Reminder: Lorentz Invariance Violation

Status on LIV working group (HESS, MAGIC, VERITAS + LST-1)

- 8 BL-Lac & PKS2155 flares combination
 - Lightcurves
 - Reconstruction of the lag
 - Results from real data

-

Experimentally detectable effects

LIV expected effects:

Model-independent modified dispersion relation:

$$E^2 = p^2 c^2 \times \left[1 \pm \sum_{n=1}^{\infty} \left(\frac{E}{E_{QG,n}} \right)^n
ight]$$

Subluminal or superluminal LIV $\rightarrow \pm$ Experiments are only sensitive to n = 1, 2

Note that E_{QG} is often compared to E_{PI} , but could be very different from it

< ロト < 同ト < ヨト < ヨト

(1)

 \Rightarrow Time delay between photons with different energies

$$\Delta t_n \simeq \pm \frac{n+1}{2} \frac{E_h^n - E_l^n}{H_0 E_{QG}^n} \kappa_n(z), \qquad (2)$$

with κ_n the source distance parameter (κ_n increases with z and depends on the considered model), for n = 1, 2.

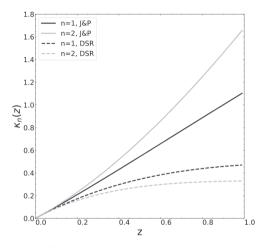

Fig. 1. Different models for κ [Bolmont *et al.* 2022 ApJ]

Time delays

In practice we use the lag parameter

$$\lambda_n = \frac{\Delta t_n}{\Delta E_n \kappa_n(z)} \simeq \pm \frac{n+1}{2H_0 E_{QG}^n}$$
(3)

so we need sources

- up to very high energies and large energy range to maximise $E_h^n E_l^n$
- far away, so that the speed difference is observed as a large enough time delay between photons to be measured: d > 1kpc up to $z \sim 0.1$ and more (interaction with the EBL is limiting for higher $z \Rightarrow$ high luminosity sources)
- and variable

go		

< ロト < 同ト < ヨト < ヨト

γ -LIV working group (HESS, MAGIC, VERITAS + LST-1)

Goal

Get a combined limit using all available sources (GRBs, flaring AGNs, pulsars) detected by all IACT experiments, plus some Fermi-LAT GRBs \rightarrow first population study at TeV energies

Already achieved

- Development of an analysis framework, to simulate, analyse and combine results from different experiments: LIVelihood
- Code tested on simulated data ~> first paper [Bolmont et al. 2022 ApJ]
- Fully compatible with DL3 data format

On going

- Code can now be used on real DL3 data, it is being tested on BL Lac (LST-1) and PKS 2155 Chandra flare (HESS)
- Combination of results from these two sources

PKS2155 Chandra flare lightcurve

To compute the time lag, we need a **template lightcurve** (low energy photons) to compare to high energy photons \implies arrange the photons into low and high energy parts, by taking the median energy (with the full flare $E_{med} = 0.61$ TeV)

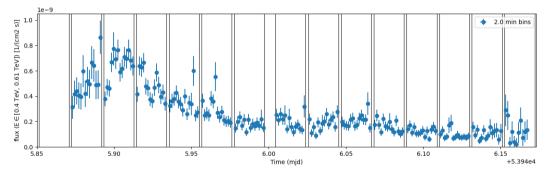

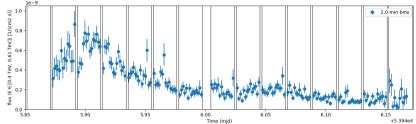

Fig. 2. Lightcurve from public data at low energies. Vertical lines separate runs.

September 16, 2024 7/18

Lightcurves

PKS2155 template lightcurve

But hard to fit the whole lightcurve because of the many free parameters

 $\exists \rightarrow$

э

Lightcurves

PKS2155 template lightcurve

But hard to fit the whole lightcurve because of the many free parameters \rightarrow reduce the analysis to the **4th run** as a first step

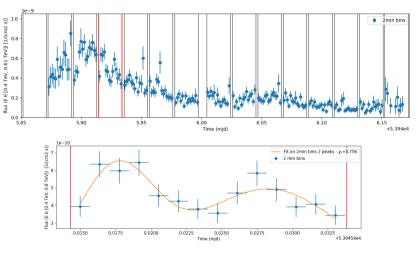

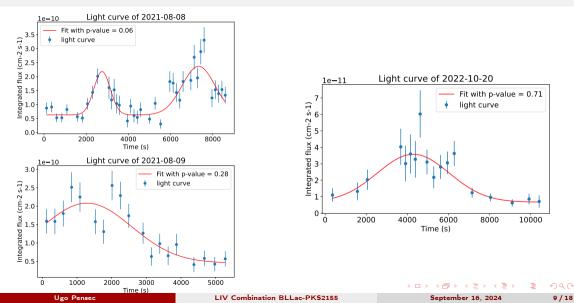

Fig. 3. Analytical fit of the light curve on low energies (in this run [0.4,0.79] TeV)

