{\mathcal{B}_{00}}{\tau_{D^0}} - \frac{2}{3} \frac{\mathcal{B}_{+0}}{\tau_{D^+}} \right)} + \frac{A_{CP}^{\text{dir}}(D^0 \rightarrow \pi^0 \pi^0)}{1 + \frac{\tau_{D^0}}{\mathcal{B}_{00}} \left( \frac{\mathcal{B}_{+-}}{\tau_{D^0}} - \frac{2}{3} \frac{\mathcal{B}_{+0}}{\tau_{D^+}} \right)} + \frac{A_{CP}^{\text{dir}}(D^+ \rightarrow \pi^+ \pi^0)}{1 - \frac{3}{2} \frac{\tau_{D^+}}{\mathcal{B}_{+0}} \left( \frac{\mathcal{B}_{00}}{\tau_{D^0}} + \frac{\mathcal{B}_{+-}}{\tau_{D^0}} \right)}$$

if  $R \neq 0$ , CPV from  $\Delta I = 1/2$  amplitude; if  $R=0$  and at least one  $A_{CP}^{\text{dir}} \neq 0$ , CPV from beyond SM  $\Delta I = 3/2$  amplitude

Raw asymmetry of  $D^0 \rightarrow \pi^0 \pi^0$  using tagged events ( $D^{*+}$ ) [arXiv:2505.02912]

$$A^{\pi^0 \pi^0} = A_{CP}(D^0 \rightarrow \pi^0 \pi^0) + A_P^{D^{*+}} + A_\epsilon^{\pi_s}$$

$A_P^{D^{*+}}$ : forward-backward asymmetric production of  $D^{*+}$  in  $e^+ e^- \rightarrow c \bar{c}$  events

$A_\epsilon^{\pi_s}$ : charge asymmetry in detection efficiency

$$A_{CP}(D^0 \rightarrow \pi^0 \pi^0) = A_{\text{avg}}^{\pi^0 \pi^0} - A_{\text{avg}}^{K\pi} + A_{\text{avg}}^{K\pi, \text{untag}}$$

$$A_{\text{avg}}^f = (A^f(\cos \theta^* < 0) + A^f(\cos \theta^* > 0))/2$$

Belle II with  $428 \text{ fb}^{-1}$ :

$$A_{CP}(D \rightarrow \pi^0 \pi^0) = (+0.30 \pm 0.72 \pm 0.20) \%$$

(Belle with  $980 \text{ fb}^{-1}$ :  $(-0.03 \pm 0.64 \pm 0.10) \%$ )

[PRL 112 (2014) 211601]

