CAEN  
NORMANDIE

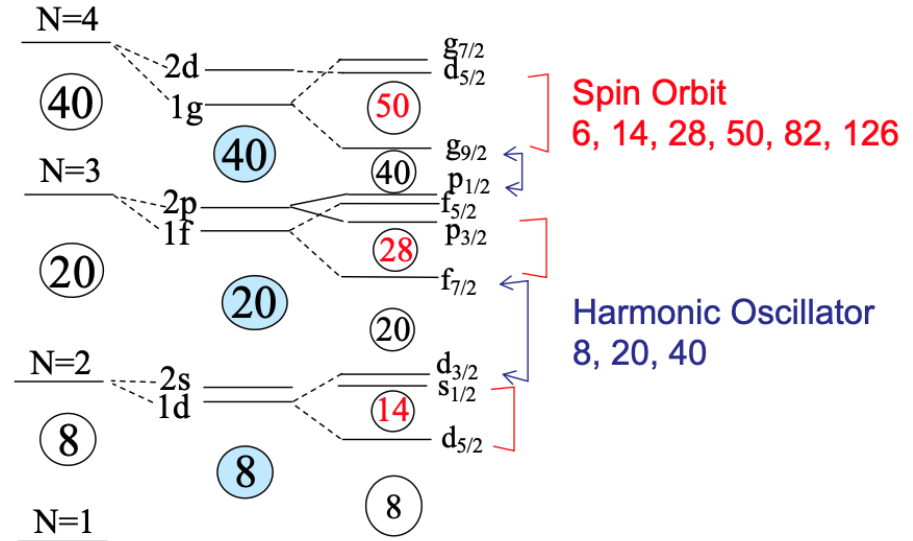

# Early Mean Fields: HO to SO magic numbers

- The Harmonic Oscillator  
potential magic numbers: 2, 8,  
20, 40... worked well for  
lighter systems.

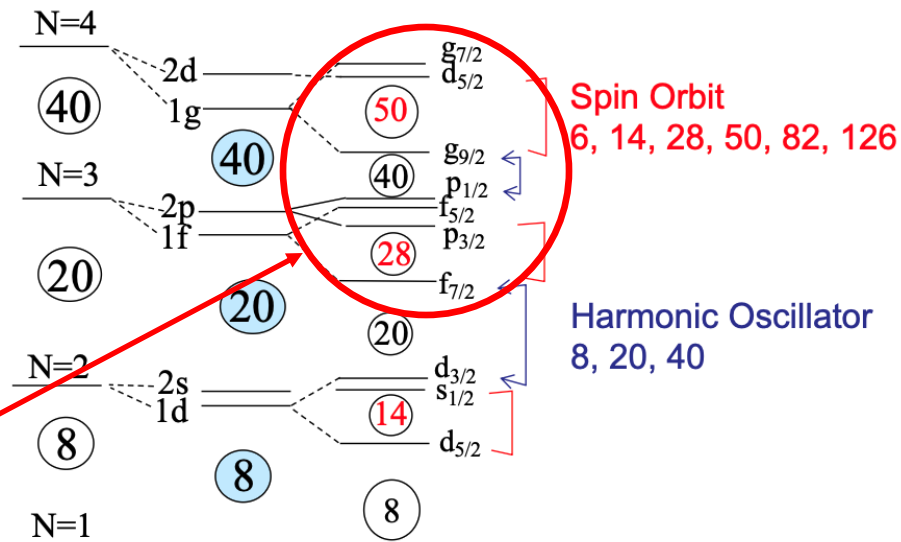

# Early Mean Fields: HO to SO magic numbers

- The Harmonic Oscillator potential magic numbers: 2, 8, 20, 40... worked well for lighter systems.
- Spin-Orbit interaction (76 years ago) took over to explain magic numbers in heavier systems.

