

FJPPL Report 2025

Fiscal year April 1st 2025 – March 31th 2026

Please replace the red examples by the appropriate data in black

<p>Summary of 2025 Activities</p>	<p>In 2025 we continued our very successful joint France-Japan project with the main goal of improving our knowledge on the upgraded (anti)neutrino beam produced at J-PARC for T2K-II and HyperKamiokande (HK) experiments. After the important J-PARC neutrino beamline upgrade, it now operates regularly achieving the record beam power of 900 kW. Moreover, operation with a horn current set at 320 kA (instead of 250 kA used previously) is now well established. In 2025, the physics data taking using upgraded beamline and neutrino detectors was successfully performed.</p> <p>The measurements of hadron yields from the surface of the T2K target performed with the upgraded NA61/SHINE spectrometer at the CERN SPS are crucial for detailed characterization of the J-PARC neutrino beam and already allowed to achieve unprecedented precision on flux uncertainties. New data (180 M triggers compared to 10 M used previously) collected during the 2022 are being thoroughly calibrated and analyzed by a joint team of Japanese and French physicists. In 2025 the first round of calibration was finalized and the first preliminary analysis was performed in order to measure the yields of neutral kaons. These results, included in the PhD thesis by Sakiko Nishimori, together with future measurements of charged kaon yields are crucial for further reduction of neutrino flux uncertainties in T2K and HK.</p> <p>In 2025 we started the production and deployment of the new time synchronization system being developed for the J-PARC neutrino beam by the joint French-Japanese team. Some stability tests were performed on the J-PARC site using the already installed equipment. A free-running Rubidium atomic clock accompanied by a set of GNSS antenna and receiver installed at J-PARC are being characterized. Additionally, during T2K experiment data taking, we are conducting measurement tests using the new time synchronization system to evaluate its measurement stability and other functions. A correction method was developed to precisely synchronize a time base generated from a free-running atomic clock with the Coordinated Universal Time (UTC) using signals from a GNSS antenna and receiver.</p> <p>In 2025, new results on the updated HK sensitivity studies to the neutrino oscillation parameters using the neutrino beam from the J-PARC accelerator were obtained and published. One of the main analyzers was Claire Dalmazzone (LPNHE) who successfully defended her PhD thesis in September, 2025.</p>
<p>Workshop / satellite session at annual workshop</p>	<p>The group meets regularly on the occasion of NA61/SHINE, T2K and HK collaboration meetings. We also organize dedicated Zoom meetings in order to discuss the ongoing activities and to define plans for the future. In-person workshops are also being scheduled, if needed.</p>
