

New ML methods for ν_e interaction identification @T2K near detector

Anaëlle Chalumeau

Réunion du vendredi - LPNHE

11/04/2025

Overview

- Why neutrinos are interesting
- T2K and ν_e (electronic neutrinos)
- Why we need to improve the ν_e selection
- 2 new PID* methods with ML: Transformer & Variational Auto-Encoder
- The Transformer PID method
 - What is a Transformer
 - How we can apply it for the ν_e selection
 - Vision Transformer
 - First performances
- A glanced at the Variational Auto-Encoder method

*PID = Particle IDentification

Why neutrinos are interesting

Where are they?

radioactivity

nuclear reactions in
nuclear power plants

nuclear reaction in stars

cosmic rays collision
with the atmosphere

(and similar experiments)
create specifically a
beam of neutrinos

Why neutrinos are interesting

They oscillate!

Why neutrinos are interesting

They oscillate!

$$P(\nu_\mu \rightarrow \nu_e) = f(\theta, \delta)$$

Why neutrinos are interesting

They oscillate!

$$P(\nu_\mu \rightarrow \nu_e) = f(\theta, \delta)$$

$$P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e) = f'(\theta, \delta)$$

Why neutrinos are interesting

They oscillate!

$$P(\nu_\mu \rightarrow \nu_e) = f(\theta, \delta)$$

$$P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e) = \boxed{f'(\theta, \delta)}$$

neutrinos & anti-neutrinos
don't oscillate the same way

Why neutrinos are interesting

They oscillate!

$$P(\nu_\mu \rightarrow \nu_e) = f(\theta, \delta)$$

$$P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e) = \boxed{f'(\theta, \delta)}$$

neutrinos & anti-neutrinos
don't oscillate the same way

could explain why there was
more matter than anti-matter
after the big-bang i.e. **why we
exists**

	$\rightarrow \pi^- e^+ \nu_e$	40.55
μ^+	$\rightarrow e^+ \bar{\nu}_\mu \nu_e$	100

T2K and ν_e (electronic neutrinos)

- ν_e of the beam are an irreducible background
 - ν_e are the signal at SK
- ⇒ very important to characterize the ν_e component at ND280
- ⇒ need Particle Identification for ν_e selection
- ⇔ identifying **e** vs **μ, γ, π, p**

how to detect uncharged particles (like ν) in a detector that can only detect charged ones?

→ by detecting the charged particle from ν interaction* in the detector:

*called Charged Current (CC) interaction

T2K and ν_e (electronic neutrinos)

- ν_e of the beam are an irreducible background
- ν_e are the signal at SK

⇒ very important to characterize the ν_e component at ND280

⇒ need Particle Identification for ν_e selection

⇔ identifying **e** vs **μ, γ, π, p**

how to detect uncharged particles (like ν) in a detector that can only detect charged ones?

→ by detecting the charged particle from ν interaction* in the detector:

*called Charged Current (CC) interaction

Why we need to improve the ν_e selection

Selection of a particle =

Particle **ID**entification

- 1) Define a **PID** method to identify your particle (**e**)

Using simulations of particle:

- 2) count how many true **e** are selected by the method
- 3) count how many *other particles* are selected by the method

This allows to define:

- **efficiency** = how much true **e** we selected
- **purity** = how much background is kept in the selected particles

Important! goes into the T2K uncertainties
→ need method which gives best eff & pur

Why we need to improve the ν_e selection

Particle Identification

Selection of a particle =

- 1) Define a **PID** method to identify your particle (**e**)

Using simulations of particle:

- 2) count how many true **e** are selected by the method
- 3) count how many *other particles* are selected by the method

This allows to define:

efficiency = 18.6%

purity = 68%

Why we need to improve the ν_e selection

with current method:

efficiency = 18.6%

purity = 68%

Why we need to improve the ν_e selection

with current method:

efficiency = 18.6%

purity = 68%

2 new PID methods with ML: Transformer & Variational Auto-Encoder

VAE: un-supervised ML

Training:

Test:

performs worse in controlled, labeled settings but
should be better to deals with real data variability

