

# Improvements on identification of $\tau$ lepton

Romain MADAR<sup>a</sup>

<sup>a</sup>Service de Physique des Particules  
CEA Saclay, Irfu/SPP - France

**DØ France** – 3<sup>th</sup> of May 2010 –

# Overview

## 1 $\tau$ lepton at $D\emptyset$

- The  $\tau$  lepton and its reconstruction
- Current identification

## 2 Identification improvements

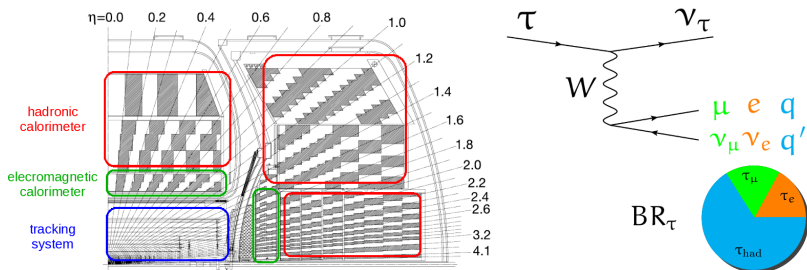

- New discriminating observables
  - Central Preshower
  - b-tagging tools
- Multivariate analysis optimization
  - Tuning of NN parameters
  - Dedicated training at high  $p_T$
  - Dedicated training in the ICD

## 3 Test in data

## 4 Conclusions and outlooks

# The $\tau$ lepton and its reconstruction

**Physical properties :**  $m_\tau = 1.78 \text{ GeV}$ ,  $c\tau_{\text{life}} = 87 \text{ }\mu\text{m}$

We will focus on **hadronic decay** of  $\tau$  :  $\tau_{\text{had}}$

**Reconstruction and  $\tau$  type definition for hadronic decay :**

- type 1  $\equiv$  1 **trk**, **HAD** deposit  $\sim \tau^\pm \rightarrow \pi^\pm \nu_\tau$
- type 2  $\equiv$  1 **trk**, **EM** and **HAD** deposit  $\sim \tau^\pm \rightarrow \rho^\pm (\rightarrow \pi^0 \pi^\pm) \nu_\tau$
- type 3  $\equiv$  at least 2 **trks**, **HAD** deposit  $\sim \tau^\pm \rightarrow a_1^\pm (\rightarrow \pi^\pm \pi^\mp \pi^\pm) \nu_\tau$

# Identification of true $\tau$

$\tau_{\text{had}} \approx$  narrower jet with lower track multiplicities

Jets could have the same experimental signatures as hadronic  $\tau$  and need to be removed.

# Identification of true $\tau$

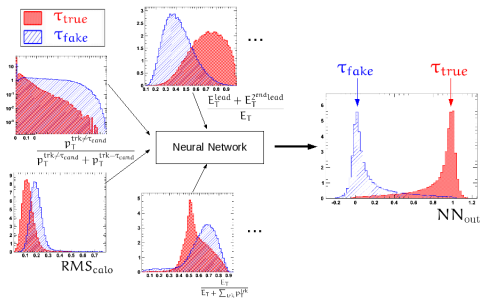

$\tau_{had} \approx$  narrower jet with lower track multiplicities

Jets could have the same experimental signatures as hadronic  $\tau$  and need to be removed.

## ~ 12 discriminating observables

- track isolation,
- calo isolation,
- shower shape,
- trk-calo correlations.

# Overview

## 1 $\tau$ lepton at $D\emptyset$

- The  $\tau$  lepton and its reconstruction
- Current identification

## 2 Identification improvements

- New discriminating observables
  - Central Preshower
  - b-tagging tools
- Multivariate analysis optimization
  - Tuning of NN parameters
  - Dedicated training at high  $p_T$
  - Dedicated training in the ICD

## 3 Test in data

## 4 Conclusions and outlooks

## Improvement strategy

**General point of view :** Neural Networks output  $\eta^{\text{NN}}(\vec{X})$  converges to

$$\eta^{\text{true}}(\vec{X}) \equiv \frac{\mathcal{S}(\vec{X})}{\mathcal{S}(\vec{X}) + \mathcal{B}(\vec{X})}$$

where  $\vec{X} \equiv (x_1, x_2, \dots, x_n)$  describes the discriminating variables space.