$$\Rightarrow R = (1.5 \pm 2.5) \times 10^{-3}$$

improve by  $\sim 20 \%$  w.r.t current HFLAV result

$\cos \theta^*(D^{*+}) > 0$

$N_{\text{sig}} = 14100 \pm 130$

$\cos \theta^*(D^{*+}) < 0$

$N_{\text{sig}} = 11550 \pm 110$

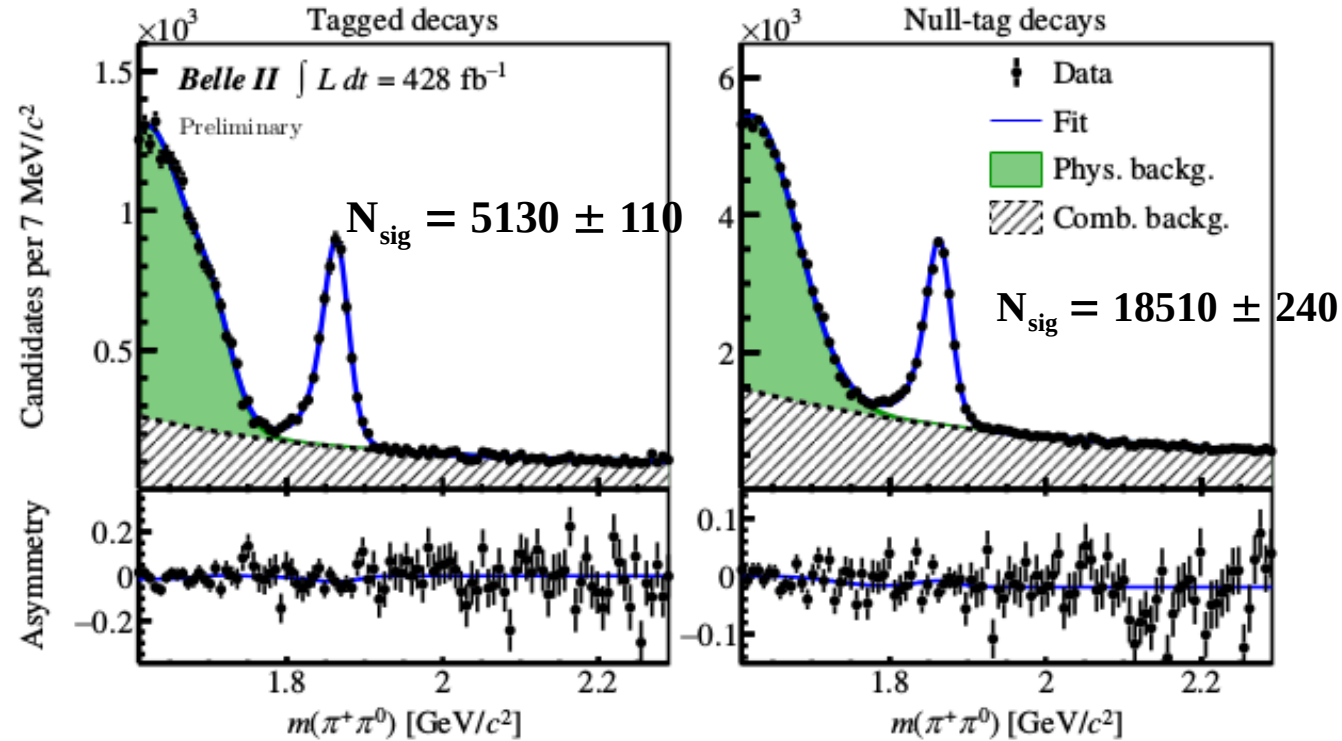

# $A_{CP}(D^+ \rightarrow \pi^+ \pi^0)$ at Belle and Belle II [\[arXiv:2506.07879\]](https://arxiv.org/abs/2506.07879)

Split sample as tagged (from  $D^{*+} \rightarrow D^+ \pi^0$ ) and not

Using  $D^+ \rightarrow K_S^0 \pi^+$  to eliminate common asymmetry sources:

$$A_{\text{prod}}^D \text{ and } A_{\epsilon}^{\pi^+}$$

$$A_{CP}^{\pi^+ \pi^0} = A_{\text{raw}}^{\pi^+ \pi^0} - A_{\text{raw}}^{K_S^0 \pi^+} + A^{\bar{K}^0}$$

$$A_{CP}^{\text{tag}} = (-3.9 \pm 1.8 \pm 0.2)\% \quad A_{CP}^{\text{null}} = (-1.1 \pm 1.0 \pm 0.1)\%$$

Belle II combining  $A_{CP}^{\text{tag}}$  and  $A_{CP}^{\text{null}}$  with  $428 \text{ fb}^{-1}$ :

$$A_{CP}(D \rightarrow \pi^+ \pi^0) = (-1.8 \pm 0.9 \pm 0.1)\%$$

(Belle with  $980 \text{ fb}^{-1}$ :  $(+2.31 \pm 1.24 \pm 0.23)\%$ ) [\[PRD 97 \(2018\) 011101\]](https://arxiv.org/abs/1801.05208)

**improved by  $\sim 30\%$** , better purity achieved through an improved event selection thanks to Belle II's superior performance in reconstruction of neutral pions and displaced charged particles

# $A_{CP}(D^0 \rightarrow K_S^0 K_S^0)$ measurement using $D^{*+}$ -tagged sample

[arXiv:2411.00306 - PRD 111 (2025) 012015]

CPV in  $D \rightarrow K_S^0 K_S^0$  enhanced to an observable level due to interference btw  $c \rightarrow u s \bar{s}$  and  $c \rightarrow u d \bar{d}$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = \frac{\Gamma(D^0 \rightarrow K_S^0 K_S^0) - \Gamma(\bar{D}^0 \rightarrow K_S^0 K_S^0)}{\Gamma(D^0 \rightarrow K_S^0 K_S^0) + \Gamma(\bar{D}^0 \rightarrow K_S^0 K_S^0)}$$

Belle ( $921 \text{ fb}^{-1}$ ):  $(0.0 \pm 1.5 \pm 0.2)\%$

[PRL 119, 171801 (2017)]

LHCb ( $6 \text{ fb}^{-1}$ ):  $(-3.1 \pm 1.2 \pm 0.4 \pm 0.2)\%$

[PRD 104, L031102 (2021)]

Unbinned fit to  $(m(D^0 \pi_s), S_{\min})$  of  $D^0$  and  $\bar{D}^0$  candidates for  $D^0 \rightarrow K_S^0 K_S^0$

flight significance variable  $S_{\min} = \log(\min(L_i/\sigma_i))$ : separate peaking background  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$

$$A_{CP}^{K_S^0 K_S^0} = (A_{\text{raw}}^{K_S^0 K_S^0} - A_{\text{raw}}^{K^+ K^-}) + A_{CP}^{K^+ K^-}$$

$$A_{\text{raw}}^{K\bar{K}} = \frac{N(D^0) - N(\bar{D}^0)}{N(D^0) + N(\bar{D}^0)} = A_{\text{FB}}^{D^{*+}} + A_{CP}^{K\bar{K}} + A_{\varepsilon}^{\pi_s}$$

