# Three Goals of my Talk:

**Strongly coupled dark sectors** provide well-motivated dark matter candidates with **rich phenomenology**.

Broad classes of **dark baryon dark matter** are weakly constrained by direct detection due to inherent **symmetries** of the dark sector.

**Dark mesons** provide a very promising target to probe these dark sectors.

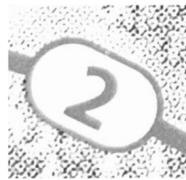

LHC signals include:

- **dissappearing track searches**
- **new resonances** (neutral, +, ++ ) arising from a newly identified anomaly

# A strongly-coupled dark sector

New  $SU(N)$  confining gauge sector with **vector-like fermions** transforming under (part of) the SM gauge group.

For this talk

Confinement scale:

$$\Lambda \sim 100 \text{ GeV} - 10 \text{ TeV}$$

( $> m_f$ , enabling chiral Lagrangian for dark pions)

Anomaly-free; fermion mass:

$$m_f (q r + h.c.)$$

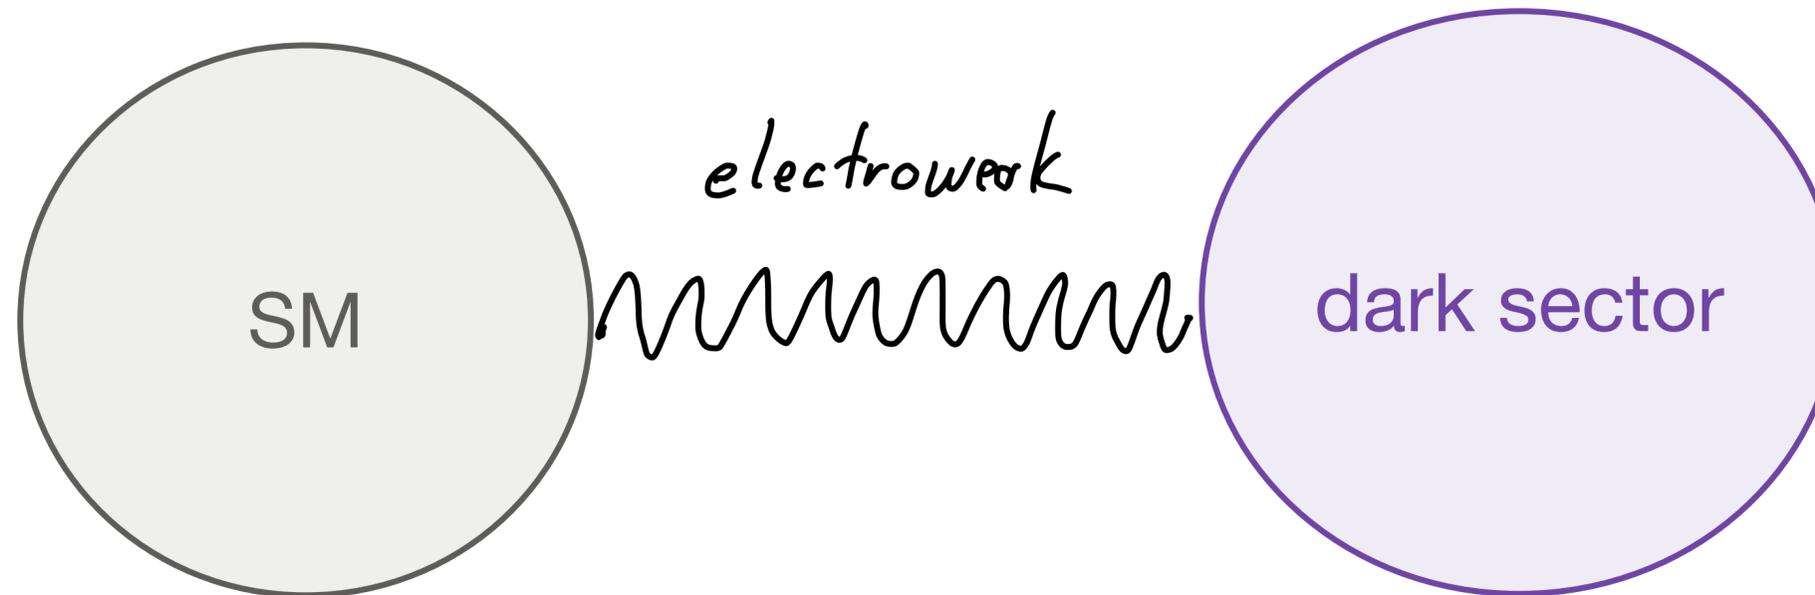

$$Q = \begin{pmatrix} q \\ r^+ \end{pmatrix}$$

$$m_f \bar{Q} Q$$

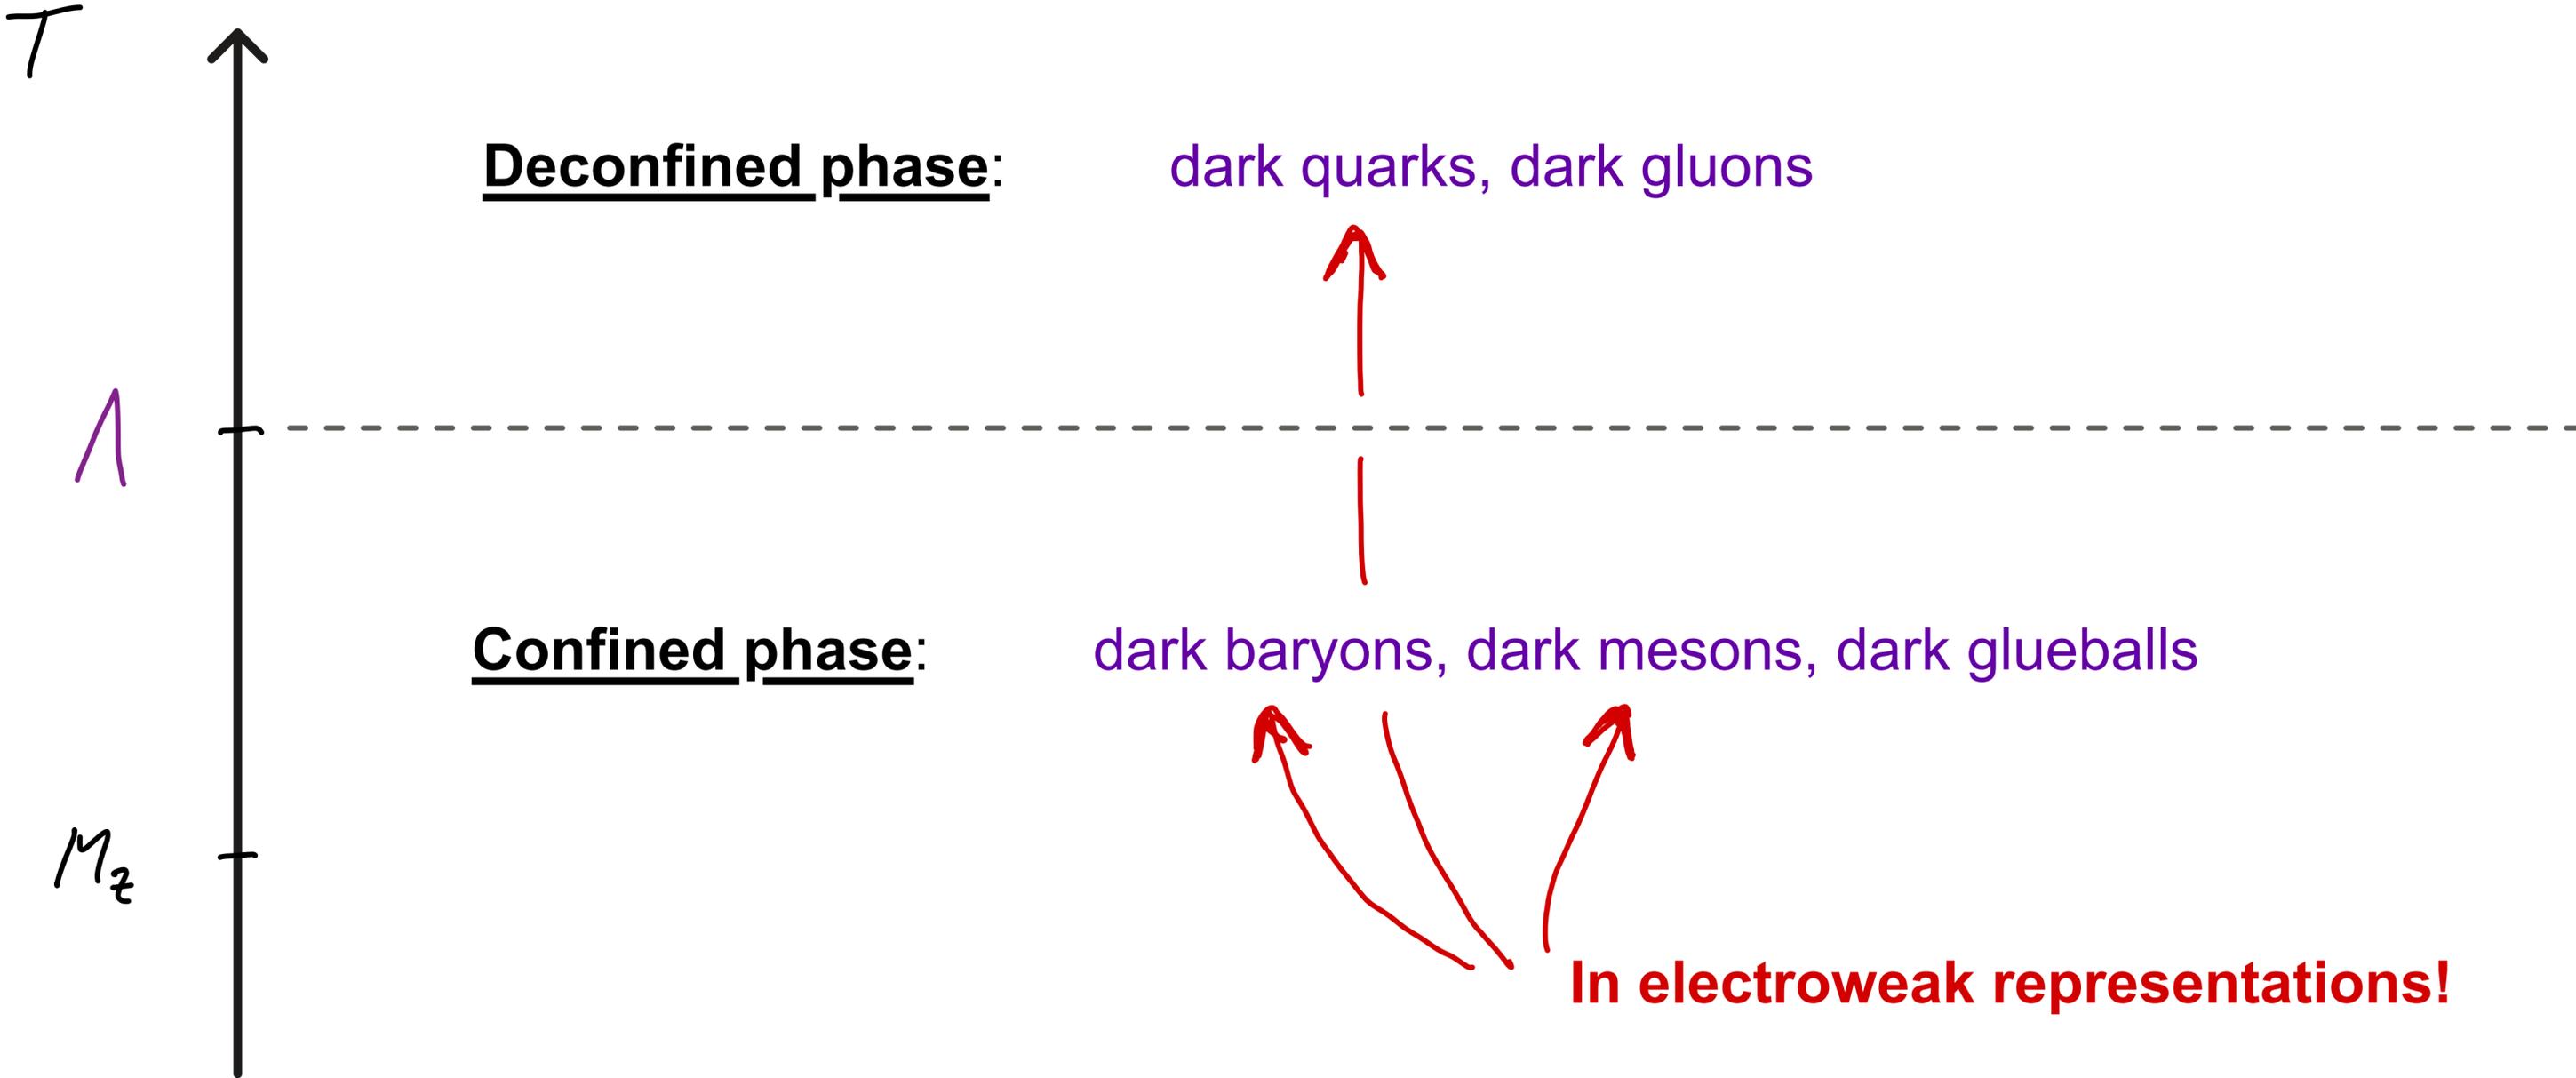

# Equilibration at high temperatures

$$T \gtrsim \Lambda$$

Provides a variety of possible **dark matter abundance** mechanisms ...  
(not the subject of this talk)

# Phases of this dark sector

Variety of cosmological implications...  
