

# Purification of Beams with MR-TOF-MS at IGISOL

Brian Kootte for the  
ACCLAIM MORA Kick-off meeting 2025

# Overview

- General and specific motivation for isobaric purification
- Principle of isobar purification with MR-TOF-MS
- Results of the separation achieved in  $^{23}\text{Mg}$  run
- Caveats for implementing the technique

# Isobars

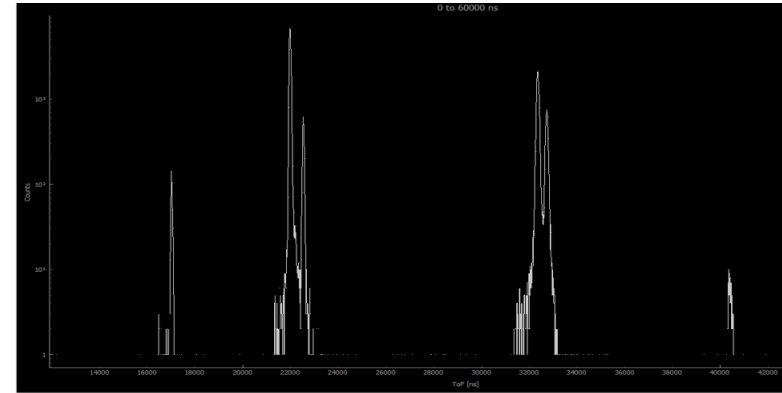

- IGISOL dipole magnet (mostly) selects one mass-to-charge ratio
- Isobars include anything with same  $A/q$ 
  - $A_{\text{contaminant}} = A_{\text{ion of interest}}$
  - Molecules (oxide, hydride, etc.)
  - 2+ ions with  $A_{\text{contaminant}} = 2 \times A_{\text{ion of interest}}$

# TOF Separation of Different Mass Units (A)

Mini-buncher  
extraction

$$TOF \propto \sqrt{A/q}$$

Magnetof  
Detector

(MR-TOF-MS)