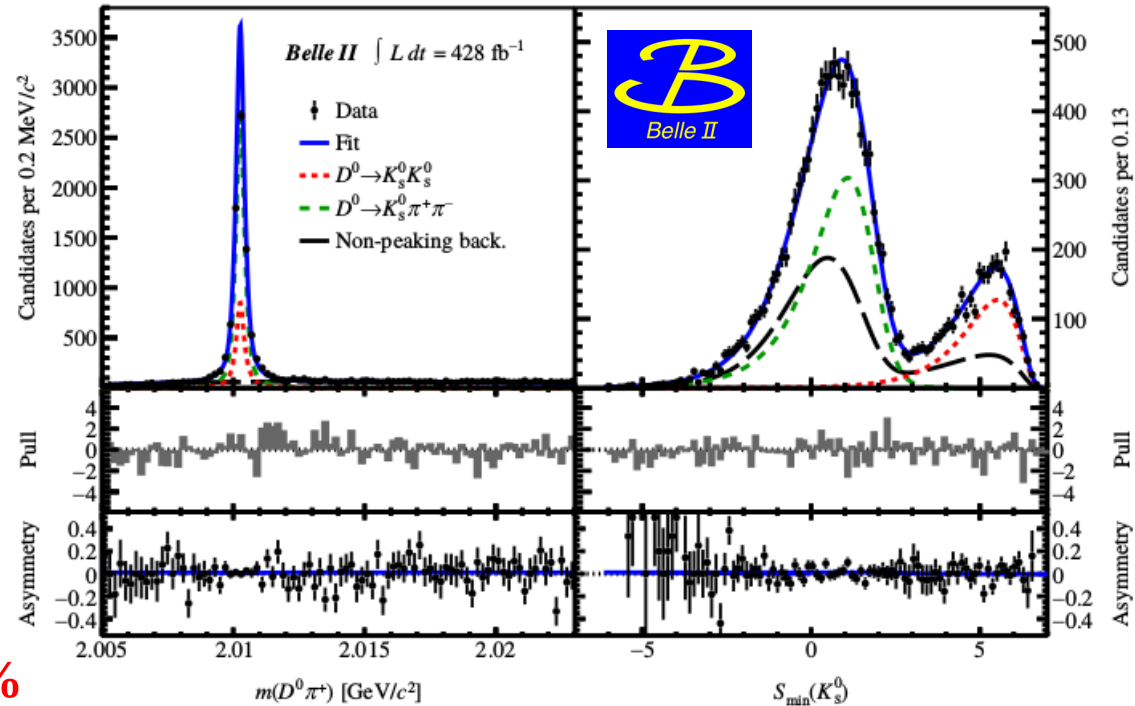

Control mode  $D^0 \rightarrow K^+ K^-$ :

$$A_{CP}^{K^+ K^-} = A_{CP}^{\text{dir}} + \Delta Y = (6.7 \pm 5.4) \times 10^{-4}$$

Belle ( $980 \text{ fb}^{-1}$ ):  $(-1.1 \pm 1.6 \pm 0.1)\%$

Belle II ( $428 \text{ fb}^{-1}$ ):  $(-2.2 \pm 2.3 \pm 0.1)\%$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-1.4 \pm 1.3 \pm 0.1)\%$$

# $A_{CP}(D^0 \rightarrow K_S^0 K_S^0)$ measurement using opposite - side flavor tagging

[arXiv:2504.15881]  
accepted PRD

Candidates reconstructed in  $D^{*+}$  - tagged analysis are removed:

Belle ( $980 \text{ fb}^{-1}$ ):  $(+2.5 \pm 2.7 \pm 0.4)\%$

Belle II ( $428 \text{ fb}^{-1}$ ):  $(-0.1 \pm 3.0 \pm 0.3)\%$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (+1.3 \pm 2.0 \pm 0.2)\%$$

Final result (Belle + Belle II:  $1.4 \text{ ab}^{-1}$ )  
with two flavor tagging methods:

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-0.6 \pm 1.1 \pm 0.1)\%$$

"Mixing and CPV measurements with D mesons  
at Belle and Belle II" (L. Massaccesi)