(also not the subject of this talk)

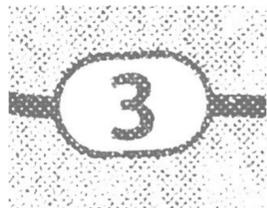

# Three Goals of my Talk:

Strongly coupled dark sectors provide well-motivated dark matter candidates with rich phenomenology.

Broad classes of **dark baryon dark matter** are weakly constrained by direct detection due to inherent **symmetries** of the dark sector.

Dark mesons provide a very promising target to probe these dark sectors.

LHC signals include:

- disappearing track searches
- new resonances (neutral, +, ++ ) arising from a newly identified anomaly

# Working Example: $SU(3)$ with $N_f=3$ flavors of dark quarks

## Dark Baryons

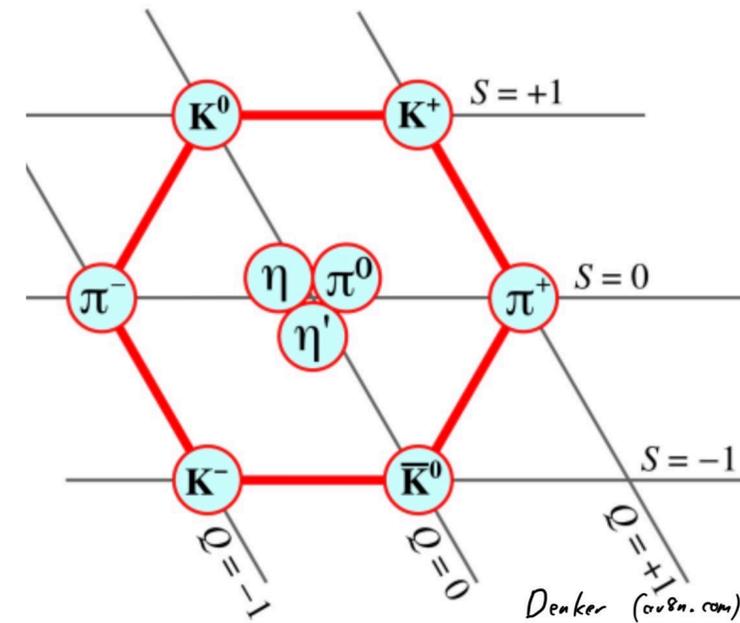

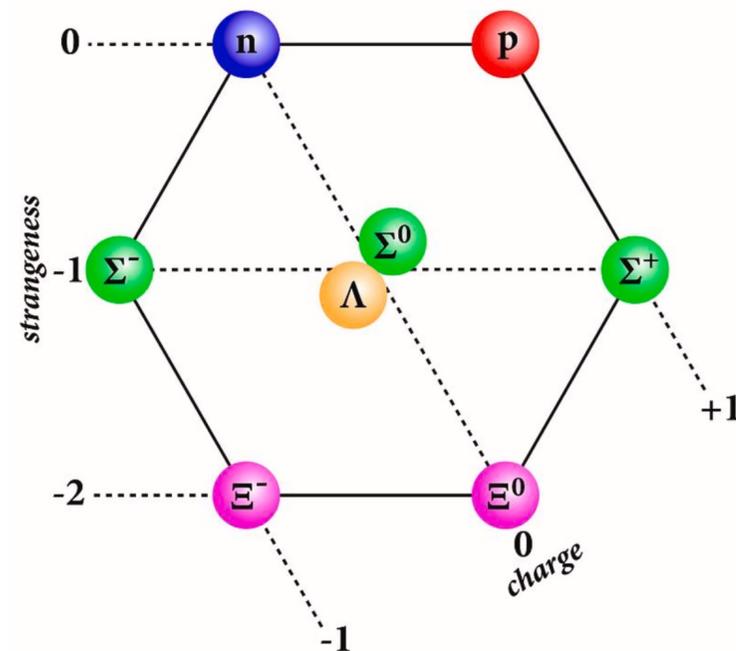

$$3 = \begin{pmatrix} \Sigma_1 \\ \Sigma_0 \\ \Sigma_{-1} \end{pmatrix} \quad 5 = \begin{pmatrix} \Lambda_{++} \\ \Lambda_+ \\ \Lambda_0 \\ \Lambda_- \\ \Lambda_{--} \end{pmatrix}$$

## Dark Mesons

$$N_f \otimes N_f = 1 \oplus 3 \oplus 5 \oplus \dots (2N_f - 1)$$

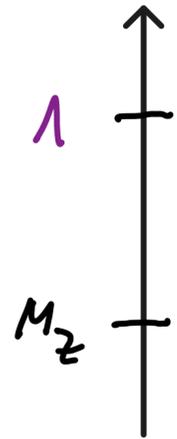

$\uparrow$   $\uparrow$   $\uparrow$   
 $\eta'$  ,  $\begin{pmatrix} \pi^+ \\ \pi^0 \\ \pi^- \end{pmatrix}$  ,  $\begin{pmatrix} \eta^{++} \\ \eta^+ \\ \eta^0 \\ \eta^- \\ \eta^{--} \end{pmatrix}$

