

DCOD

status & future developments

SidAli CHERRRATI, Nicolas DOSME, Souhir ELLOUMI, Matias VECCHIO

- Few issues with this upgrade
 - A librairie is no longer available (libasis)
 - The compiler is more demanding.
«error: nondispatching call to nonabstract subprogram of abstract type with nonstatic class-wide pre/postconditions »
- Expected Outcome:
 - Better compatibility with current distributions (Debian 12)
 - GCC 7.3 → GCC 12.3
 - Performance improvement
- Used for test (See G. BEAULIEU slides)
- First tests done on a Debian 13 (security support until august 2028)

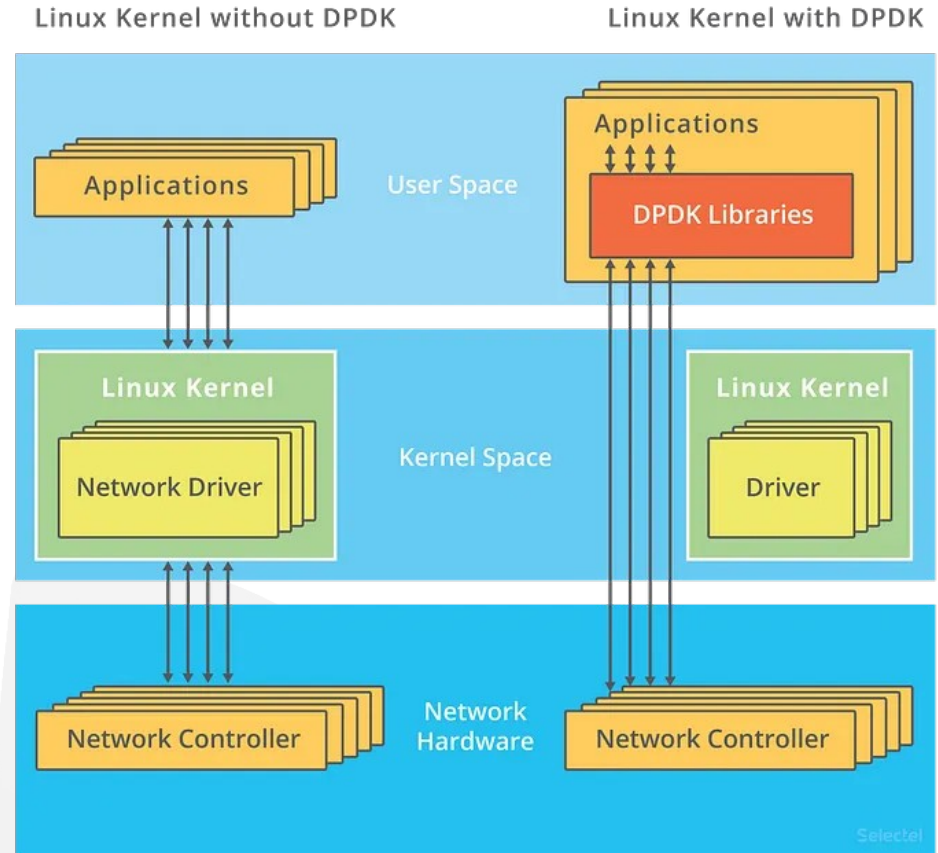

- Docker (Matias) :
 - Easier deployment
 - Dev environment for Narval Actor
 - Cloud
 - Kubernetes ?
- DaaS : DAQ as a Service

- Work in progress with GANIL DAQUP (Souhir & Matias)
 - Debian Packages
 - New API (REST instead of SOAP)
 - Log centralization (considering GELF - Graylog Extended Log Format)
- CI/CD (Matias):
 - Building Docker images
 - Building Debian Packages
 - PEM replacement ?
 - Used to deploy others codes than DCOD

- (SidAli)
- Open-source library (Intel)
- Need to enable IOMMU in kernel
- Complex network configuration
 - ARP, IP, Ping,...
- Features depending on the network card model

- DMA (Direct Memory Access)
 - Network card → CPU RAM
 - Network card → GPU RAM (need RDMA)
- Tests
 - 10Gb/s → OK
 - 2*10Gb/s sur 25Gb/s → OK
 - 25Gb/s →
 - 40Gb/s →

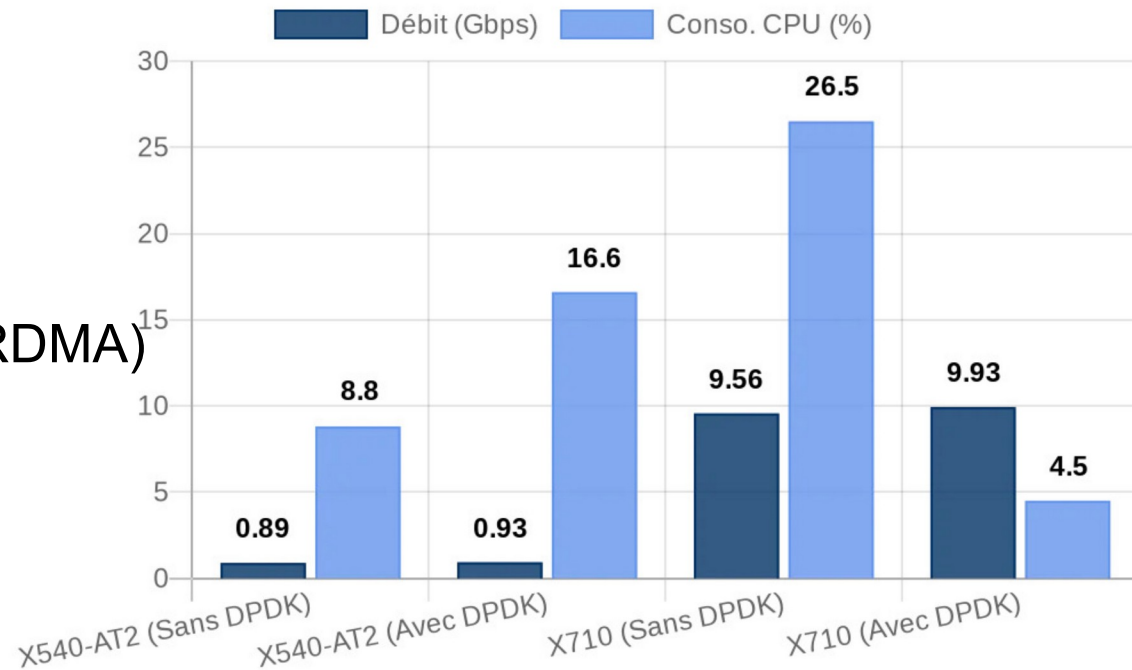

Figure: Serveur Dell PowerEdge R430

- Debian 13 is released since August → new tests to do
- New Compiler is released since July → new tests to do
- DCOD API evolution → no modification for AGATA
- Docker → OK but need to do performance tests
- DPDK → seems promising (limitations on hardware selection)
- Docker + DPDK → maybe
- Docker + DPDK + Cloud → not easy...