# $A_{CP}$ in $D \rightarrow \pi^+ \pi^- \pi^0$ with Belle II [PRELIMINARY]

- $D^0$  flavor tagged through  $D^{*+} \rightarrow D^0 \pi^+$
- signal extraction with 2D fit in  $M_D$  and  $\Delta M$
- Split in 8 symmetric bins of  $\cos \theta_{CM}$  to correct production asymmetry
- $D^0 \rightarrow K^- \pi^+$  as reference mode

$$A_{CP} = (0.29 \pm 0.27 \pm 0.13) \%$$

- No asymmetry
- Compatible with previous measurements [Belle, BaBar]
- 34 % improvement (stat) w.r.t world's best (BaBar)

# " $\tau$ center"

- **Belle II is also a  $\tau$ -factory!**
- **lepton flavour violating decays of the  $\tau$  as NP probe**

⇒ Lepton flavor conservation accidental symmetry of SM, many NP models can naturally break this symmetry

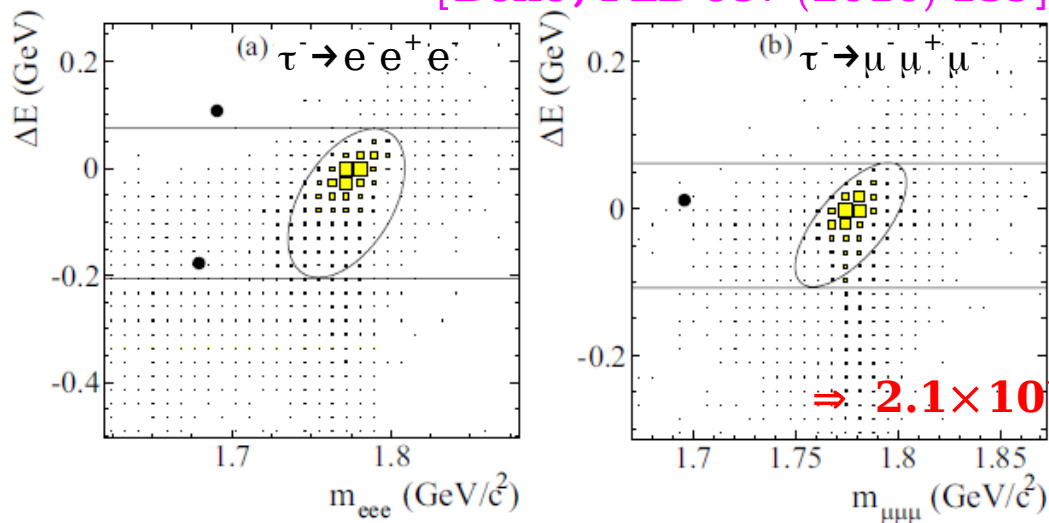

Model	Reference	$\tau \rightarrow \mu \gamma$	$\tau \rightarrow \mu \mu \mu$
SM+ $\nu$ oscillations	EPJ C8 (1999) 513	$10^{-40}$	$10^{-55}$
SM+ heavy Maj $\nu_R$	PRD 66 (2002) 034008	$10^{-9}$	$10^{-10}$
Non-universal $Z'$	PLB 547 (2002) 252	$10^{-9}$	$10^{-8}$
SUSY SO(10)	PRD 68 (2003) 033012	$10^{-8}$	$10^{-10}$
mSUGRA+seesaw	PRD 66 (2002) 115013	$10^{-7}$	$10^{-9}$
SUSY Higgs	PLB 566 (2003) 217	$10^{-10}$	$10^{-7}$

# cLFV : beyond the Standard Model

$\tau$  LFV searches at Belle II are extremely clean with very little background (if any), thanks to pair production and double-tag analysis technique.

[Belle, PLB 687 (2010) 139]

$\Rightarrow 2.1 \times 10^{-8}$  at 90% CL

how to improve further ?

...considering  $\tau \rightarrow \mu / e h^+ h^-$   
in function of one prong  
tag categories  
...for  $\tau \rightarrow 3$  muons,  
improve  $\mu$ -ID at low mom  
(ECL info)

In contrast, hadron collider experiments must contend with larger combinatorial and specific backgrounds

Background modes normalised  
to  $D_s \rightarrow \eta(\mu\mu\gamma)\mu\nu$  (BR  $\sim 10^{-5}$ )

[LHCb, JHEP02(2015)121,  $2 \text{ fb}^{-1}$ ]

$\Rightarrow 4.6 \times 10^{-8}$  at 90% CL

Decay channel	Relative abundance
$D_s \rightarrow \eta(\mu\mu\gamma)\mu\nu$	1
$D_s \rightarrow \phi(\mu\mu)\mu\nu$	0.87
$D_s \rightarrow \eta'(\mu\mu\gamma)\mu\nu$	0.13
$D \rightarrow \eta(\mu\mu\gamma)\mu\nu$	0.13
$D \rightarrow \omega(\mu\mu)\mu\nu$	0.06
$D \rightarrow \rho(\mu\mu)\mu\nu$	0.05