analogous to QCD

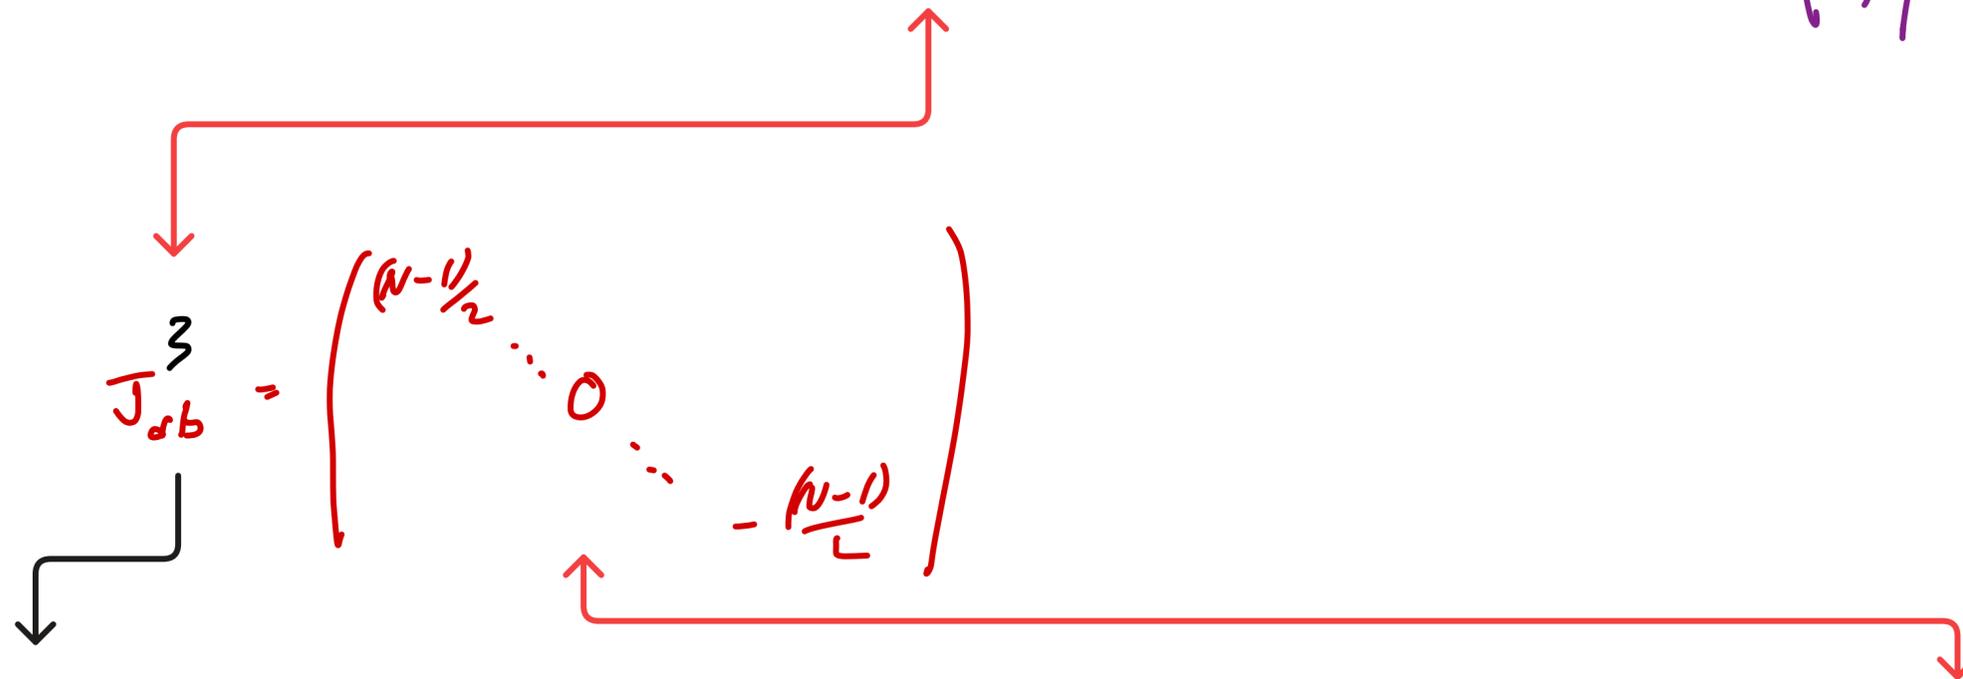

# Surprise #1: Dark Baryon Moments are Suppressed

Below confinement scale, generate electroweak operators for **dark baryons**:

$$\begin{array}{l}
 \frac{1}{\Lambda} \bar{\psi}_a \sigma^{\mu\nu} (\gamma^5) \psi_b J_{ab}^i F_{\mu\nu}^i \\
 \frac{1}{\Lambda^2} \bar{\psi}_a \gamma^\mu (\gamma^5) \psi_b J_{ab}^i \partial^\nu F_{\mu\nu}^i
 \end{array}
 \quad \psi_a = \begin{pmatrix} \vdots \\ \psi_+ \\ \psi_0 \\ \psi_- \\ \vdots \end{pmatrix}$$

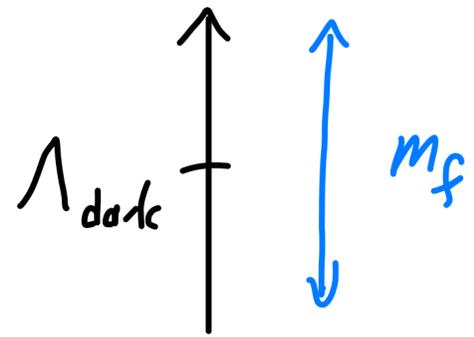

with group elements

The  $\bar{\psi}_0 - \psi_0 - W^3$  interaction **absent**. Neutral dark baryon magnetic/electric dipole moments and charge radius / anapole **vanish**.

# Dark Parities

Holds independent of  $N_c$ ,  $N_f$  and scale:

## G-parity

Bai, Hill 1005.0008

Rotate 2-component fermion fields by:

$$\begin{aligned} q_a &\rightarrow S_{ab} q_b \\ r_a &\rightarrow r_b S_{ba}^+ \end{aligned} \quad S = \exp[i\pi J^2]$$

Global rotation by SU(2)<sub>L</sub> generator

combine with charge conjugation of dark quarks:

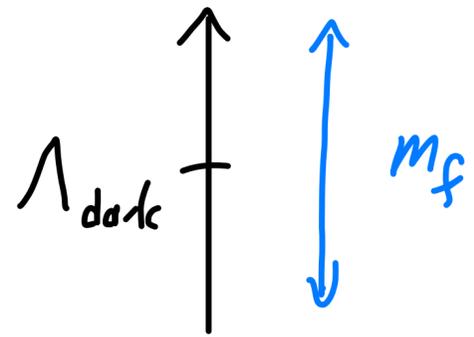

$$\begin{aligned} r &\rightarrow C r = q \\ q &\rightarrow C q = r \end{aligned}$$

Dark mesons transform under G:

$$\begin{aligned} 3\text{-plet, } 7\text{-plet, } \dots & \text{ G-odd} & (\pi &\rightarrow -\pi) \\ 1\text{-plet, } 5\text{-plet, } \dots & \text{ G-even} & (\eta' &\rightarrow +\eta') \end{aligned}$$

# Surprise #1.5: New Dark Parities

Holds independent of  $N_c$ ,  $N_f$  and scale:

G-parity

H-parity

Bai, Hill 1005.0008

Rotate 2-component fermion fields by:

Asadi, Mantel, GK 2410.23631

$$\begin{aligned} q_a &\rightarrow S_{ab} q_b \\ r_a &\rightarrow r_b S_{ba}^+ \end{aligned}$$

$$S = \exp[i\pi J^2]$$

Global rotation by SU(2)<sub>L</sub> generator

combine with charge conjugation of dark quarks:

$$\begin{aligned} r &\rightarrow C r = q \\ q &\rightarrow C q = r \end{aligned}$$

Dark mesons transform under G:

$$\begin{aligned} 3\text{-plet, } 7\text{-plet, } \dots & \text{ G-odd} & (\pi &\rightarrow -\pi) \\ 1\text{-plet, } 5\text{-plet, } \dots & \text{ G-even} & (\eta' &\rightarrow +\eta') \end{aligned}$$

combine with charge conjugation of EW gauge fields:

$$\begin{aligned} W_\mu^a &\rightarrow (W_\mu^a)^c = \begin{cases} +W_\mu^2 \\ -W_\mu^{1,3} \end{cases} \\ B_\mu &\rightarrow (B_\mu)^c = -B_\mu \end{aligned}$$

Lagrangian also invariant.

# H-parity transformations of dark baryons

$$\mathcal{S} \begin{pmatrix} \Sigma_1 \\ \Sigma_0 \\ \Sigma_{-1} \end{pmatrix} = \begin{pmatrix} +\Sigma_1 \\ -\Sigma_0 \\ +\Sigma_{-1} \end{pmatrix}$$

$$\mathcal{S} \begin{pmatrix} \Lambda_{++} \\ \Lambda_+ \\ \Lambda_0 \\ \Lambda_- \\ \Lambda_{--} \end{pmatrix} = \begin{pmatrix} +\Lambda_{++} \\ -\Lambda_+ \\ +\Lambda_0 \\ -\Lambda_- \\ +\Lambda_{--} \end{pmatrix}$$

e.g.  $\bar{\Sigma}_0 \sigma^{\mu\nu} \Sigma_0 F_{\mu\nu}$

$$\rightarrow (-\bar{\Sigma}_0) \sigma^{\mu\nu} (-\Sigma_0) (-F_{\mu\nu})$$

odd under H-parity

$\rightarrow$  **forbidden by H-parity!**

Z-exchange, dim-5, dim-6 EM moments  
**vanish -- independent of scale of**

$\wedge$  **relative to**  $M_Z$

dimension (in NR EFT)	EM moments
4	
5	<del><math>\bar{\psi}_{B_0} \sigma^{\mu\nu} \psi_{B_0} F_{\mu\nu}</math></del> <del><math>\bar{\psi}_{B_0} \sigma^{\mu\nu} \gamma_5 \psi_{B_0} F_{\mu\nu}</math></del>
6	<del><math>\bar{\psi}_{B_0} \partial^\mu \psi_{B_0} \partial^\nu F_{\mu\nu}</math></del>   <del><math>\bar{\psi}_{B_0} \partial^\mu \psi_{B_0} \partial^\nu F_{\mu\nu}</math></del> <del><math>\bar{\psi}_{B_0} \gamma_5 \partial^\mu \psi_{B_0} \partial^\nu F_{\mu\nu}</math></del>

# H-parity even interactions of dark baryons with SM

## Allowed Interaction

## Importance

dark baryon

e.g.  $\frac{1}{\Lambda} \bar{\Psi}_{\Sigma_0} \sigma^{\mu\nu} \Psi_{\Lambda_0} F_{\mu\nu}$  ← photon

EM transition moments  
(between baryons with  
different H-parities)

$\frac{1}{\Lambda^3} \bar{\Psi} \Psi F_{\mu\nu} F^{\mu\nu}$  ←

polarizability (dim-7)