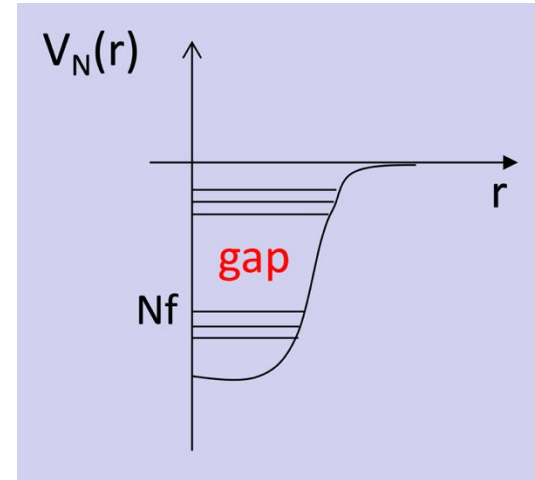

# Early Mean Fields: HO to SO magic numbers

- The Harmonic Oscillator potential magic numbers: 2, 8, 20, 40... worked well for lighter systems.
- Spin-Orbit interaction (76 years ago) took over to explain magic numbers in heavier systems.
- $^{68}_{28}\text{Ni}_{40}$  is at the verge of turning from HO shell gap (N=40) to SO shell gap (N=50).

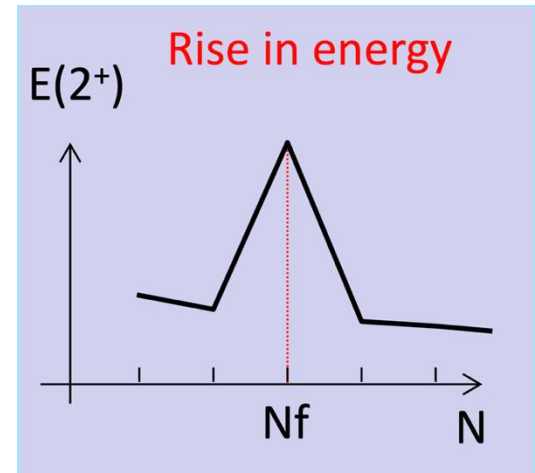

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

# Magicity & $^{68}\text{Ni}$

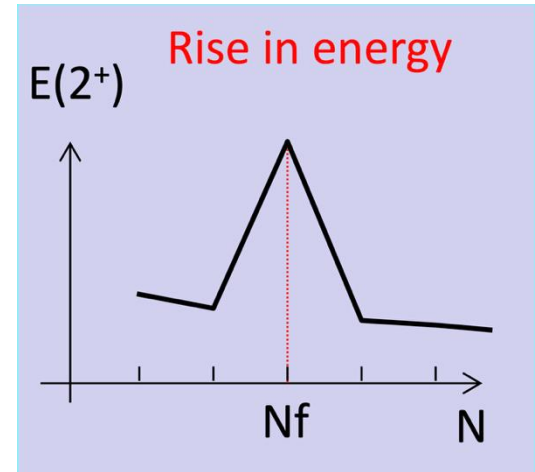

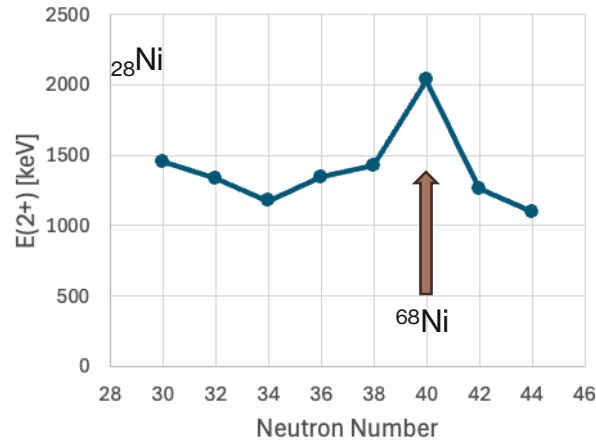

- Characteristics of **magicity**:
  - A relatively higher  $E(2^+)$  excitation energy.

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

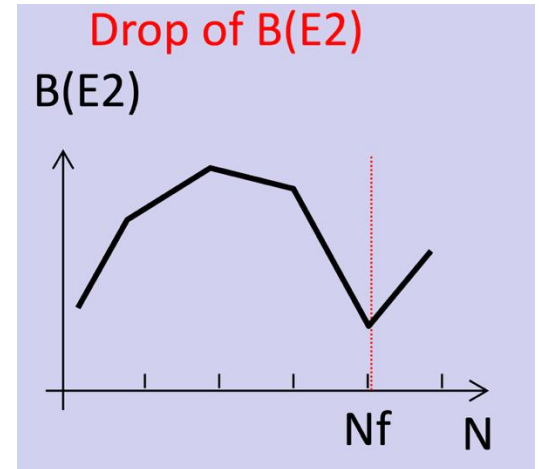

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

- Drop in  $B(E2)$  value.