**CMS, full Run 2 dataset:  $2.9 \times 10^{-8}$  at 90% CL** [2312.02371]

Most improvement in coming decade is expected from Belle II, which can reach  $1 \times 10^{-9}$  [arXiv:1011.0352] and will do even better if can achieve  $\sim$  zero bckgd

# $\tau \rightarrow 3\mu$ at Belle II

Analysis selection and results: inclusive approach

BDT trained on 32 variables:  
inputs from signal  $\tau^-$ , event tag side,  
event shape and kinematics

$$\epsilon_{\text{sig}} = (20.42 \pm 0.06)\% \quad (3 \times \text{larger than Belle})$$

Expected BKG:  $0.5^{+1.4}_{-0.5}$  evts

No significant excess in  $424 \text{ fb}^{-1}$  of data

**Obtained most stringent limit**  
 **$1.9 \times 10^{-8}$**

[2405.07386, JHEP 2024 (2024) 62]

# Search for $\tau^- \rightarrow e^\pm l^\mp l^-$ at Belle II

[PRELIMINARY]

Extend previous study to 5 more modes with at least one electron in the final state:

$$\tau^- \rightarrow e^- e^+ e^-, e^- e^+ \mu^-, e^- \mu^+ e^-, \mu^- \mu^+ e^-, \mu^- e^+ \mu^-$$

- inclusive-tagging reconstruction
- BDT to suppress background
  - rely on rest of event and kinematic variables
  - trained on sideband in data
  - reject the main four leptons backgrounds
- signal extracted by fitting  $M_{ell}$

**No significant excess was observed in 428 fb<sup>-1</sup>**

	$N_{\text{exp}}$	$\mathcal{B}_{\text{exp}}^{UL} \times 10^{-8}$	$\mathcal{B}_{\text{obs}}^{UL} \times 10^{-8}$
$e^- e^+ e^-$	$6.1^{+4.3}_{-2.9}$	2.7	2.5
$e^- e^+ \mu^-$	$12.1^{+5.7}_{-4.3}$	2.1	1.6
$e^- \mu^+ e^-$	$10.5^{+5.3}_{-4.3}$	1.7	1.6
$\mu^- \mu^+ e^-$	$20.7^{+6.6}_{-5.5}$	1.6	2.4
$\mu^- e^+ \mu^-$	$7.5^{+4.5}_{-3.2}$	1.4	1.3

**⇒ Most stringent upper limit on all modes**  
(even compared to Belle with 782 fb<sup>-1</sup>)

"Searches for lepton-flavour violation in tau decays at Belle and Belle II" (L.Zani)

# Strategy toward $> 10^{35} \text{ cm}^{-2} \text{ s}^{-1}$ (\*)

⇒ Resume data taking in November 2025 for a long run of 7 months

(\*)  $10^{35} \text{ cm}^{-2} \text{ s}^{-1}$  corresponds to  $\sim 1 \text{ ab}^{-1} / \text{year}$  (for 8 months data taking period)

# Further improvements...

significantly improved B-tagging  
for coming run 1+2 analyses

data quality in run 2  
similar to run 1

## Time-dependent CP violation without signal vertex

arXiv:2506.11196,  
M.Dorigo, S.Raiz, D.Tonelli, R.Zlebcik  
also hep-ph/9907277, A.D.Foland

--- with run 1 data sample  
..... with 5  $\text{ab}^{-1}$

# Summary

- Belle (II) is a unique environment to study modes with missing energy  
 $\mathbf{B} \rightarrow \mathbf{K}^{(*)} \nu \bar{\nu}, \mathbf{K}^{(*)} \tau \tau, \mathbf{K}^{(*)} \tau l, \tau \tau, \tau l, \mathbf{D}^{(*)} \tau \nu, \tau \nu, \mu \nu \dots$
- but also perform precise measurements of CKM UT (CPV or not),  $\tau$  sector, low multiplicity, dark sector ... and many other opportunities
- Belle II with  $\sim 400 \text{ fb}^{-1}$  (run 1) has a sensitivity similar (often better) than Belle ( $\sim 1 \text{ ab}^{-1}$ )

**SuperKEKB is making a tremendous effort to enter in  $10^{35} \text{ cm}^{-2} \text{ s}^{-1}$  world (with precious help from CERN (FCCee team), IHEP, DESY ...)**

Goal of Run 2: by LS 2 (2032), accumulate  $> 5 \text{ ab}^{-1}$

**$\Rightarrow$  many unique results from Belle II**

# Search for $\tau \rightarrow l K_S^0$ at Belle II (+ Belle)

[arXiv:2506.15745]

accepted by JHEP

Belle + Belle II ( $980 \text{ fb}^{-1} + 428 \text{ fb}^{-1}$ )