$\frac{1}{\Lambda^3} \bar{\Psi} \Psi \times \begin{cases} Q \cdot H u^c \\ Q \not{D} Q \\ \vdots \end{cases}$  ←

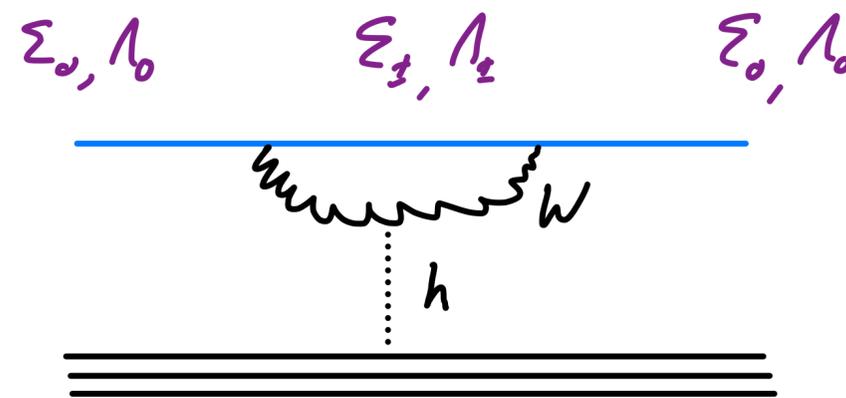

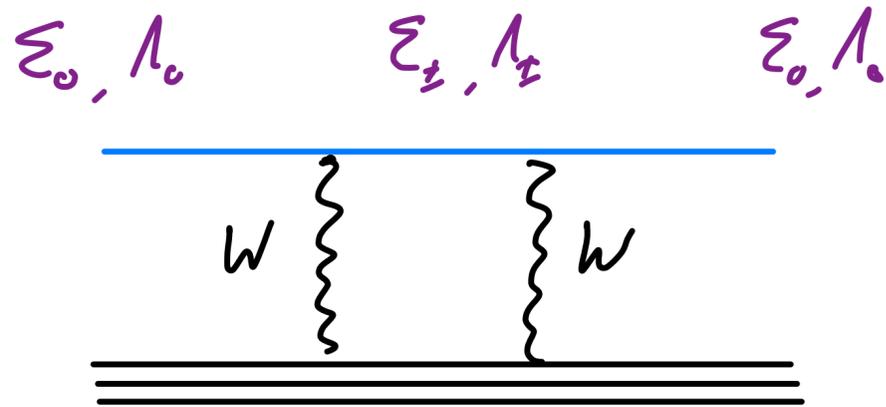

EW loops (dim-7)

Dark transition moments  
(inelastic DM)

Leading interaction  
for EW singlets

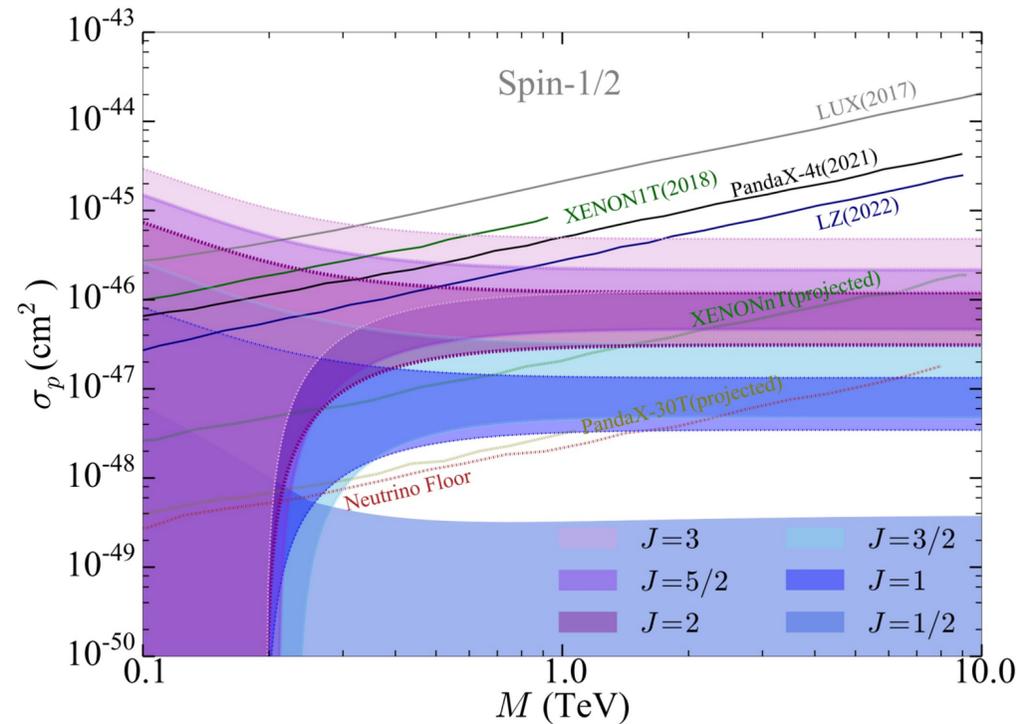

Leading interaction  
for EW multiplets

# Direct Detection through electroweak loops

EFT\* with  $M(\Sigma_0, \Lambda_0) \gg M_W$ :

\*(Majorana)

← 5-plet  
← triplet

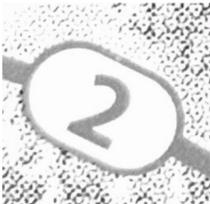

Chen, Ding, Hill [2309.02715]

Excellent opportunity for ongoing direct detection searches through nuclear recoil!

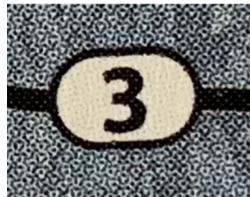

# Three Goals of my Talk:

Strongly coupled dark sectors provide well-motivated dark matter candidates with rich phenomenology.

Broad classes of dark baryon dark matter is weakly constrained by direct detection due to inherent symmetries of the dark sector.

**Dark mesons** provide a very promising target to probe these dark sectors.

LHC signals include:

- **dissappearing track searches**
- **new resonances** (neutral, +, ++) arising from a newly identified anomaly

# Working Example: $SU(3)$ with $N_f=3$ flavors of dark quarks

## Dark Baryons

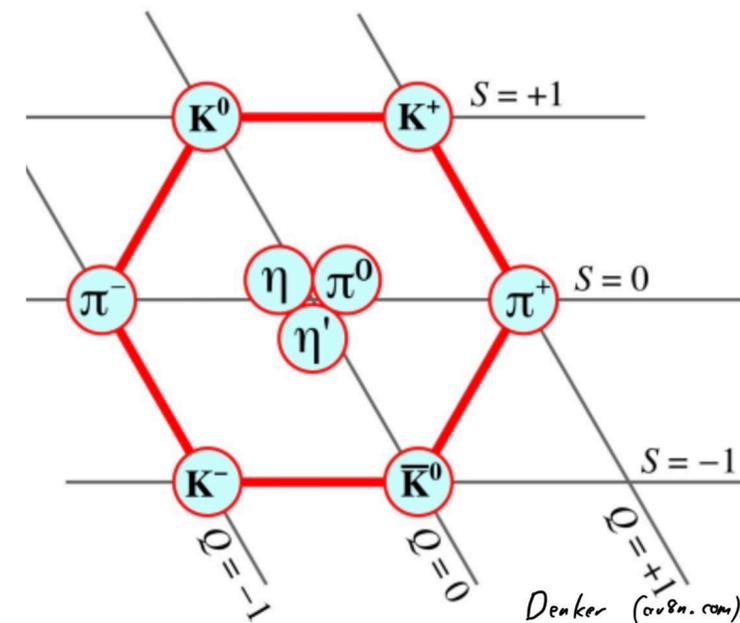

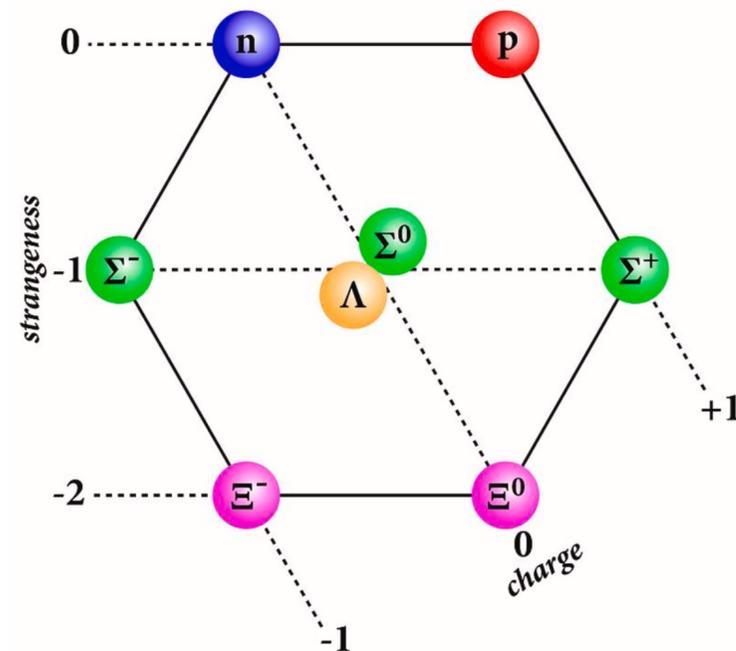

$$3 = \begin{pmatrix} \Sigma_1 \\ \Sigma_0 \\ \Sigma_{-1} \end{pmatrix} \quad 5 = \begin{pmatrix} \Lambda_{++} \\ \Lambda_+ \\ \Lambda_0 \\ \Lambda_- \\ \Lambda_{--} \end{pmatrix}$$