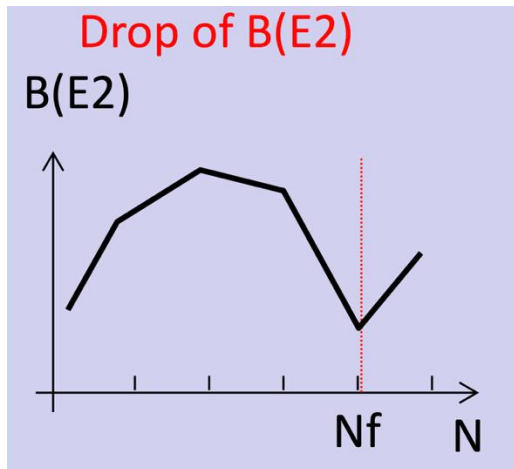

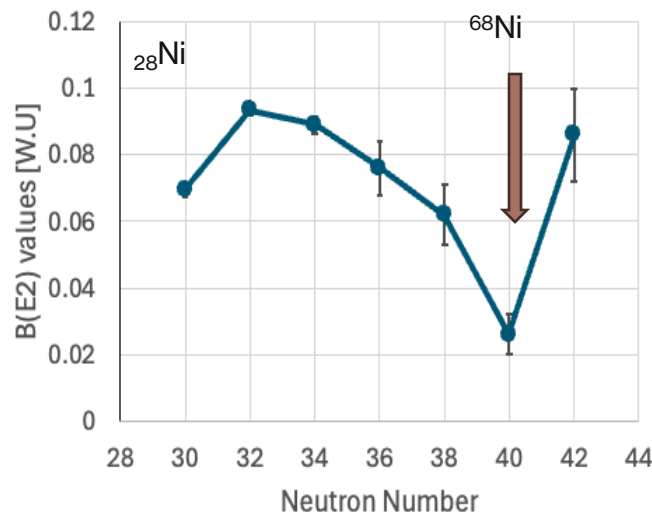

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

👍 Drop in  $B(E2)$  value.

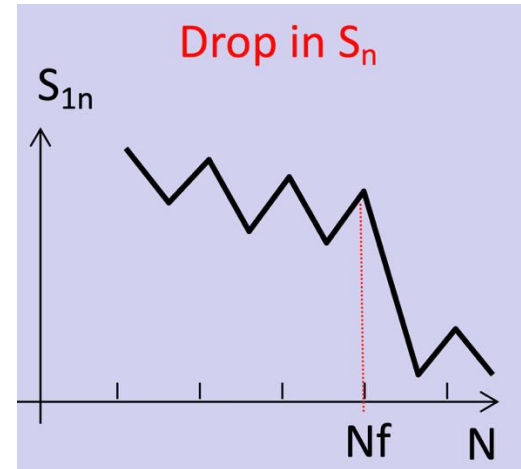

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

👍 Drop in  $B(E2)$  value.

- Drop in  $S_n$ .