Reconstruct 4 charged particles (0 net charge) in 1x3 topology

$K_S^0$  reconstruct from  $\pi^+ \pi^-$

Preselection rectangular cuts and BDT classifier

- Use track kinematics, event shape and neutral variables
- Resulting efficiency 10%

Extract signal yield from 2D plane ( $M_\tau$ ,  $\Delta E = E_\tau - E_{\text{beam}}$ )

**no significant signal observed in  $1.4 \text{ ab}^{-1}$**

$$B(\tau \rightarrow e K_S^0) < 0.8 \times 10^{-8} \text{ at } 90\% \text{ C.L.}$$

$$B(\tau \rightarrow \mu K_S^0) < 1.2 \times 10^{-8} \text{ at } 90\% \text{ C.L.}$$

**World most stringent upper limit on all modes (improved by factor 2)**

**more results on  $\tau$  soon**  
(coming tau 2025 conference)

# SuperKEKB, the first new collider in particle physics since the LHC in 2008 (electron-positron ( $e^+ e^-$ ) rather than proton-proton (p-p))

## Phase 1

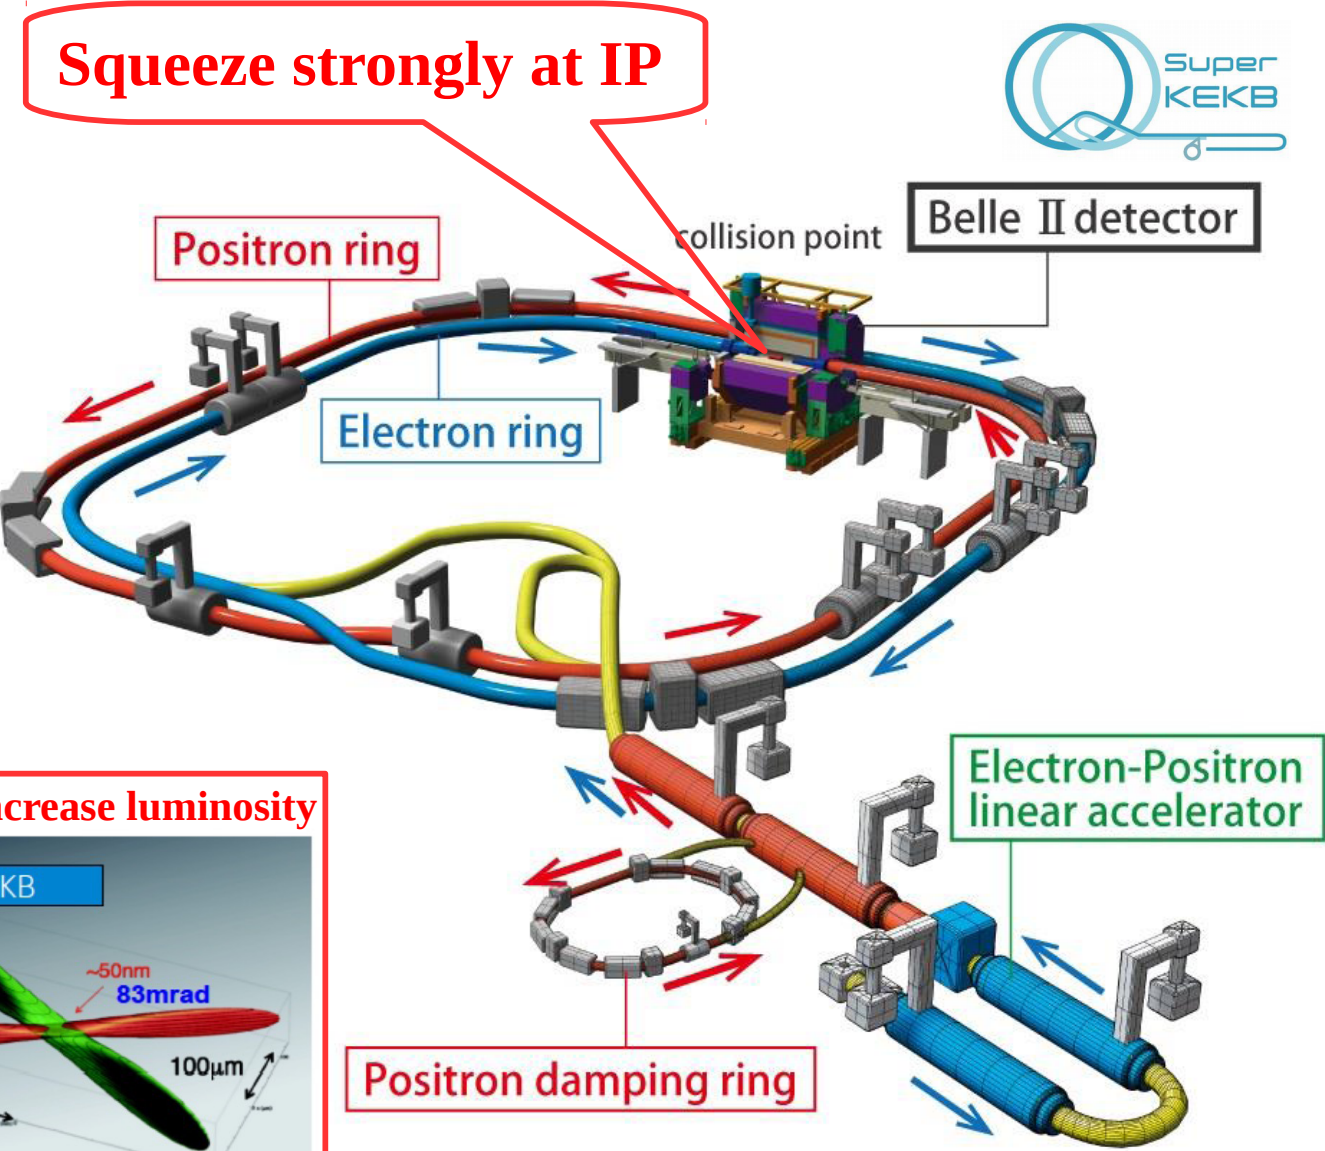

Background , Optics commissioning  
Feb - June 2016

Brand new 3km positron ring

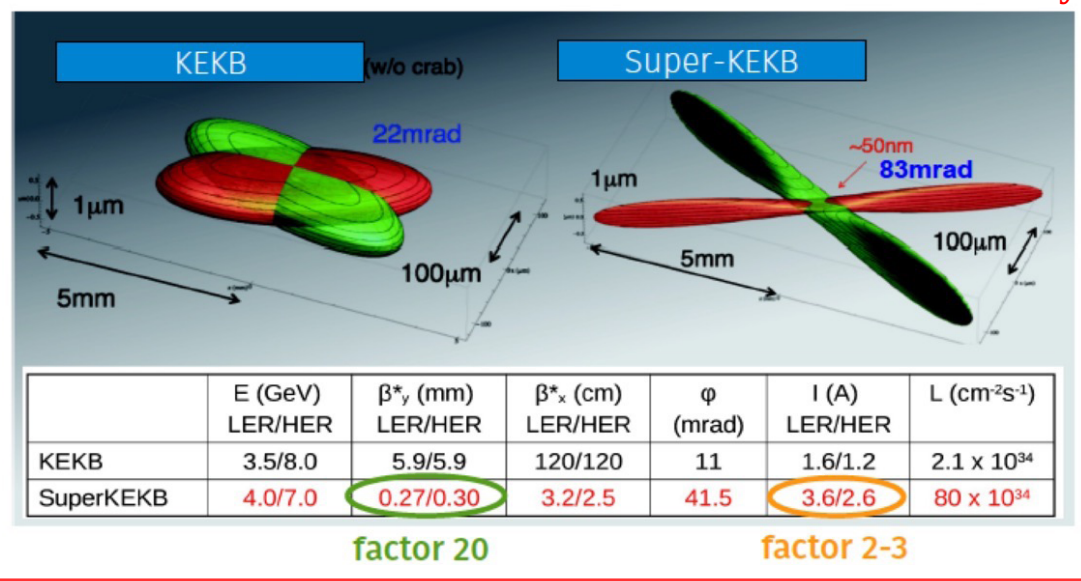

## Phase 2: Pilot run

Superconducting Final Focus  
add positron damping ring  
First Collisions ( $0.5 \text{ fb}^{-1}$ )  
April 27 - July 17, 2018

Phase 3: Physics run  
Since April, 2019