**In the  $\tau$ ID context :**

A lot of ideas were tested to improve the current identification of  $\tau$  :

- Include the Central preshower (2 approaches) ✗
  - Exploit the long  $\tau$  life time (using b-tagging tools) ✓
  - Tune NN parameters (epoch, nodes, statistics) ✓
  - Dedicated training for  $\tau$  of high  $p_T$  ✓
  - Dedicated training for high luminosity events ✗
  - Dedicated training in ICD (for type 1) ✓
- } improve  $\eta^{\text{true}}(\vec{X})$
- } minimize  $|\eta^{\text{NN}} - \eta^{\text{true}}|$

# Overview

## 1 $\tau$ lepton at DØ

- The  $\tau$  lepton and its reconstruction
- Current identification

## 2 Identification improvements

- New discriminating observables
  - Central Preshower
  - b-tagging tools
- Multivariate analysis optimization
  - Tuning of NN parameters
  - Dedicated training at high  $p_T$
  - Dedicated training in the ICD

## 3 Test in data

## 4 Conclusions and outlooks

## Central PreShower (CPS) for type 2

**Physical idea.** Exploit specific resonance of  $\tau$  **type 2** decay :  $\tau^\pm \rightarrow \rho^\pm \nu \rightarrow \pi^\pm \pi^0 \nu$ .  
Use Central PreShower detector with fine segmentation :  $\Delta\phi_{\text{CPS}} \simeq 0.1 \times \Delta\phi_{\text{calo}}$

$$\text{CPS}_{\text{cluster}} \approx \pi^0, \text{trk} \approx \pi^\pm$$

# Central PreShower (CPS) for type 2

**Physical idea.** Exploit specific resonance of  $\tau$  **type 2** decay :  $\tau^\pm \rightarrow \rho^\pm \nu \rightarrow \pi^\pm \pi^0 \nu$ .  
Use Central PreShower detector with fine segmentation :  $\Delta\phi_{\text{CPS}} \simeq 0.1 \times \Delta\phi_{\text{calo}}$

$$\text{CPS}_{\text{cluster}} \approx \pi^0, \text{trk} \approx \pi^\pm$$

No significant improvement

# $\tau$ is a long lived particle

Use impact parameter to remove  
jets faking  $\tau$  more efficiently.  
(large  $c\tau_{\text{life}} \Rightarrow$  large  $d_0$ )

# $\tau$ is a long lived particle

Use impact parameter to remove jets faking  $\tau$  more efficiently.  
(large  $c\tau_{\text{life}} \Rightarrow$  large  $d_0$ )

# $\tau$ is a long lived particle

Use impact parameter to remove jets faking  $\tau$  more efficiently.  
(large  $c\tau_{\text{life}} \Rightarrow$  large  $d_0$ )

Clear improvement in performance !

# Overview

## 1 $\tau$ lepton at $D\bar{D}$

- The  $\tau$  lepton and its reconstruction
- Current identification

## 2 Identification improvements

- New discriminating observables
  - Central Preshower
  - b-tagging tools
- Multivariate analysis optimization
  - Tuning of NN parameters
  - Dedicated training at high  $p_T$
  - Dedicated training in the ICD

## 3 Test in data

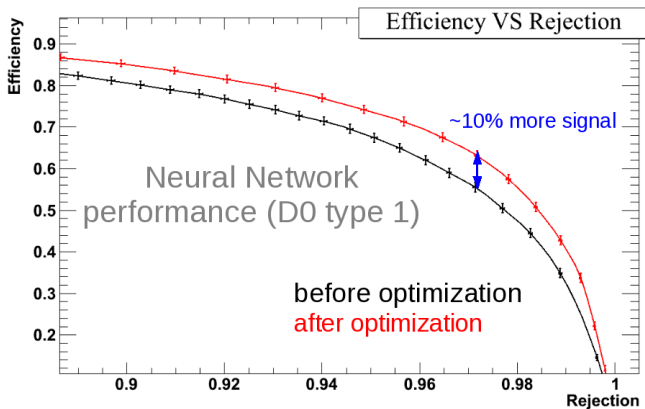

## 4 Conclusions and outlooks

# Fine tuning of NN parameters

$$\Delta\epsilon \equiv \epsilon_{\text{new}} - \epsilon_{\text{off}} \text{ at } 97.0\% \text{ rejection}$$