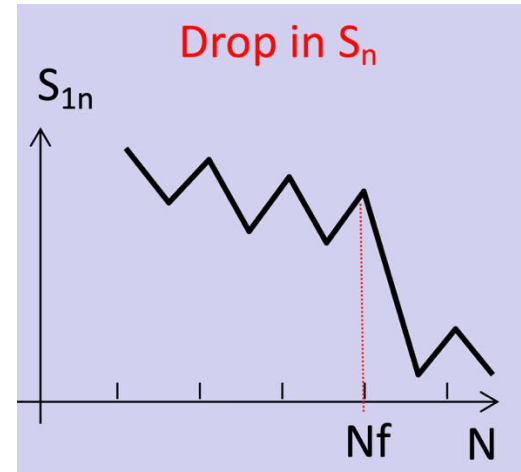

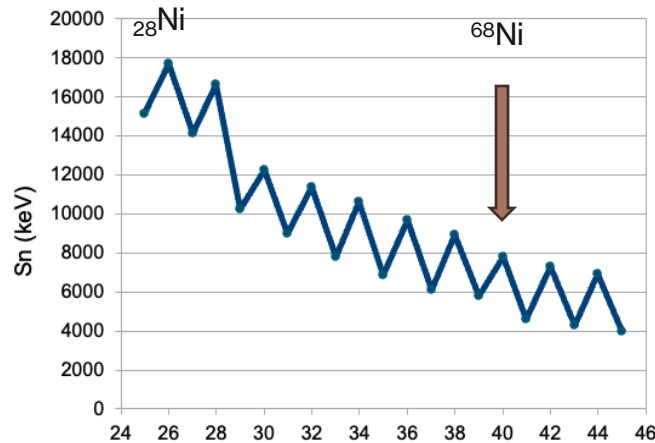

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

👍 Drop in  $B(E2)$  value.

👎 Drop in  $S_n$ .

# Magicity & $^{68}\text{Ni}$

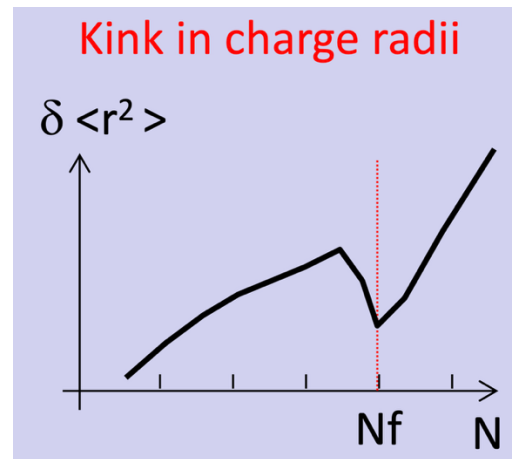

- Characteristics of **magicity**:

- 👍 A relatively higher  $E(2^+)$  excitation energy.

- 👍 Drop in  $B(E2)$  value.

- 👎 Drop in  $S_n$ .

- Kink in charge radii.

# Magicity & $^{68}\text{Ni}$

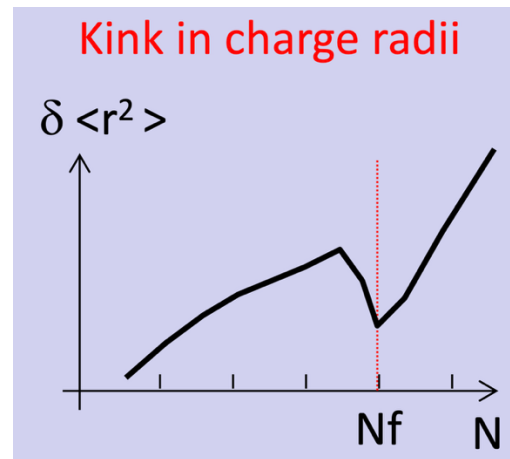

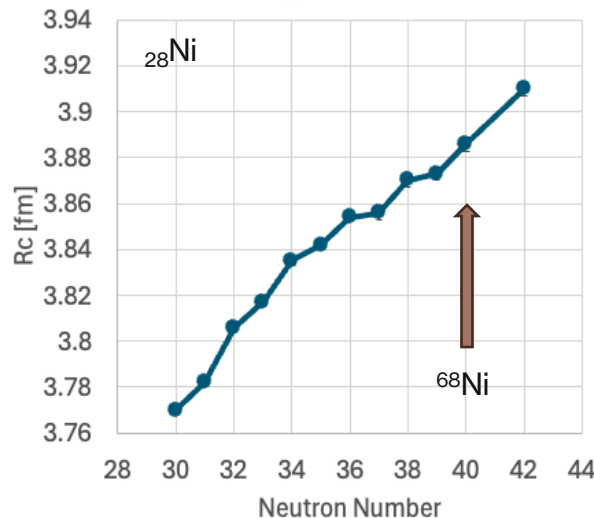

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

👍 Drop in  $B(E2)$  value.

👎 Drop in  $S_n$ .

