LSST Galaxies Science Collaboration

Scientific goals

Co-chairs: Simona Mei and Sugata Kaviraj

Number of members: ~370 (new members are very welcome, no requirements on time commitment)

Regular activities: monthly telecons, face-to-face meetings, LSB WG challenges

Core goal: perform extra-galactic science over ~90% of cosmic time

Main advances expected from LSST:

- **Revolutionary statistics** across full spectrum of extra-galactic studies
- Vast **discovery space in the 'low-surface-brightness' regime** (e.g. dwarfs outside local group, intra-cluster light, faint galaxy outskirts, tidal features)
- **Statistical studies of rare and/or extreme objects** (e.g. starbursts, massive high-z systems) especially when combined with IR surveys
- **Intersection with computer science** will drive **new technologies** (e.g. machine learning) for big data astrophysics: **galaxy classification, properties; large scale structure; cluster detection/environment.**

LSST Galaxies Science Collaboration

The Legacy Survey of Space and Time (LSST) is a ground-breaking, 10-year optical survey of the entire southern sky, which will be carried out by the Simonyi Survey Telescope at the Vera C Rubin observatory. The project is jointly funded by the National Science Foundation (NSF) and the US Department of Energy (DOE). The LSST Galaxies Science Collaboration (LSST GSC) is a scientific organization charged with using LSST data to understand the formation and evolution of galaxies over cosmic time.

The LSST GSC is one of the original nine LSST Science Collaborations founded in 2006, and made important contributions to the LSST Science Book released in 2009. This detailed science case helped LSST become the top-rated priority for ground-based astronomical facilities in the 2010 Decadal Survey and obtain NSF and DOE funding. Scientists in the LSST GSC will conduct a wide range of extragalactic research programs with LSST data, and will help the LSST Project develop critical data and software products that will enable astronomers from all over the world to conduct cutting-edge research programs of their own. Information about the organization and structure of the LSST GSC can be found in the LSST GSC Charter.

Sugata Kaviraj and Simona Mei serve as the current Chairs of the LSST GSC. Previous LSST GSC Chairs were Manda Banerji, Brant Robertson, Michael Cooper and Harry Ferguson.

LSST Galaxies Science Collaboration

CURRENT MAIN DISCUSSIONS

1. New proposition for the Science Validation coverage
2. The DP1 release on June 30th

LSST Galaxies Science Collaboration

SCIENCE VALIDATION

Pilot observations for the Science Validation (SV) surveys could begin as soon as mid-June 2025, and would continue through September. The project envisions a “soft start” to SV surveys, beginning with pilot observations of a few hours per night interleaved with other engineering activities, and gradually increasing the duty cycle for SV survey observations

SITCOMTN-005 and Rubin Observatory Plans for an Early Science Program (RTN-011) describe a baseline SV survey concept, however we recently had a new coverage proposition

LSST Galaxies Science Collaboration

SCIENCE VALIDATION UPDATED PLANS

The Rubin Science Collaborations were solicited to give feedback on new propositions for the SV fields.

The project plans to release an updated version of Rubin Observatory Plans for an Early Science Program (RTN-011) that includes information on the recommended SV survey design. This plan may evolve over the course of the remainder of commissioning. The idea is to (1) verify construction completeness; (2) demonstrate operation readiness; (3) optimize early science and data management

LSST Galaxies Science Collaboration

BASELINE SV DESIGN

Interleave Deep and Wide survey components (minimum 30 nights)
from [SITCOMTN-005](#):

Deep: $\sim 100 \text{ deg}^2$ *ugrizy* to 10 yr LSST Wide Fast Deep (WFD)
equivalent depth $\rightarrow$ then increase depth

- Optimized for testing coadds at LSST 10-year survey full depth

Wide: $\sim 1000 \text{ deg}^2$ *griz* to 1-2 yr LSST WFD equivalent depth $\rightarrow$ then
increase area

- Optimized for testing alerts at survey scale, both infrastructure and
science validation