### Nano-beams and more beam current to increase luminosity

$\Rightarrow$  to reach  $\sim 6 \times 10^{35} \text{ cm}^{-2} \text{ s}^{-1}$   
 $\Rightarrow$  cumulate  $50 \text{ ab}^{-1}$  by  $\sim 2040$

# SuperKEKB

## Major works during shutdown

1. Beam pipe cleaning (vacuum sealant (VACSEAL) removal)
  - Countermeasure against SBL
  - @IR (HER/LER), LER wiggler sections (D04, D10, D11)

⇒ Improvement of accelerator stability
2. Collimator works
  - Relocation (LER, D06V2 → D03V4)
  - Damaged jaw replacement (LER D02V1, D05V1)
  - New water-cooled collimator (HER D09V3)

⇒ Protection of Belle II from SBL (D03V3), Beam impedance reduction (D02V1, D05V1), Suppression of abnormal pressure rise (D09V3)
3. Radiation shield reinforcement for full-scale use of NLC
  - Shielding radiation generated by NLC
  - Expansion of radiation control area around Oho experimental Hall

⇒ Background reduction, Beam impedance reduction
4. Electron RF gun replacement
  - New RF-Gun less prone to discharge

⇒ Stable two-bunch injection
5. Installation of ECS into electron BT line
  - Reduction of energy spread of high charged bunch

⇒ Improvement of injected beam quality and injection efficiency
6. Magnet pole replacement of positron BT line
  - Emittance growth mitigation by improving the magnetic field.

