

Interfaces between Production and Research Grids

Frédéric Suter

Conseil Scientifique de l'Institut des Grilles
1er Juin 2010

Outline

- Research Grids vs. Production Grids
 - Objectives
 - Types of jobs
 - Job Life Cycle
 - Load
 - Resource Sharing
 - Behavior
 - Administration Constraints
- Research Grids and Production Grids
 - The Interface Program
 - Possible Collaboration Points

Different Objectives

Production Grids

- ▶ Goal: Feasibility
- ▶ Means: Toolboxes
- ▶ Keyword: Transparency
- ▶ Example: EGEE/EGI
- ▶ Execute the applications of today

Research on Grids

- ▶ Goal: Performance
- ▶ Means: Algorithms
- ▶ Keyword: Control
- ▶ Example: Grid'5000
- ▶ Prepare the environments of tomorrow

Different Types of Jobs

Production Grids

- ▶ Driven by LHC and High Energy Physic
- ▶ A vast majority of 1-CPU jobs
- ▶ 100% on the AuverGrid trace¹
- ▶ Longer jobs (> 7h on average)

Grid'5000

- ▶ Driven by the HPC community
- ▶ Many parallel jobs
- ▶ 53/46 on the Grid'5000 trace²
- ▶ Shorter jobs (< 1h on average)

¹<http://gwa.ewi.tudelft.nl/pmwiki/pmwiki.php?n=Workloads.Gwa-t-4>

²<http://gwa.ewi.tudelft.nl/pmwiki/pmwiki.php?n=Workloads.Gwa-t-2>

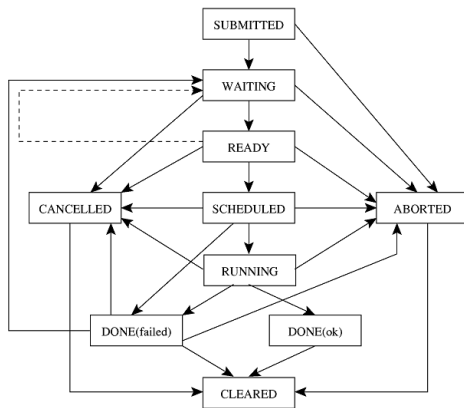

Different Job Life Cycles

Grid'5000 for a 1-proc job

- ▶ Look at Monika or the Gantt chart
- ▶ Select one site that has at least one node available
- ▶ Go there (maybe with my data)
- ▶ call oarsub (maybe with -I)
- ▶ get my machine quite immediatly
- ▶ Deploy my environment
- ▶ run my application
- ▶ Get the results or fail

Different Job Life Cycles

On Production Grids (EGEE)

- ▶ Before submission, have to specify the requirements (in JSDL for instance)
- ▶ No deployment, have to find a suitable node
- ▶ The waiting state can be neglected

Different Loads

Grid'5000

- ▶ Not heavily loaded
 - ▶ by design, dimensionning experiments can still run
- ▶ Always some nodes available
- ▶ Jobs can wait (for hours) if
 - ▶ They require many cores
 - ▶ They asked for a specific (and demanded) resource
 - ▶ There is a big conference deadline

Production Grids

- ▶ Always overloaded!
- ▶ Example of the IN2P3 Computing Center
 - ▶ 10 jobs for 8 CPUs
 - ▶ CPUs at full speed 80% of the time
 - ▶ Inactivity only due to data staging
 - ▶ 8,000 jobs running and 16,000 jobs waiting (for days) in queue

Different Resource Sharing

Grid'5000

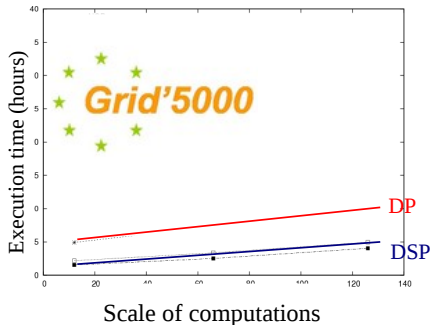

- ▶ Once you get an account and have signed the charter
- ▶ Do what you want (with respect to the charter)
- ▶ Your behavior is traced by Kaspied

Production Grids

- ▶ Rely on VOs (Virtual Organizations)
- ▶ You can only access to resources where your VO is allowed
- ▶ Sharing among VOs is decided beforehand
- ▶ At a computing center level
 - ▶ Applications make resource requests each year
 - ▶ Consensus has to be found

Different behaviors

- **Performance comparison across platform**
 - Same (workflow-based) application running on reserved resources (G5K) and in production (EGEE)
 - Two parallelization modes (DP and DSP)

Different Administration Constraints

Grid'5000

- ▶ Users can deploy their own image
 - ▶ Admins “only” have to maintain the default image
- ▶ Three critical services: OAR, Kadeploy, and Kvlan