2 new PID methods with ML: Transformer & Variational Auto-Encoder

VAE: un-supervised ML

Training:

Test:

performs worse in controlled, labeled settings but
should be better to deals with real data variability

Transformer: supervised ML

Training & test:

performs well in controlled, labeled settings but will
probably struggle more with real data variability

The Transformer PID method

What is a Transformer

“**Transformer** = a new simple network architecture, based solely on attention mechanisms, dispensing with recurrence and convolutions”

Attention Is All You Need

Key ideas:

- **takes sequences as inputs**
- **attention mechanisms:** allows the model to focus on the most relevant parts of the input sequence when producing an output
- **multi-head attention:** attending to different parts of the input in parallel allows for the model to capture multiple types of relationship
- **parallelizable architecture**

standard BERT architecture

The Transformer PID method

How we can apply it for the ν_e selection

The Transformer PID method

How we can apply it for the ν_e selection

The Transformer PID method

How we can apply it for the ν_e selection

The Transformer PID method

Vision Transformer

- Problem: some sequences of hits are **too long**:

- ⇒ not computationally efficient as complexity of transformer
 $\sim O(\text{sequence length}^2)$

- ⇒ training would take too long

- Solution: use the principle behind **vision transformers**

The Transformer PID method

Vision Transformer

⇒ not computationally efficient as complexity of transformer $\sim O(\text{sequence length}^2)$

⇒ training would take too long

- Solution: use the principle behind **vision transformers**

The Transformer PID method

Vision Transformer

Before :

The Transformer PID method

Vision Transformer

Before :

Now (ViT) :

e.g: create parent cubes of size 8x8x8

each parent cube holds the information of its child voxels: relative positions & charge

positional encoding of the parent cubes in the parent grid

The Transformer PID method

First performances

model trained for e/γ separation

model trained for $e/\gamma/\mu/\pi/p$ separation

The Transformer PID method

First performances

model trained for e/γ separation

The Transformer PID method

First performances

model trained for $e/\gamma/\mu/\pi/p$ separation

A glanced at the Variational Auto-Encoder method

Key idea: anomaly detection to distinguish e^- (anomalies) out of γ (trained on)

- 1 Train the VAE with many gamma conversion in the SFGD: it will learn to reconstruct the gamma events
- 2 Test it on e^- events: the reconstruction should not be as good $\rightarrow$ anomaly in the loss function

A glanced at the Variational Auto-Encoder method

2 distinction metrics
to analyse

Key idea: anomaly detection to distinguish e- (anomalies) out of γ (trained on)

- 1 Train the VAE with many gamma conversion in the SFGD: it will learn to reconstruct the gamma events
- 2 Test it on e- events: the reconstruction should not be as good $\rightarrow$ anomaly in the loss function

Separation of e and γ

latent space: dimensionality reduction with UMAP

z-distrib for **one event**:
vector of size (1,1024)

→ reduce it to (1,2)
using **UMAP**
(dimensionality
reduction algo)

→ plot all tested event
on this 2D map

Separation of e and γ

separation in the 2D latent space for electron selection

- 1) compute the **contamination** of each point
- 2) low-contamination points are fed into a **SVC with an RBF kernel**
- 3) the SVC creates a **delimitation in this 2D space**
- 4) **efficiencies and purities** using the electron/gamma regions can be computed:

e- efficiency: 98.73%

e- purity: 97.91%

γ efficiency: 97.89%

γ purity: 98.72%

BUT: this 2D umap was *transformed* on the same sample used for *fitting* the 2D umap: those eff,pur are only **upper limits**

Summary

- It's necessary to **characterize precisely the ν_e background** at the near detector
- New **methods are being developed** for this matter: a **Transformer** and a **VAE**
- The developpement of the **Transformer in the T2K analysis software** is done!
(first complex ML algo to be implemented there)
- The **Transformer** training shows **promising PID results**: other improvements are needed
- Some **VAE upgrades are on-going**, then new analyses are too come

Next steps:

- compare those 2 methods with the old ones on the same samples
- control sample