LSST Galaxies Science Collaboration

Enhanced SV Survey Design Candidate

Deep: LSST DDFs (total $\sim 60 \text{ deg}^2$)
in *ugrizy*

South Galactic cap DDFs visible in
July-September (ELAIS_S1,
XMM_LSS, ECDFS, and EDFSa +
EDFSb)

Wide: LSST Year 1 WFD in *ugrizy*
constrained to a region around
the ecliptic, e.g., $\pm 10 \text{ deg}$

The actual volume of delivered
science-grade data from the SV
surveys might be a fraction of the
design

From Keith Bechtol's presentation to the SC chairs

LSST Galaxies Science Collaboration

VISIBILITY OF THE LSST Deep Drilling Fields

Visibility of LSST Deep Drilling Fields

Only one out of the four LSST DDFs located in the south Galactic cap is visible by early July. All four become visible for more of the night by September.

g 10
r 24
i 28
z 23
y 24

Comparable to
LSST Year 1 in
Wide
component

From Keith Bechtol's presentation to the SC chairs

LSST Galaxies Science Collaboration

Enhanced SV Survey Design Variant

No constraint on RA for Wide component (i.e., would wrap around the sky if continued for a full year)

Baseline survey footprint, including *griz* only in North Ecliptic Spur and fewer visits in dusty Galactic plane

This variant yields wider area template coverage from Wide component, but has fewer visits per band

LSST DDFs are largely unchanged

From Keith Bechtol's presentation to the SC chairs

LSST Galaxies Science Collaboration

Enhanced SV Survey Design Variant visit

z 13
y 18

Comparable to
LSST Year 1 in
Wide
component

From Keith Bechtol's presentation to the SC chairs

OUR SC RECOMMENDATIONS

- In general, we strongly support the first proposition in your presentation: the “Enhanced SV Survey Design Candidate” compared to the other variants. We have a general preference for fewer visits on the Galactic plane, which is highly contaminated by dust (not ideal for extragalactic science), and a recommendation to increase depth in dust-free areas.
- We recommend observing all the Rubin Deep Drilling Fields to a ~ 10 -year depth and in all bandpasses. Our top priorities are the Euclid Deep Field South, Cosmos, and XMM-LSS. The latter field is equatorial and has more than 100,000 redshifts available from DESI.

LSST Galaxies Science Collaboration

OUR SC RECOMMENDATIONS

- Low Surface Brightness (LSB) science is very important for our SC. The RA constraint works best for us to obtain observations of the Stripe 82 and the Abell 194 cluster in which already known LBS objects will permit us to optimize our algorithms. A key point for our collaboration is to maximize the dither size for both the DDF and the wide area, with the goal of preserving the signature of the extended LSB features after background subtraction.

LSST Galaxies Science Collaboration

DP1 release

- DP1 release on June 30th DP1 will contain approximately 2000 exposures in seven fields taken during the LSSTComCam on-sky commissioning campaign.
- We will have a presentation on the DP1 release at our next telecon on June 26th
- Participation to the Rubin DP1 Data Academy on June 30th - July 3rd
 - Interactive tutorials and networking sessions for an accelerated learning experience with the Rubin data products, pipelines, and services. Student participation is encouraged. Academy sessions are recorded and linked from the webpage. <https://rubinobservatory.org/for-scientists/events-deadlines/events-rda>

LSST Galaxies Science Collaboration

DP1 Fields

Table 2: ComCam target fields and pointing centers that are to be included in the DP1 dataset. ICRS coordinates are shared in units of decimal degrees.

Field Code	Field Name	Right Ascension	Declination
		<i>deg</i>	<i>deg</i>
47 Tuc	47 Tuc Globular Cluster	6.02	-72.08
Rubin SV 38 7	Low Ecliptic Latitude Field	37.86	6.98
Fornax dSph	Fornax Dwarf Spheroidal Galaxy	40.00	-34.45
ECDFS	Extended Chandra Deep Field South	53.13	-28.10
EDFS	Euclid Deep Field South	59.10	-48.73
Rubin SV 95 -25	Low Galactic Latitude Field	95.00	-25.00
Seagull	Seagull Nebula Seagull	106.23	-10.51

Thanks!