👎 Kink in charge radii.

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

👍 A relatively higher  $E(2^+)$  excitation energy.

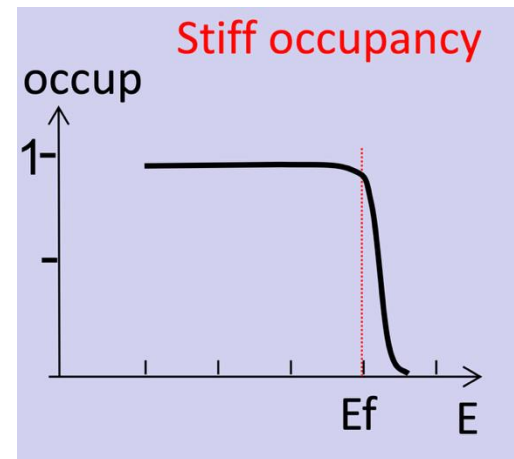

👍 Drop in  $B(E2)$  value.

👎 Drop in  $S_n$ .

👎 Kink in charge radii.

🤔 Occupancy.

→ Becomes an important deciding factor

# Magicity & $^{68}\text{Ni}$

- Characteristics of **magicity**:

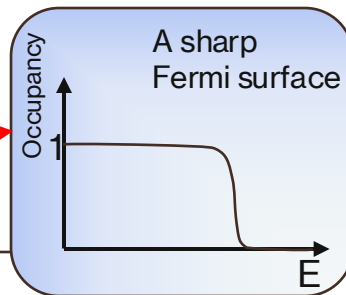

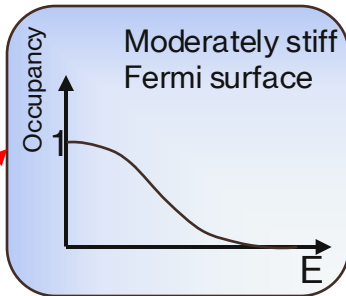

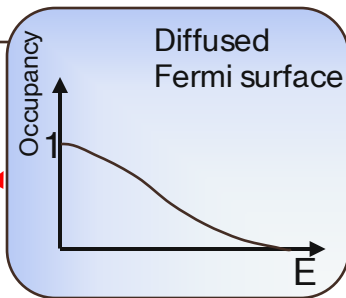

👍 A relatively higher  $E(2^+)$  excitation energy.

👍 Drop in  $B(E2)$  value.

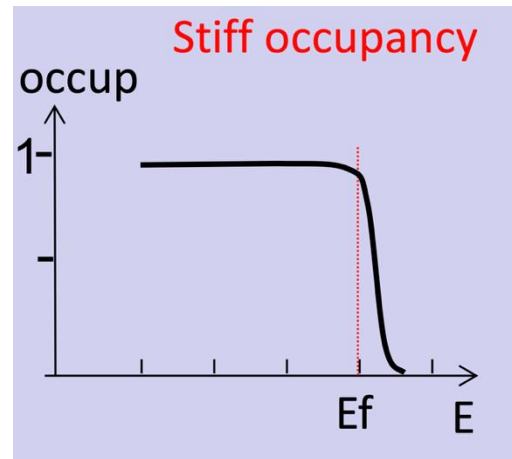

👎 Drop in  $S_n$ .

👎 Kink in charge radii.

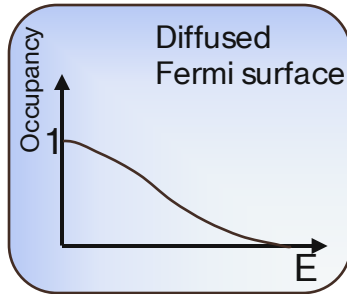

🤔 **Occupancy.**

- Transfer reactions can help determine this occupancy.
- Removing a neutron, probes the **occupancy of the  $p_{1/2}$ ,  $p_{3/2}$ , and  $f_{5/2}$** .  $\rightarrow {}^{68}\text{Ni} (p,d) {}^{67}\text{Ni}$