# Trapping in MR-TOF-MS

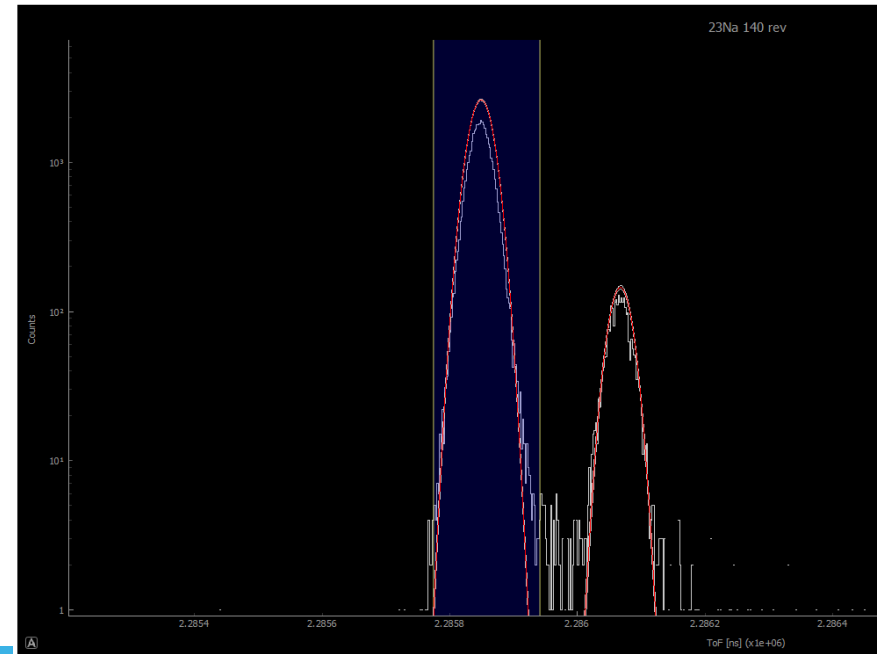

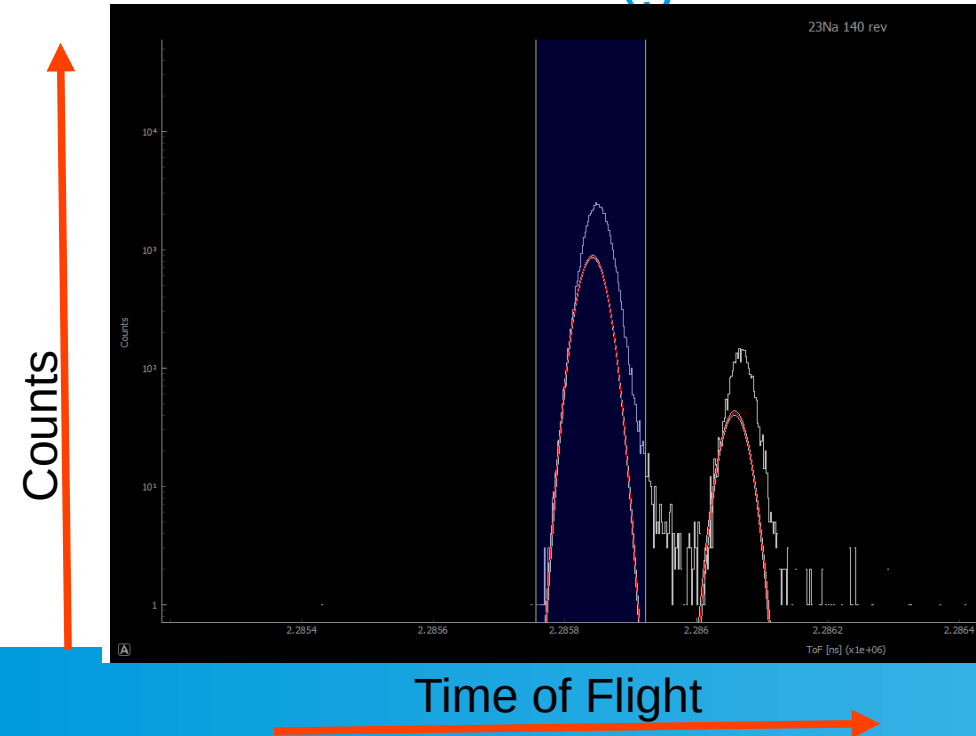

# Separation of Isobars

# Optimizing $^{23}\text{Mg}/^{23}\text{Na}$ Ratio

- Instant feedback from MR-TOF-MS
- Proton beam steering optimized
- 200 revolutions (good balance)

# Separation of Isobars

# Increasing Mg Purity with Lift Timing

# Purified Mg on MORA MCP1

$^{23}\text{Na}$  and  $^{23}\text{Mg}$  after 200 rev with low intensity beam on MCP1

Possibly purified Mg after adjusting in-trap lift timing

# Caveat: High Intensity of Ions

- Distorted spectrum
- ~0.7% trap efficiency

# Caveat: High Intensity of Ions

~3000  
ions  
per  
bunch

Peak  
develops  
“wings”

Three peak structure at 200 rev with high beam intensity (Na + Mg)