## Dark Mesons

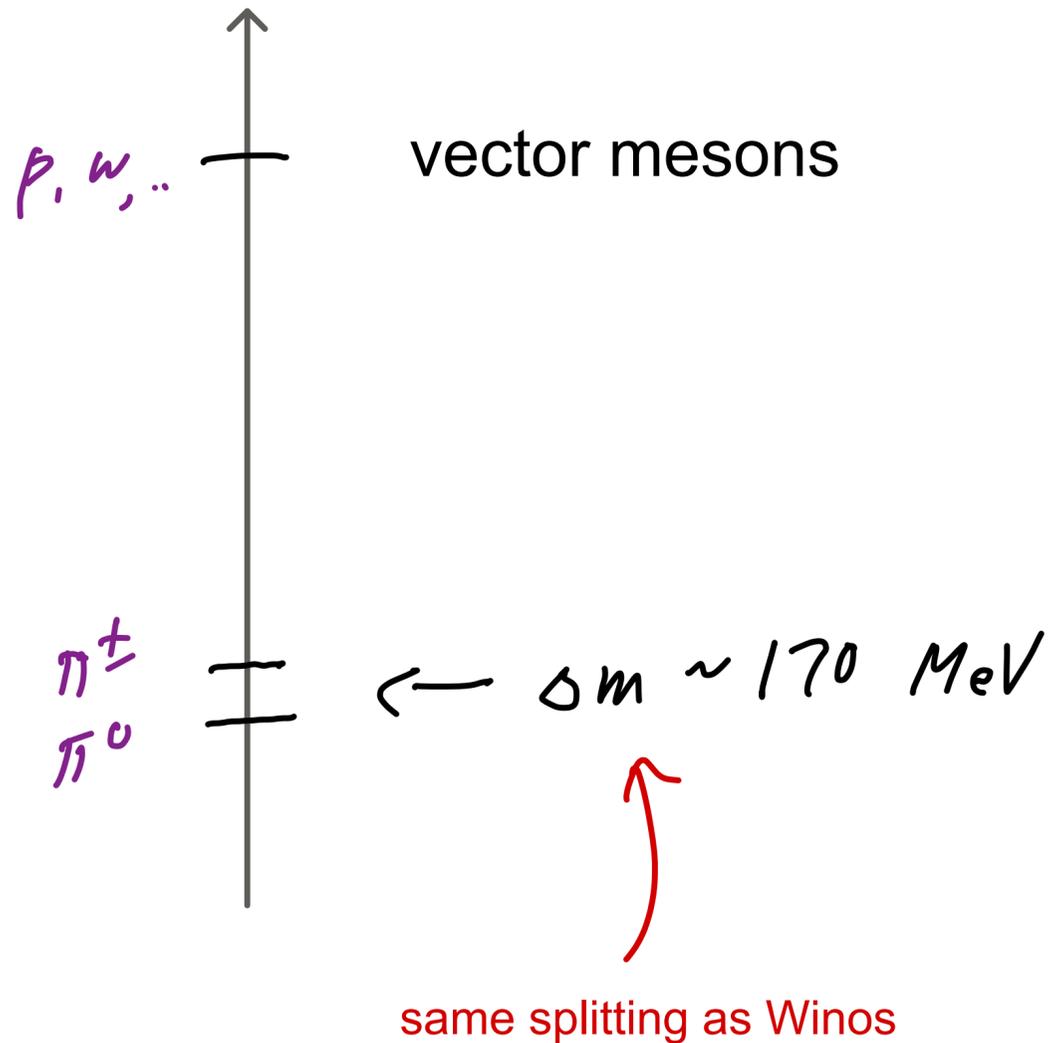

$$N_f \otimes N_f = 1 \oplus 3 \oplus 5 \oplus \dots (2N_f - 1)$$

$\uparrow$   $\uparrow$   $\uparrow$   
 $\eta'$  ,  $\begin{pmatrix} \pi^+ \\ \pi^0 \\ \pi^- \end{pmatrix}$  ,  $\begin{pmatrix} \eta^{++} \\ \eta^+ \\ \eta^0 \\ \eta^- \\ \eta^{--} \end{pmatrix}$

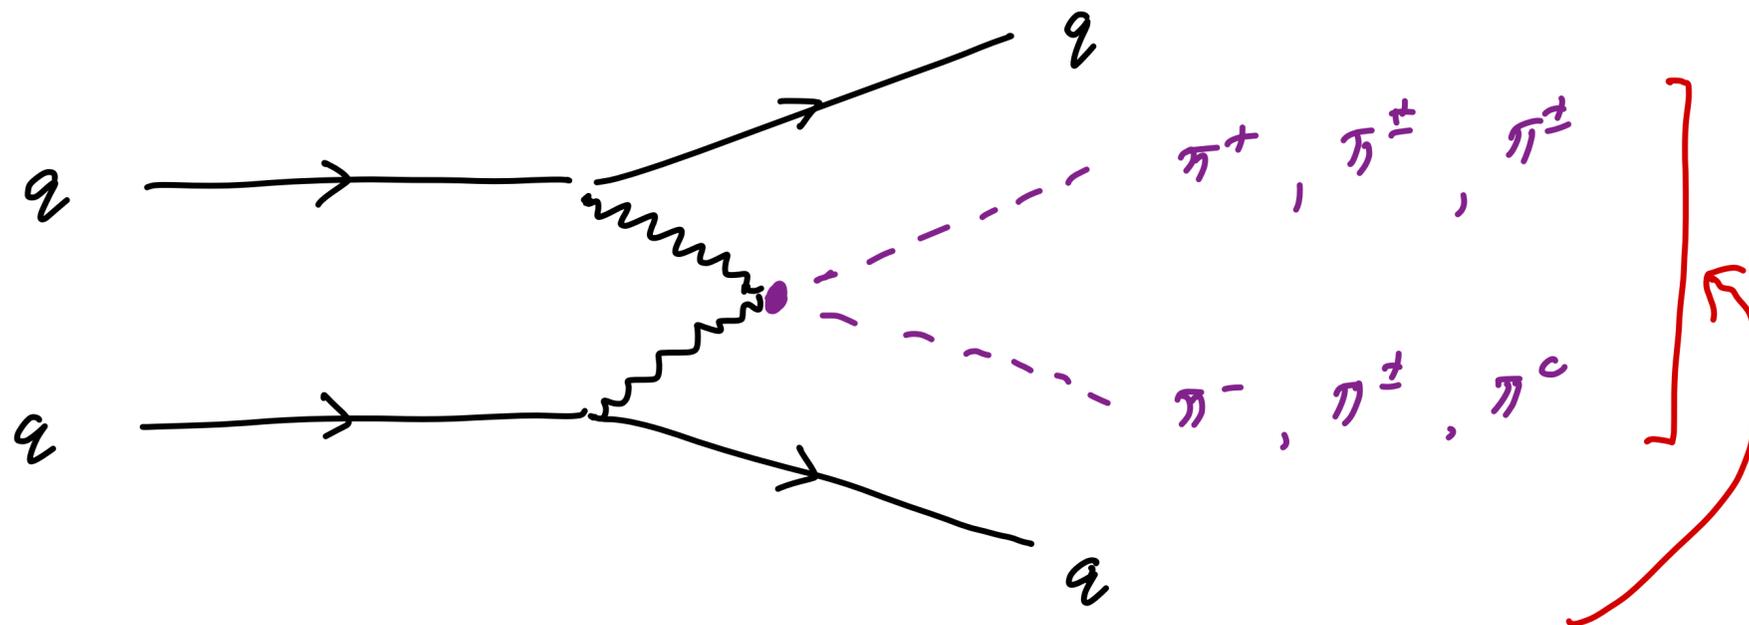

analogous  
to QCD

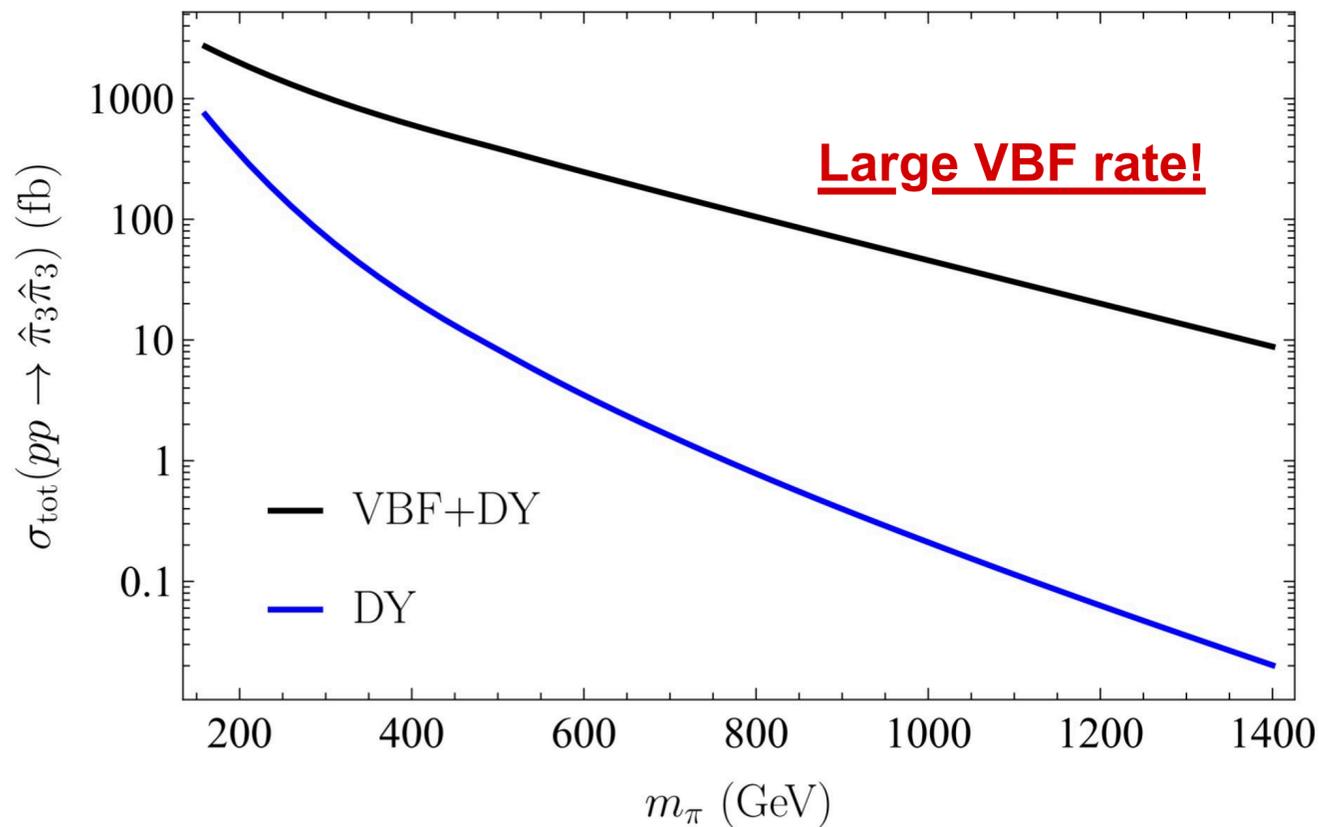

# Dark Triplet

Dominant production at LHC is **vector-boson fusion**:

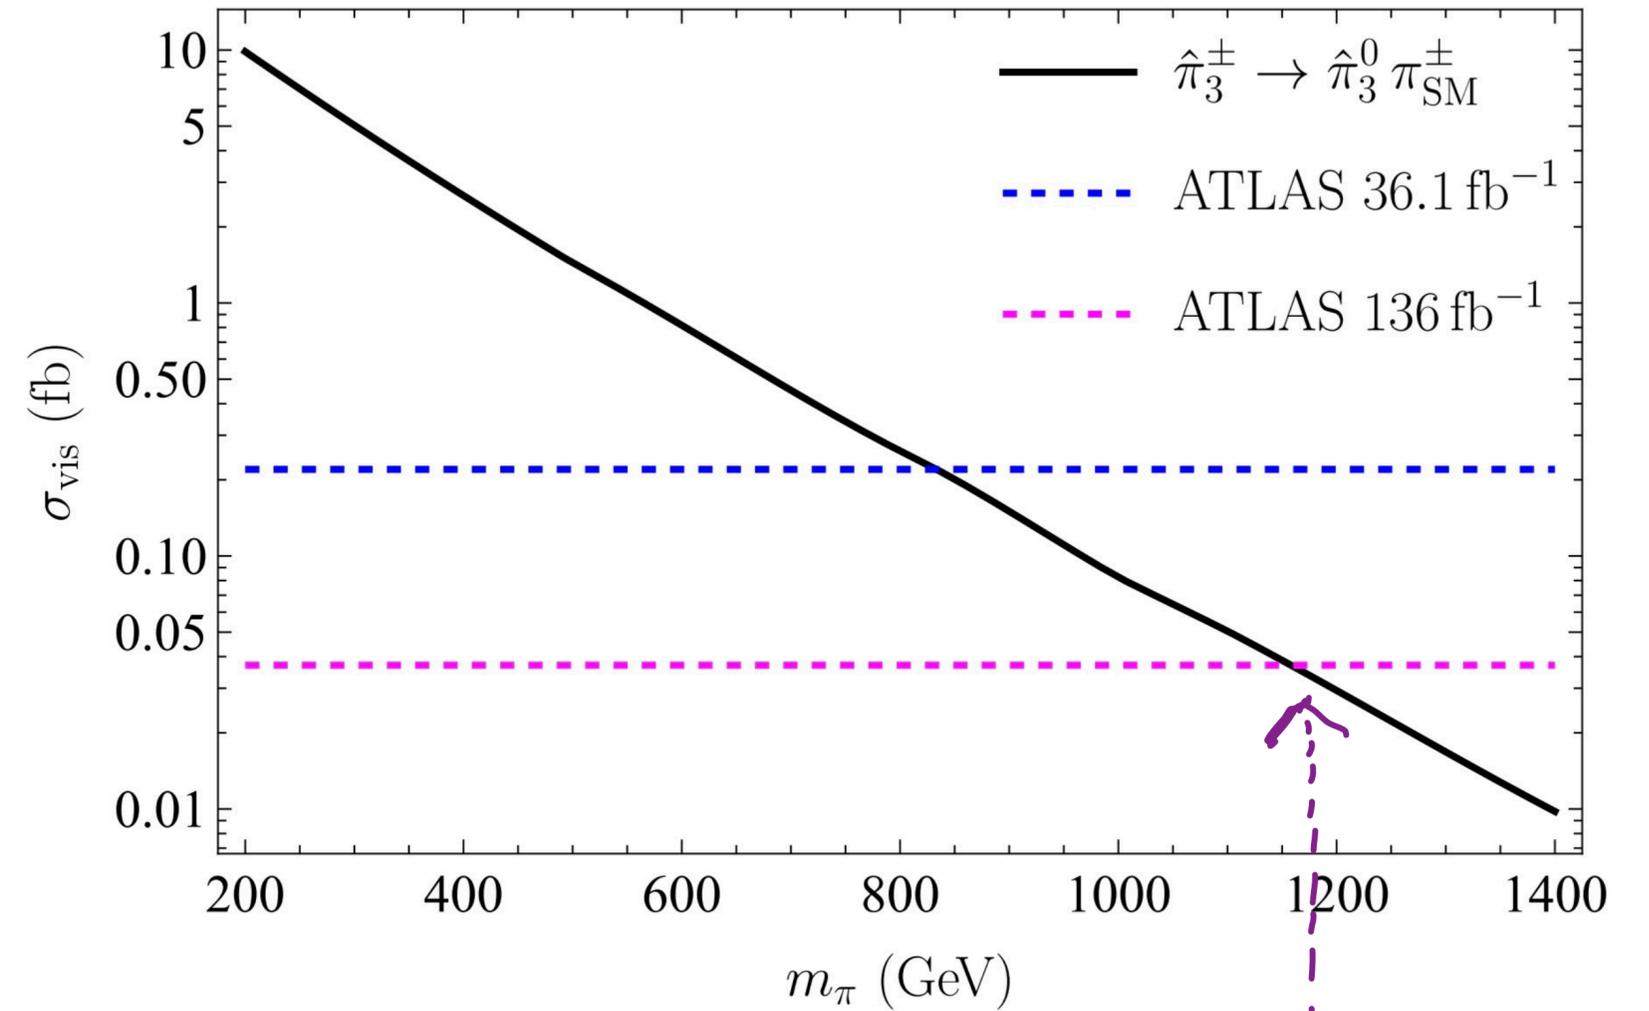

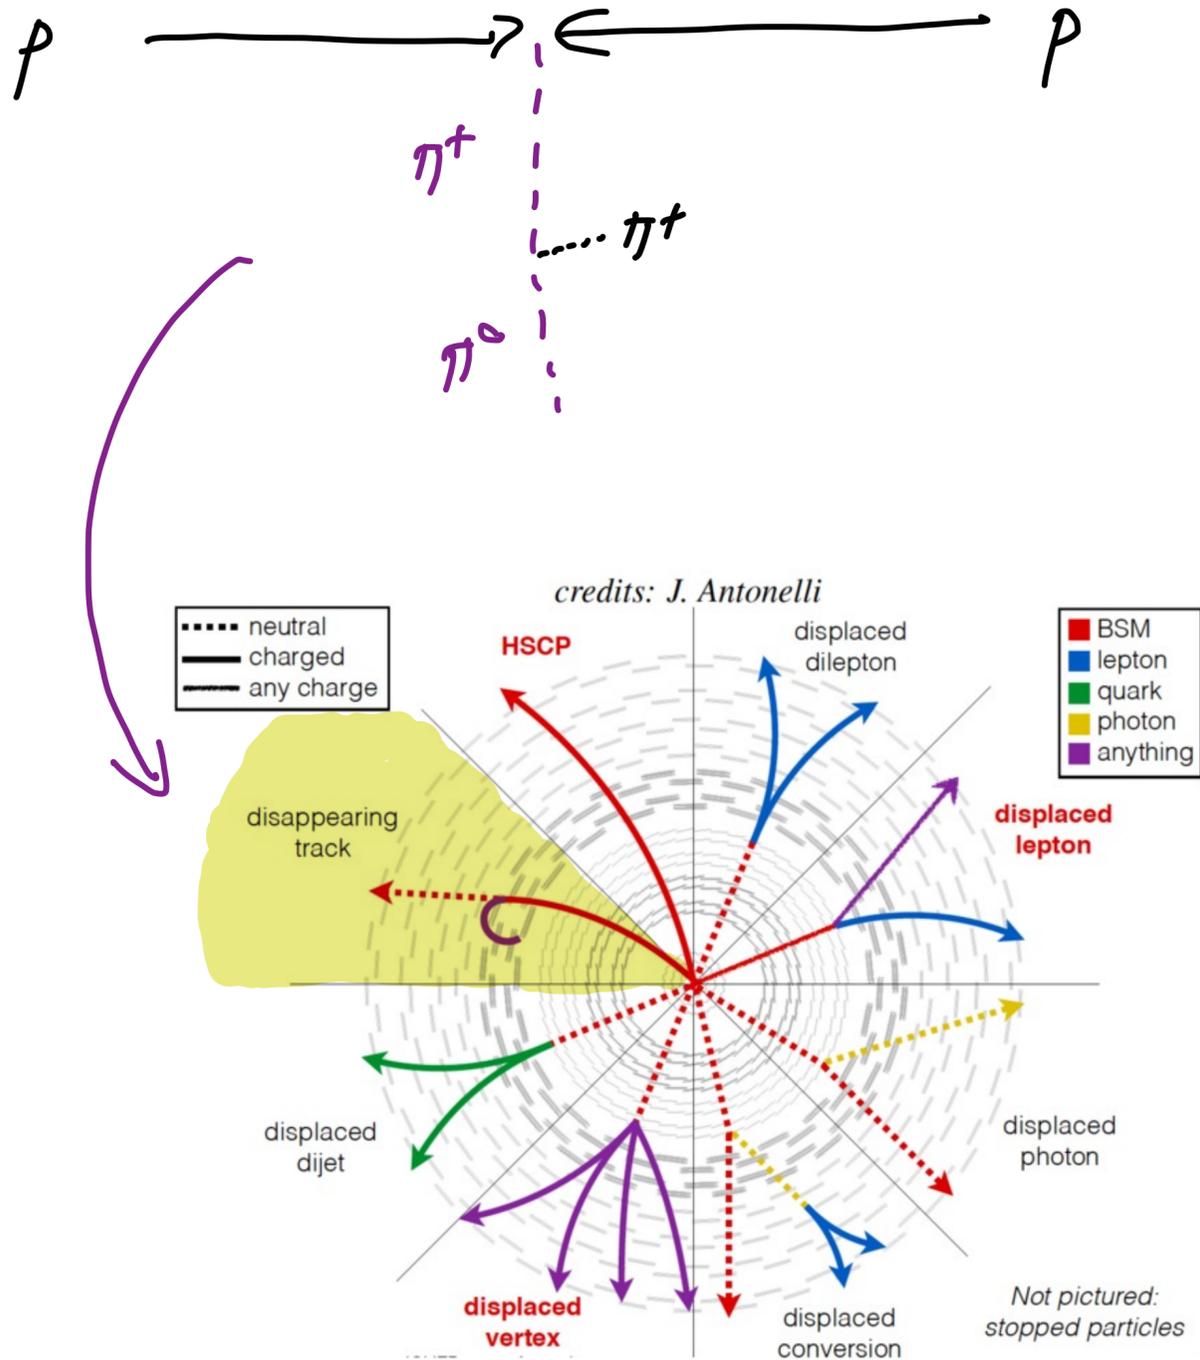

Pair produced because of G-parity

Asadi, Batz, Bernreuther,  
Costa, Homiller, GK  
2507.13430

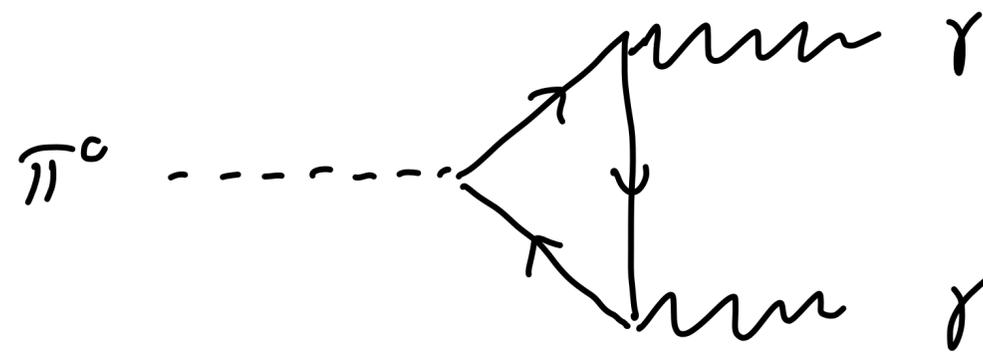

# Surprise #2: Large Rate for Disappearing Track Signal

$m_{\pi^\pm} \gtrsim 1.2 \text{ TeV}$

# Surprise #3: Dark 5-plet and a new Global Anomaly

Just like the  $\pi^0$  has a global-gauge-gauge anomaly in SM:

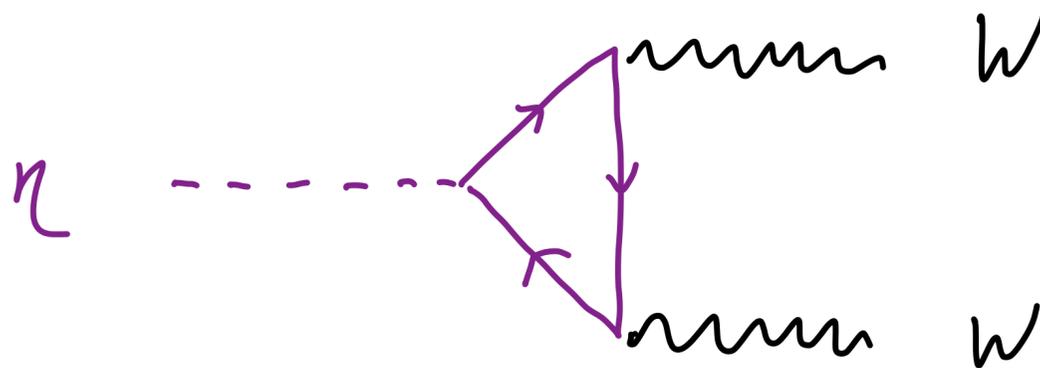

$$\mathcal{L}_{\text{anomaly}}^{\text{QED}} \propto \pi_{\text{SM}}^0 F \tilde{F} \text{Tr} [T^0 Q^2]$$

$$Q = \begin{pmatrix} 2/3 & & \\ & -1/3 & \\ & & -1/3 \end{pmatrix}$$

$$T^0 = \frac{1}{2} \begin{pmatrix} 1 & & \\ & -1 & \\ & & 0 \end{pmatrix}$$

The **5-plet**  $\eta$  is the unique\* dark pion that has a global-gauge-gauge anomaly:

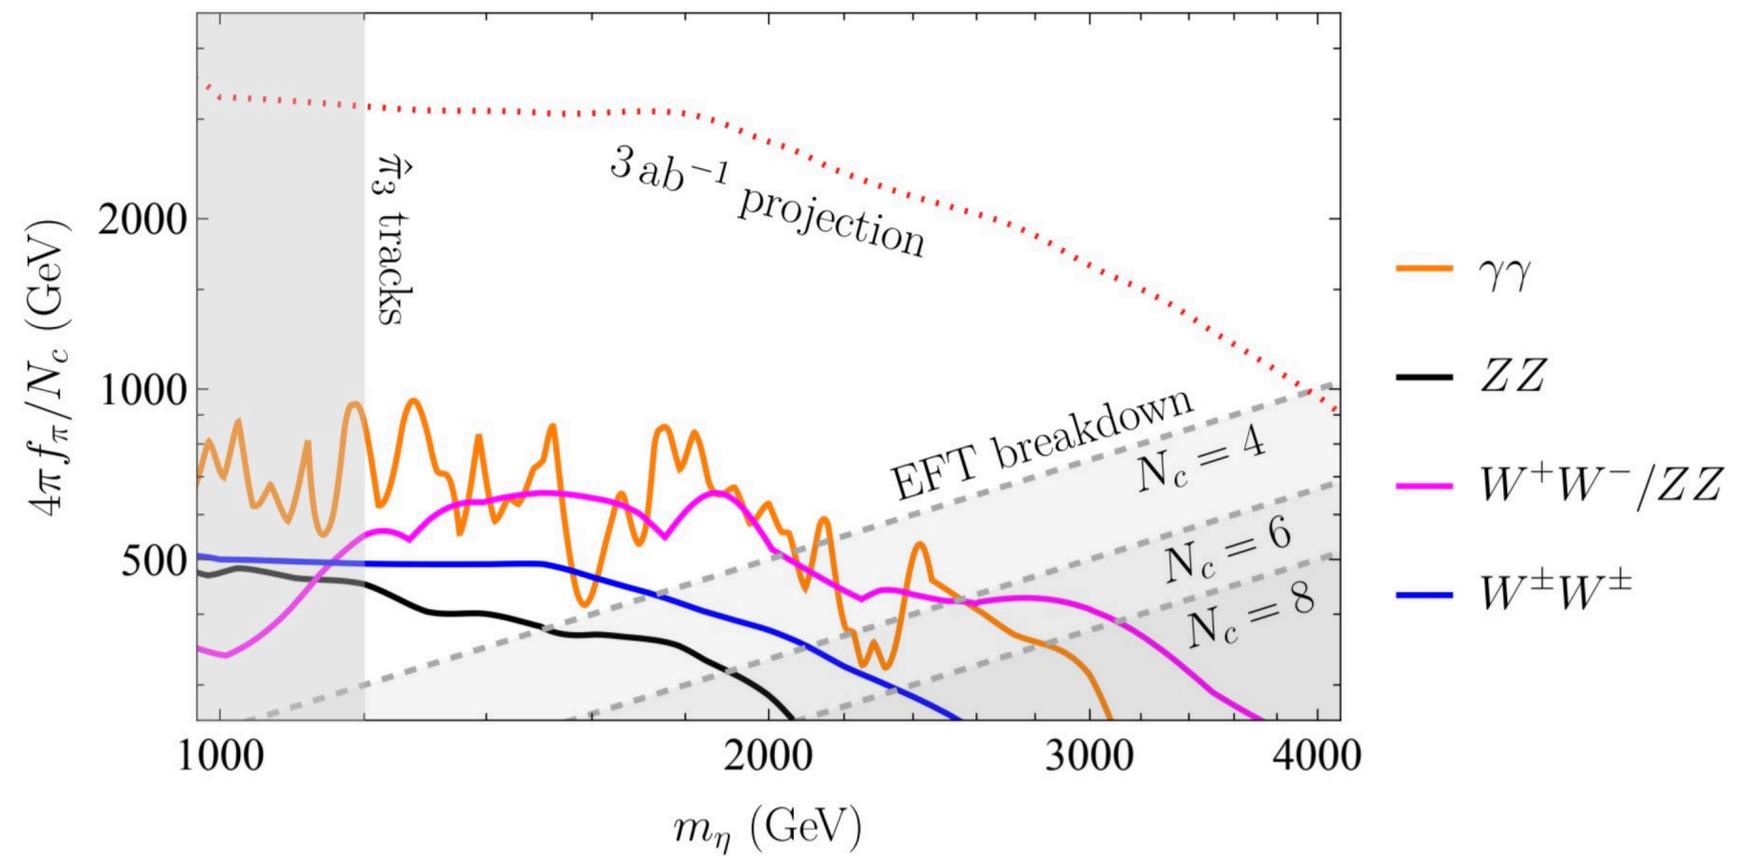

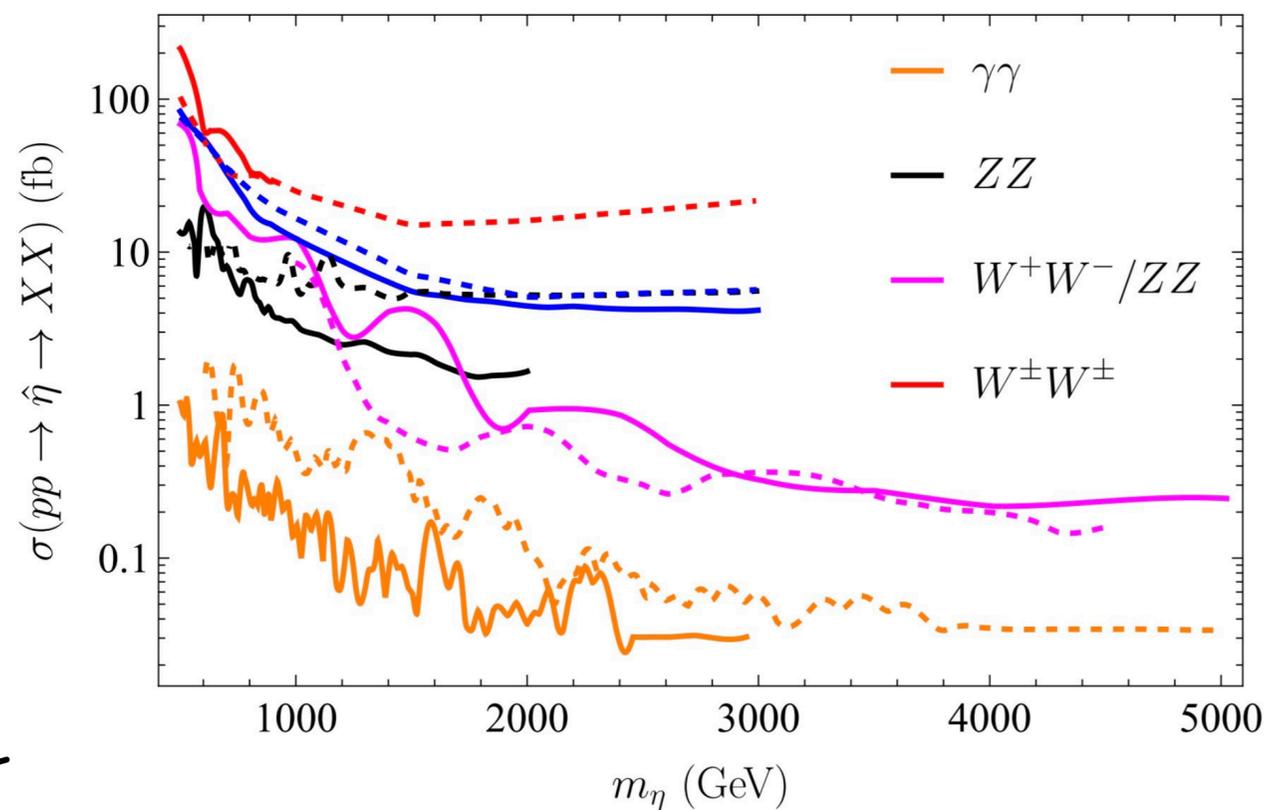

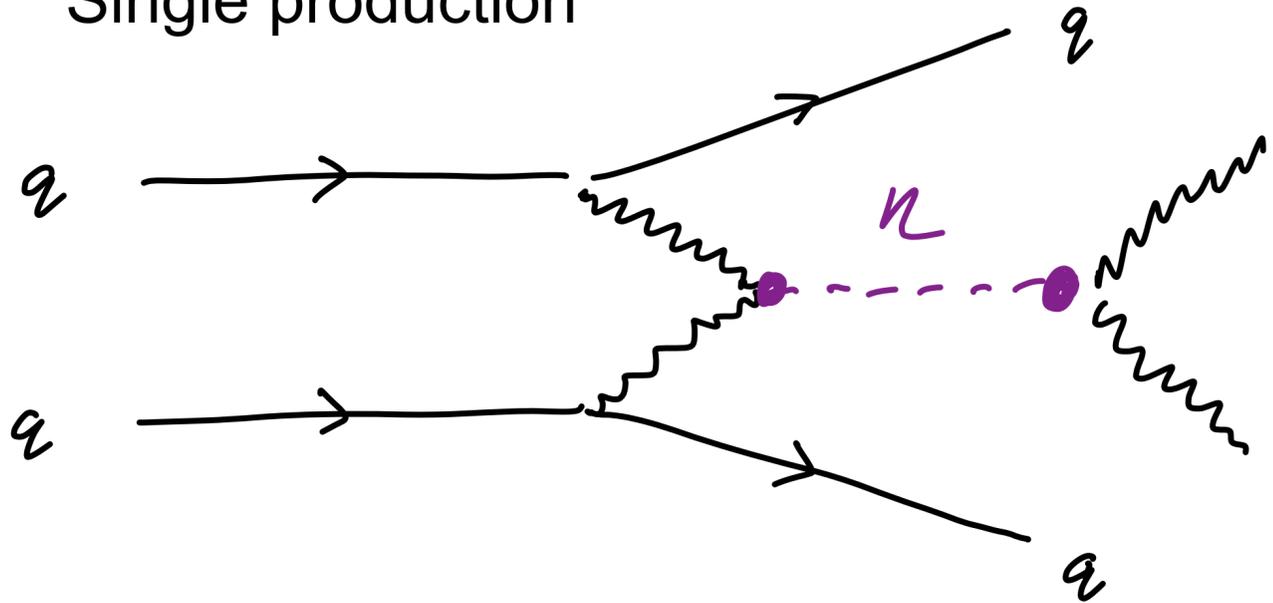

\*  $\eta'$  also has anomaly, but is heavy (not a pion)

$$\mathcal{L}_{\text{anomaly}} = \frac{g_W^2}{16\pi^2} \frac{N_c}{f_\pi} \hat{\phi}^a \varepsilon^{\mu\nu\alpha\beta} W_{\mu\nu}^i W_{\alpha\beta}^j \text{Tr} [T^a J^i J^j]$$