BL-Lac lightcurves

Likelihood technique

Likelihood formula [Martinez & Errando, 2008 Astrop.Phys.]

$$\frac{dP}{dE_m dt} = \frac{w_s}{N_s} \int A(E_t, \epsilon) M(E_t, E_m) F_s(E_t, t; \lambda) dE_t + \text{bkg. contrib.}$$

A is the effective area, M the energy migration matrix, and F_s is the flux

 λ is the likelihood parameter

$$L(\lambda) = -\sum_{i} \log\left(rac{dP}{dE_{m}dt}(E_{m}, i, t_{i}; \lambda)
ight)$$

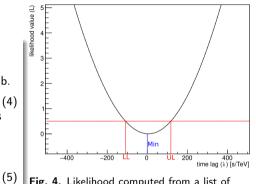

Fig. 4. Likelihood computed from a list of simulated photons following the template time distribution

September 16, 2024

10/18

Reconstruction of the lag from simulations

Process

- Simulate high and low energy photons from this template lightcurve at low energies and the energy spectrum
- Compute the likelihood curve for the time lag parameter λ
- ullet Find the minimum and the lower and upper limits at 1σ

Sanity check: Distribution for $\lambda = 0$

Repeat 1000 simulations to get the distribution of reconstructed lags (for the J&P model and in the n=1 case)

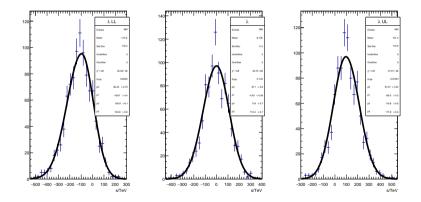

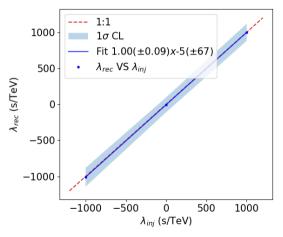

Fig. 5. Distribution of the reconstructed lags from 1000 simulations, with 0 injected lag. Left and right panels are the lower and upper limits of the confidence interval (1σ) .

LIV Combination BLLac-PKS2155

September 16, 2024 12 / 18

Reconstruction of the lag

Repeat with injected lag in the simulated dataset

Everything works nicely!

Now let's try on real data

Fig. 6. Plot of the reconstructed VS injected lag

September 16, 2024 13 / 18

Likelihood from real data

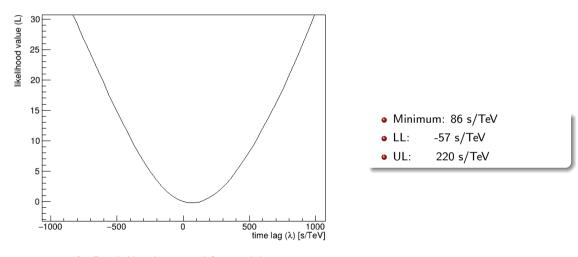

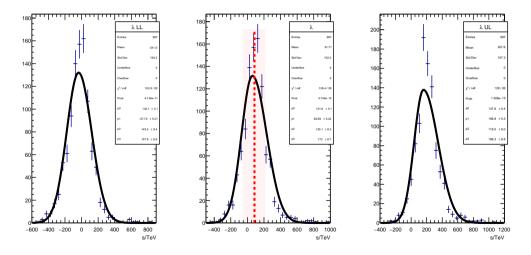

Fig. 7. Likelihood computed from real data

LIV Combination BLLac-PKS2155

Calibrated statistical error

Ugo Pensec	LIV Combination BLLac-PKS2155	September 16, 2024	15 / 18
------------	-------------------------------	--------------------	---------

Systematic errors

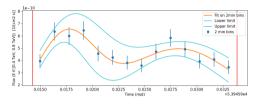

Fig. 9. Errors on lightcurve parameters

Spectral index	Redshift	Background	Energy Scale
± 0.02	$\pm 10^{-5}$	$\pm 20\%$	$\pm 10\%$

$$L(\lambda, \vec{\theta}) = L_{S}(\lambda) + L_{template}(\vec{\theta}_{LC}) + L_{\gamma}(\theta_{\gamma}) + L_{B}(\vec{\theta}_{B}) + L_{ES}(\theta_{ES}) + L_{z}(\theta_{z})$$
(6)

with

$$L_{x}(\vec{\theta}_{x}) = \sum_{i} \frac{(\theta_{x,i} - \bar{\theta}_{x,i})^{2}}{2\sigma_{x,i}^{2}},$$
(7)

assuming a normal distribution.

Then, re-do the whole process with these nuisances \rightarrow get a mean value + errors \rightarrow get a limit

LIV Combination BLLac-PKS2155

Conclusions and next steps

- Successful test of combination of real data
- Good limit obtained
- Improvement could come from better analysis of the sources, or adding more sources
- \bullet Combine this result with other results in the $\gamma {\rm LIV}$ working group
- The final result should be published and then be used in the HESS/MAGIC/VERITAS/LST-1 working group