# Fine tuning of NN parameters

# Overview

## 1 $\tau$ lepton at $D\emptyset$

- The  $\tau$  lepton and its reconstruction
- Current identification

## 2 Identification improvements

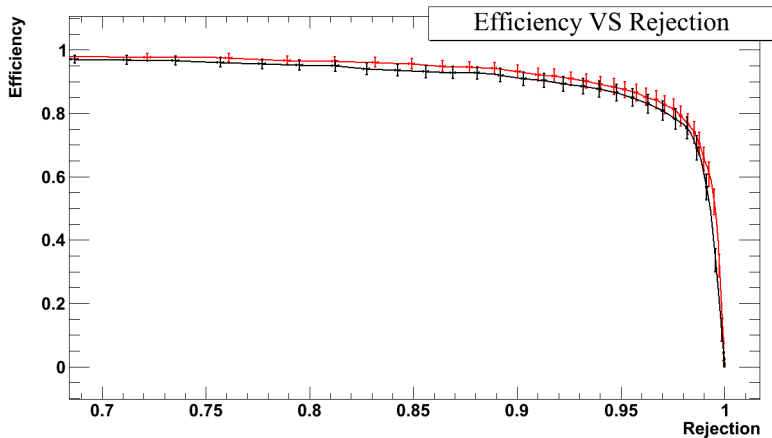

- New discriminating observables
  - Central Preshower

  - Dedicated training in the ICD

## 3 Test in data

## 4 Conclusions and outlooks

## Effect of dedicted training in ICD (type 1)

**In ICD :**

no EM cluster  $\Rightarrow$  physical type 2 are reconstructed as type 1

# Overview

## 1 $\tau$ lepton at DØ

- The  $\tau$  lepton and its reconstruction
- Current identification

## 2 Identification improvements

- New discriminating observables
  - Central Preshower
  - b-tagging tools
- Multivariate analysis optimization
  - Tuning of NN parameters
  - Dedicated training at high  $p_T$
  - Dedicated training in the ICD

## 3 Test in data

## 4 Conclusions and outlooks

# Test in data

**Background estimation** : from an isolated muon (OS/SS method used in  $\phi \rightarrow \tau\tau$  analysis)

New NN, Old NN

$\eta_d(\tau)$  distribution after cut on New NN

$\eta_d(\tau)$  distribution after cut on Old NN

S/B VS  $p_T$  for all type**Comments :**

Important improvement at high  $p_T$ , but really good improvement also at low  $p_T$ !

# Overview

  - Dedicated training in the ICD

## 3 Test in data

## 4 Conclusions and outlooks

## Conclusions & outlooks

### Results for the $\tau$ identifications : $\sim 10\%$ of improvements

- Include the Central preshower (2 approaches) ✗
- Exploit the long  $\tau$  life time (using b-tagging tools) ✓
- Tune NN parameters (epoch, nodes, statistics) ✓
- Dedicated training for  $\tau$  of high  $p_T$  ✓
- Dedicated training for high luminosity events ✗
- Dedicated training in ICD (for type 1) ✓

---

### Practical comments :

- Available at **cafe** level : some changes in the  $\tau$  processor/config file described in calgo and conveners meetings)
- DØ note already started

# BACKUP SLIDES

$E_\tau$  calibration : “E/p correction”

## Known effect

The **calorimeter response** is slightly different in the simulation and in data.

$\tau_{\text{measured}} \equiv \{\gamma, \pi^\pm\}$  energy **needs a relative correction.**

## Correction method

Use the **track energy as reference** to correct simulation event by event :

$$\left(\frac{E}{p}\right)_{\text{MCcorr}} = \left(\frac{E}{p}\right)_{\text{MC}} \times \frac{\langle E/p \rangle_{\text{data}[Z \rightarrow \tau\tau]}}{\langle E/p \rangle_{\text{MC}}}$$

with

- $E/p \equiv E^{\text{calo}}/p^{\text{trk}}$
- $\langle E/p \rangle \equiv$  average value.

## Why a dedicated training for type 1 ?

S/B VS  $p_T$  type 1

S/B VS  $p_T$  type 2

# S/B VS $p_T$ type 3

# MSSM charged Higgs

## Charged higgs bosons via $t\bar{t}$ events