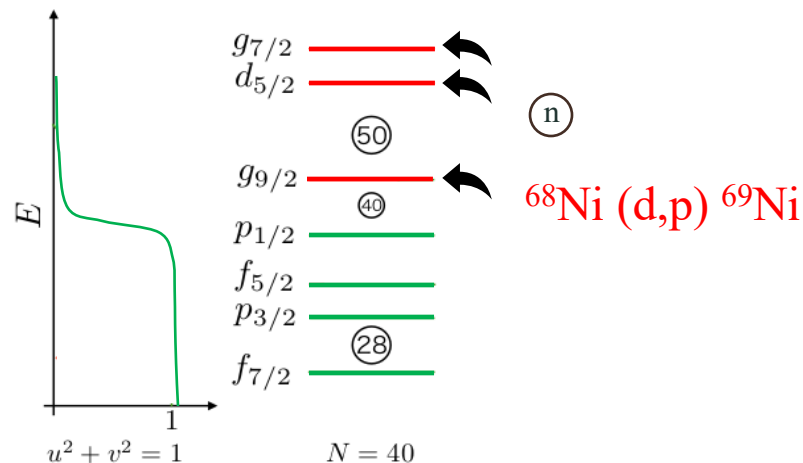

# Neutron transfer

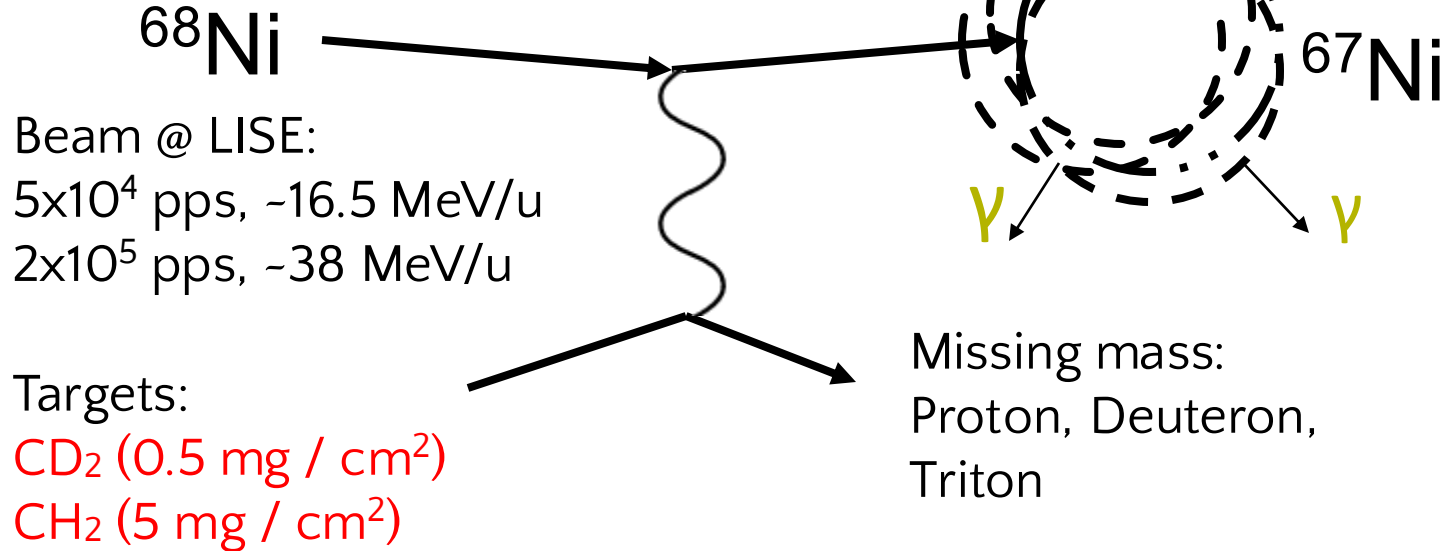

- Transfer reactions can help determine this occupancy.
- Removing a neutron, probes the **occupancy of the  $p_{1/2}$ ,  $p_{3/2}$ , and  $f_{5/2}$** .  $\rightarrow {}^{68}\text{Ni} (p,d) {}^{67}\text{Ni}$