Production Grid

- ▶ No virtualization (yet)
- ▶ Admins have to maintain
 - ▶ Operating System(s)
 - ▶ Libraries
 - ▶ Middleware stack
 - ▶ Licensed software
- ▶ Upgrade is a long process
 - ▶ 1 year to move from SL4 to SL5 at CC IN2P3
 - ▶ 2 or 3 concurrent versions of the OS
 - ▶ Scientifics often keep the sources, compiler and even binary
 - ▶ To ensure data processing under similar conditions sometimes years after

Conclusion

Grid'5000 is not a (production) Grid

- ▶ It's an scientific instrument
- ▶ Going to a production mode is not trivial
- ▶ Because the focus are different
 - ▶ Grid'5000: Controlled environment, you know everything
 - ▶ Production Grid: execution platform, (almost) everything is hidden

Outline

- Research Grids vs. Production Grids
- Research Grids and Production Grids
 - The Interface Program
 - Possible Collaboration Points

Interfaces

Making connections

- ▶ One of the missions of the Institut des Grilles
- ▶ In cooperation with Aladdin/Grid'5000
- ▶ In both directions
 - ▶ Research → Production
 - ▶ Production → Research

First call to proposal in 2009

- ▶ Supported by C. Germain-Renaud and F. Desprez
- ▶ Total funding: 20,000 euros (10 from IdG, 10 from Aladdin)
- ▶ Lightweight procedure: scientific program on 3 pages
- ▶ Objective: establish consortiums and submit bigger proposals
- ▶ Selection ratio: 7/9

Selected Projects

- ▶ SimGLite, when SimGrid meets gLite
 - ▶ F. Suter – CC IN2P3
 - ▶ 5,000 euros
- ▶ Simulating Data-Intensive Applications
 - ▶ M. Quinson – LORIA/Nancy University
 - ▶ 5,000 euros
- ▶ Efficacité énergétique dans les grilles: de la recherche à la production
 - ▶ L. Lefevre – INRIA, LIP, ENS Lyon
 - ▶ 4,000 euros
- ▶ XWHEP : une grille de calcul globale securisee et interconnectee à EGEE
 - ▶ O. Lodygensky – LAL
 - ▶ 2,000 euros
- ▶ Criblage Virtuel de Semences
 - ▶ G. Da Costa – Uni. Toulouse
 - ▶ 2,000 euros
- ▶ Modélisations, Simulations et Calculs Hautes Performances pour l'énergie solaire
 - ▶ M. Daumas – ELIAUS
 - ▶ 1,000 euros
- ▶ Calcul à hautes performances sur processeurs GPU pour la biologie intégrative
 - ▶ D. Hill - Univ. Clermont
 - ▶ 1,000 euros

Next call in 2010

What is unchanged

- ▶ Lightweight procedure
- ▶ Calendar (at fall)
- ▶ Number of selected project (less than 10)

Some new propositions

- ▶ Fund a Master internship
- ▶ Setup a collaboration forum
 - ▶ As for European projects
 - ▶ Researchers can propose some ideas
 - ▶ Production can submit some problems

What Research Can Bring?

- ▶ A new middleware
- ▶ A better TCP protocol
- ▶ A High-Performance MPI
- ▶ An OS deployment solution
- ▶ A new programming paradigm
- ▶ A task scheduling algorithm
- ▶ Virtualization
- ▶ Energy savings
- ▶ A platform simulator
- ▶ A trustful emulator

What Production May Answer?

- ▶ A new middleware. Not if I have to rewrite all my codes
- ▶ A better TCP protocol. Get it integrated in Scientific Linux first
- ▶ A High-Performance MPI. Will it help my sequential jobs?
- ▶ An OS deployment solution. I may deploy twice a year at most
- ▶ A new programming paradigm. Fortran is just fine
- ▶ A task scheduling algorithm. Round robin works well for my workload
- ▶ Virtualization. only if it adds flexibility and reliability
- ▶ Energy savings. to compute more for less, but no resource shut down
- ▶ A platform simulator. I care only for my results, not how they were obtained
- ▶ A trustful emulator. Why would I slowdown my machines?

What Production Does Expect?

- ▶ Reliability, Reliability, Reliability
- ▶ Transparency, Transparency, Transparency
- ▶ Recovering gracefully of a failure
 - ▶ Better than trying to prevent it
- ▶ Improving an existing tool should be better perceived.
- ▶ Hot Topics
 - ▶ Large databases.
 - ▶ Virtualization (for administration comfort)
 - ▶ Interoperability
 - ▶ Production grids start to connect each other
 - ▶ Mastering the energy consumption
 - ▶ Preventing the anticipated crash into the memory wall
 - ▶ Memory does not grow linearly with the number of cores
 - ▶ This will become a problem for 1-proc jobs

What Production Can Bring?

- ▶ Realism!
- ▶ Real Applications (some with large societal impact)
- ▶ Real users, with concrete needs and expects
- ▶ Different use cases
 - ▶ Often harder than the comfortable ones we use in research
- ▶ A way to promote research results

Final Word

Research and production communities have to work hand by hand even though they look in opposite directions
