Advancing SMEFT Global Analyses: NLO, RGE contributions, and the Role of Flavour Physics

Wednesday 9 July 2025 08:30 (15 minutes)

The Standard Model Effective Field Theory (SMEFT) is an essential tool for probing physics beyond the Standard Model. With New Physics signals remaining elusive, deriving constraints on SMEFT Wilson coefficients is increasingly important in order to pinpoint its low-energy effects. This talk presents comprehensive global fits of SMEFT under the Minimal Flavour Violation (MFV) hypothesis. We establish global limits on Wilson coefficients using both leading and next-to-leading order SMEFT predictions for various observables. Our findings highlight significant interactions among different observables, emphasizing the necessity of integrating diverse data from multiple energy scales in global SMEFT analyses. Even within this flavour-symmetric framework, where Flavour Changing Neutral Currents (FCNC) cannot be generated at tree-level, they significantly contribute via Renormalization Group Evolution (RGE) effects. More in general a consistent treatment of the RGE in global analyses is an often-overlooked aspect which proves to be crucial for analysing properly datasets spanning various energy scales.

Secondary track

T06 - Top and Electroweak Physics

Authors: BIEKOETTER, Anke (Uni Heidelberg); BARTOCCI, Riccardo (JGU Mainz); HURTH, Tobias (Johannes Gutenberg University Mainz)

Presenter: BARTOCCI, Riccardo (JGU Mainz)

Session Classification: T09

Track Classification: T09 - Beyond the Standard Model