## N = 50 Shell Gap

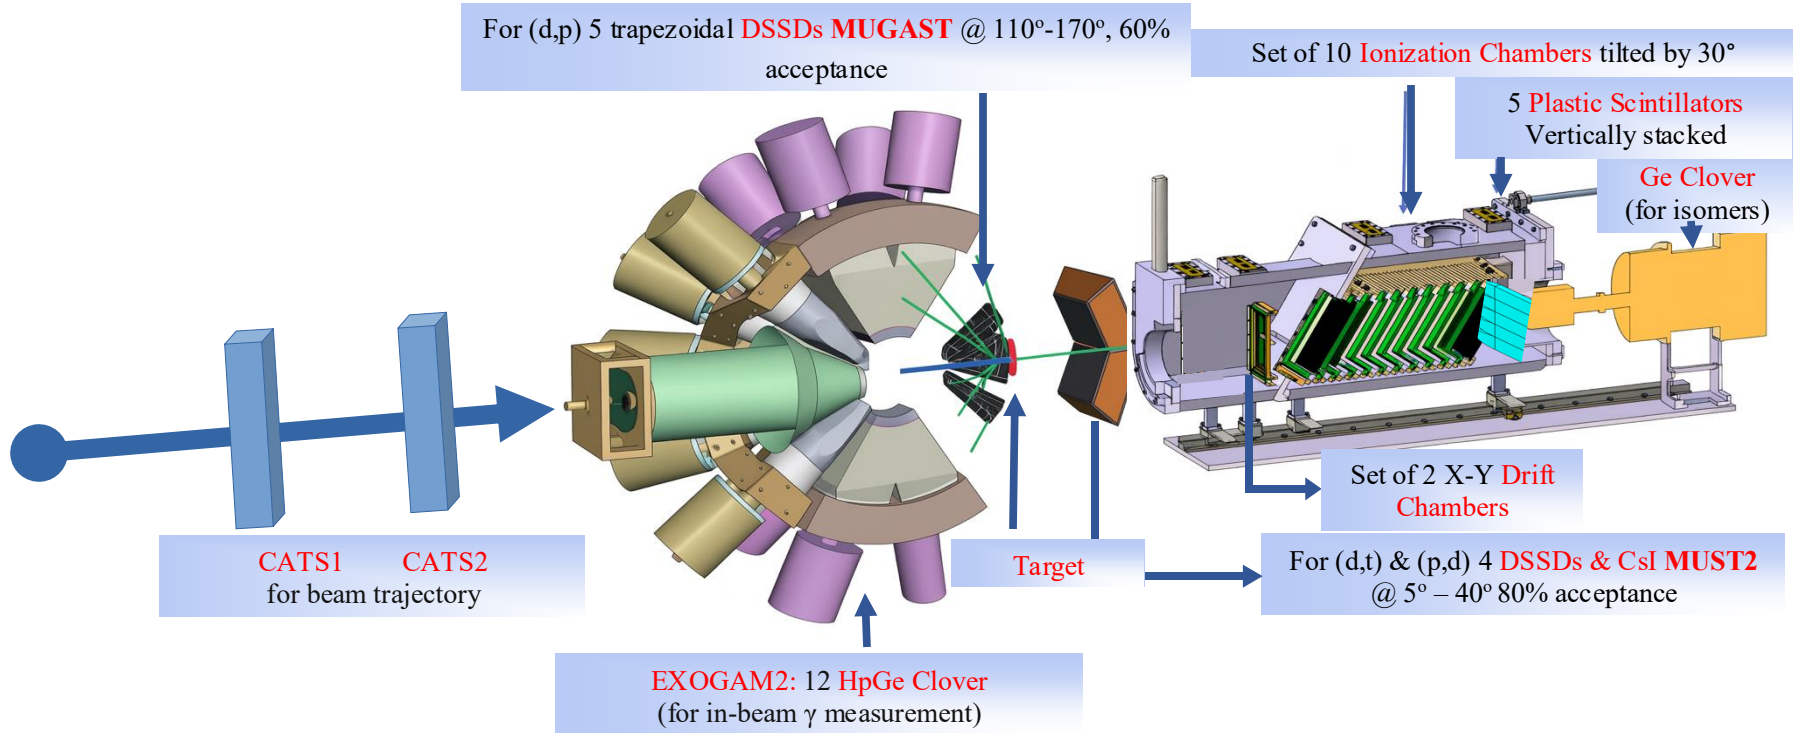

Given by  $\langle E(d_{5/2}) \rangle - \langle E(g_{9/2}) \rangle$ .