⇒ Improvement of injected beam quality and injection efficiency

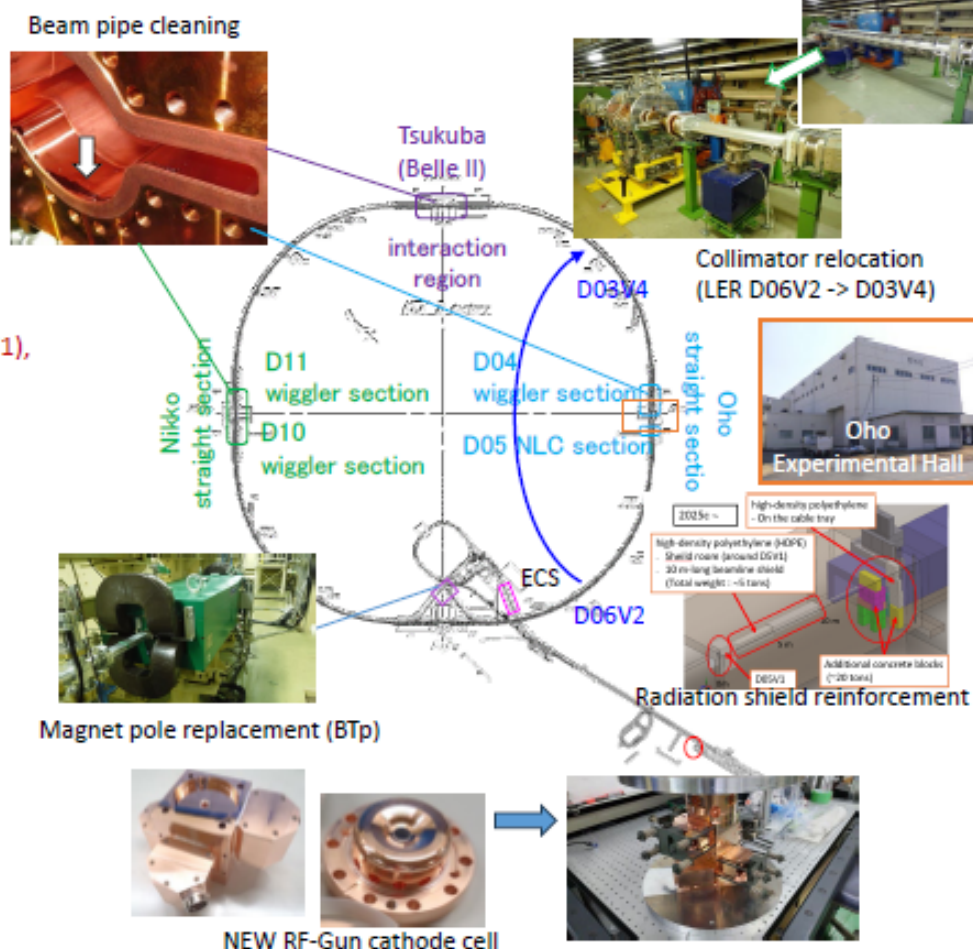

Beam pipe cleaning

Collimator relocation (LER D06V2 → D03V4)

Oho Experimental Hall

Magnet pole replacement (BTp)

NEW RF-Gun cathode cell

# SuperKEKB

## Beam pipe cleaning 2

- Black stains are thought to be consist of liquid-type vacuum sealant (VACSEAL).
  - VACSEAL can enter the beam pipe via the MO-flange.
    - Strong SR irradiation turned VACSEAL into black stains?
  - Some black stains are flaky and easily turn to dusts.
- Black stain removal are being conducted.
  - At **MO-flange connections** most-likely with VACSEAL.
    - It is impossible to identify all MO-flanges with VACSEAL due to lack of records.
  - In sections where many pressure burst was observed with SBLs.
- ⇒ At interaction region (IR), LER wiggler sections (D04, D10, D11)  
 Not at HELICOFLEX-flange (No black stains have been found so far.)
- IR : All MO-flange connections were cleaned.
  - 41 MO-flange connections were opened.
  - Black stains were found in many MO-flanges and removed.
  - 16 HELICOFLEX flange connections left uncleaned.

Interaction region

# Luminosity projection plot

(plan for the coming years)