# Indication of an Energy-dependence

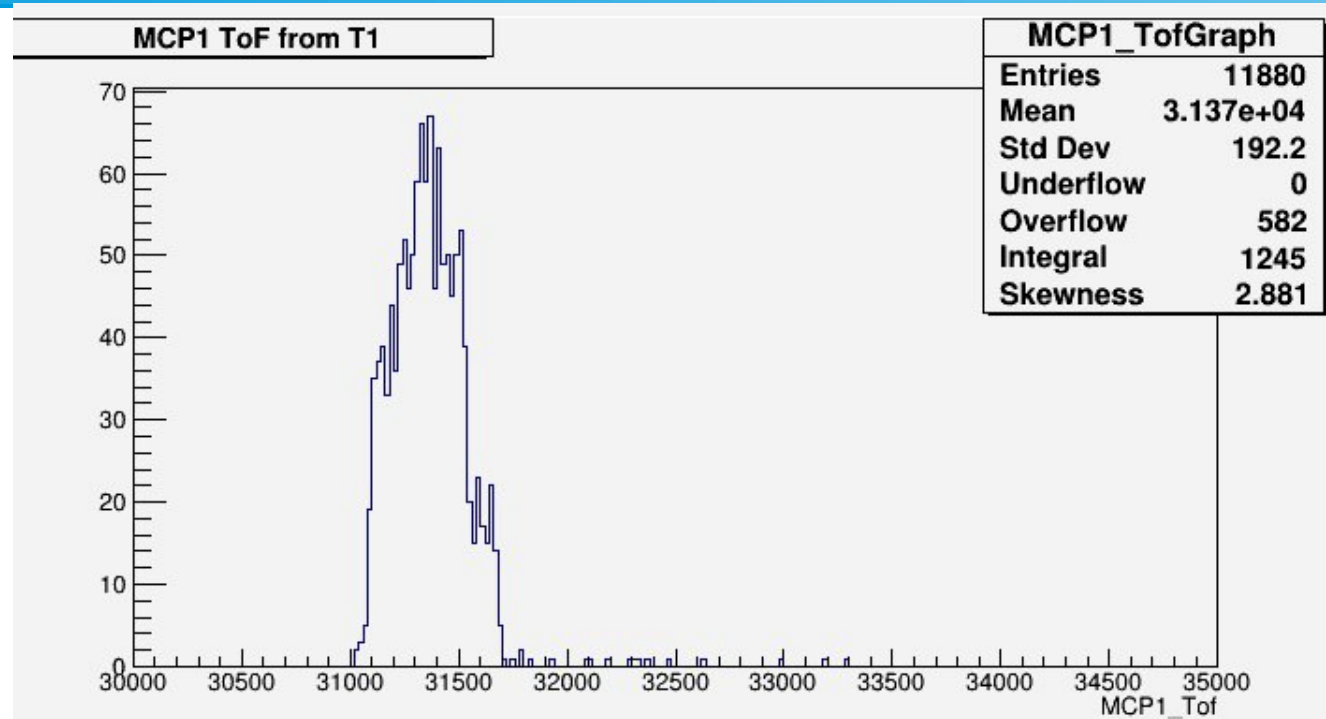

Ions appear to  
separate by energy  
after trapping in  
MR-TOF-MS

A retarding voltage before the MCP blocks the lowest-energy ions

# Indication of an Energy-dependence

Ions appear to  
separate by energy  
after trapping in  
MR-TOF-MS

Even higher blocking potential

# Considerations for Many Ions per Bunch

- Large space-charge changes the starting potential of the ions
- So the in-trap lift voltage needs to change for an approximately energy-independent time-focus
- Changing the in-trap lift also shifts the total TOF to MORA

# Kiitos/Merci

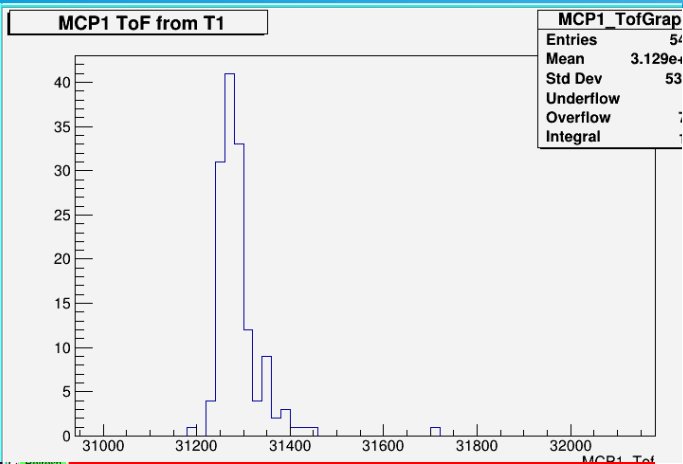

# PISA Source Allows Mini-buncher tuning

# $^{23}\text{Mg}/^{23}\text{Na}$ Ratio Optimization

10 ms beam gate
