Type: Oral presentation

Particle acceleration in UFOs

mercredi 9 avril 2025 10:45 (15 minutes)

Ultra Fast Outflows (UFOs) are sub-relativistic dense winds of wide aperture angle, launched from Active Galactic Nuclei, at which strong shocks (Mach number » 1) are expected to form.

At these shocks, particle energisation through diffusive shock acceleration (DSA) should lead to the copious production of gamma rays and neutrinos, in the interaction of accelerated charged particles and the surround-ing circumnuclear medium.

We model proton acceleration through DSA at UFO shocks and estimate the associated high-energy gammaray and neutrino fluxes, and investigate the prospects for detection with current and next generation gammaray and neutrino observatories.

For a selected list of nearby UFOs, we identify the best candidates for detection with next generation gammaray observatories such as CTAO, and discuss the potential for detection with neutrino observatories such as IceCube.

Astrophysics Field

Cosmic rays / Gamma rays / Particle acceleration