# Experimental Setup

# Experimental Setup

# Experimental Setup

For (d,p) 5 trapezoidal **DSSDs MUGAST** @  $110^\circ$ - $170^\circ$ , 60% acceptance

Set of 10 **Ionization Chambers** tilted by  $30^\circ$

5 **Plastic Scintillators**  
Vertically stacked

**Ge Clover**  
(for isomers)

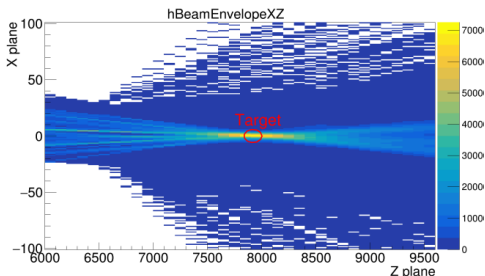

Set of 2 **X-Y Drift Chambers**

For (d,t) & (p,d) 4 **DSSDs & CsI MUST2**  
@  $5^\circ$  –  $40^\circ$  80% acceptance

**Target**

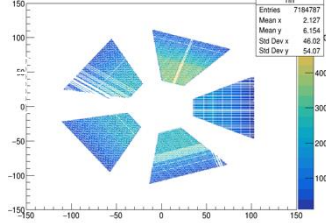

**EXOAM2: 12  $\text{HpGe}$  Clover**  
(for in-beam  $\gamma$  measurement)

**CATS1 CATS2**  
for beam trajectory

# Experimental Setup

Mugast impact construction

For (d,p) 5 trapezoidal **DSSDs MUGAST** @ 110°-170°, 60% acceptance

Set of 10 **Ionization Chambers** tilted by 30°

5 **Plastic Scintillators**  
Vertically stacked

**Ge Clover**  
(for isomers)

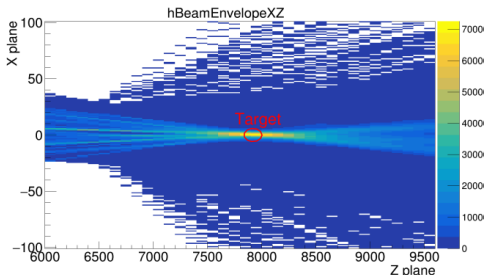

Set of 2 **X-Y Drift Chambers**

For (d,t) & (p,d) 4 **DSSDs & CsI MUST2**  
@ 5° – 40° 80% acceptance

**Target**

- We study  $^{68}\text{Ni}$  with the aim:

## To study

The  $N = 50$  shell gap.

The magicity at  $N = 40$  through sharpness of Fermi Surface.

## What we see so far

The  $5/2^+$  state in  $^{69}\text{Ni}$  and its direct decay to the ground state.

The  $5/2^-$  and  $3/2^-$  states along with their gamma transitions.

## What remains to be done

- Use of Drift Chambers could allow to select 2-body reactions and suppress the BU component.
- Remaining  $L=2$  transfers (and possibly all remaining) angular distributions to get the full strength.
- Angular distribution for each state can be obtained by gating on gamma rays.
- The full analysis should lead to better resolution.
- The contribution of  $9/2^+$  isomer to the Ex. Plot.

- A key nucleus to understand the structures of more exotic nuclei like towards the  $^{60}\text{Ca}$  or  $^{78}\text{Ni}$ .
- Another benefit of doing this study is to get the S-O splittings of the p, f, and possibly the g orbitals.

# Our Physics Case

# Our Physics Case

- At the same time, by means of neutron adding and removing reactions in  $^{68}\text{Ni}$ , we get a unique access to the **Spin-Orbit splittings of the pfg shells**.
- These Spin-Orbit partners can be MeVs apart.
- It has been observed that the SO splitting scales with  $2L+1$  with approx.  $A^{-2/3}$  trend and depends on the number of **nodes n** of radial wave-function.
- This sitting could be compared to other Ni isotopes and add another data point as another check for the validity of this trend.