# Dark 5-plet Scalar Resonances

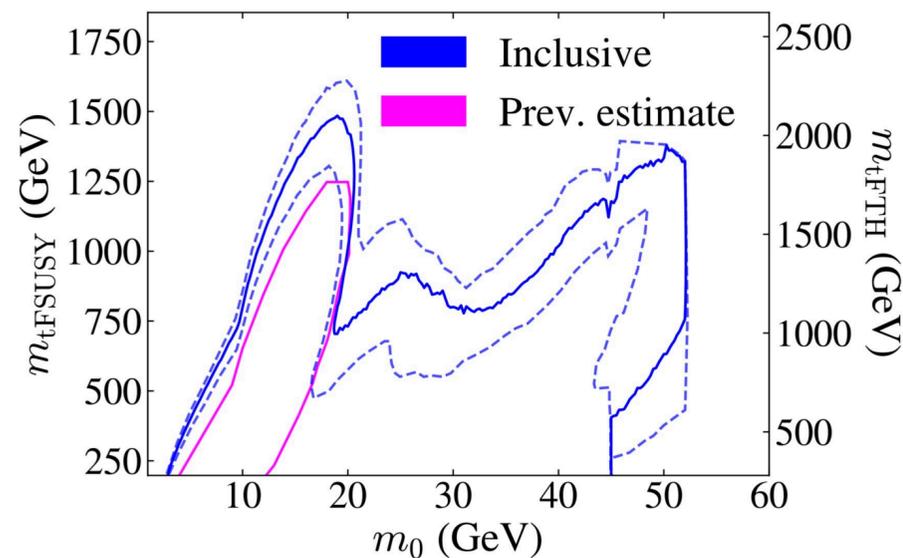

Single production

High lumi @ LHC has **great discovery potential!**

# More Dark Meson Surprises...

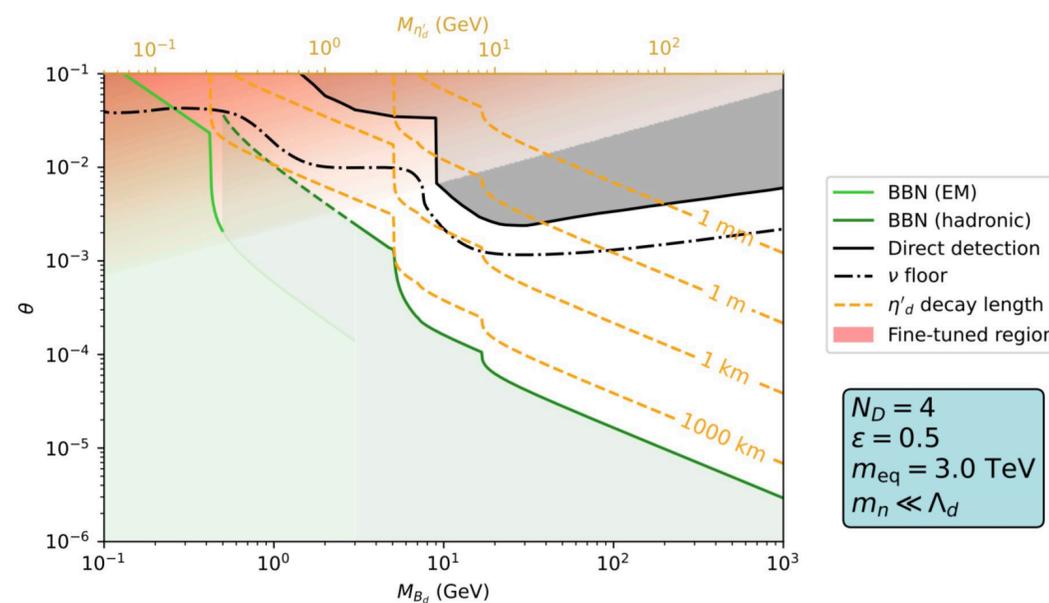

## Glueballs

Long-lived glueballs lead to displaced signals (MATHUSLA)

Batz, Cohen, Curtin, Gemmell, GK 2310.13731

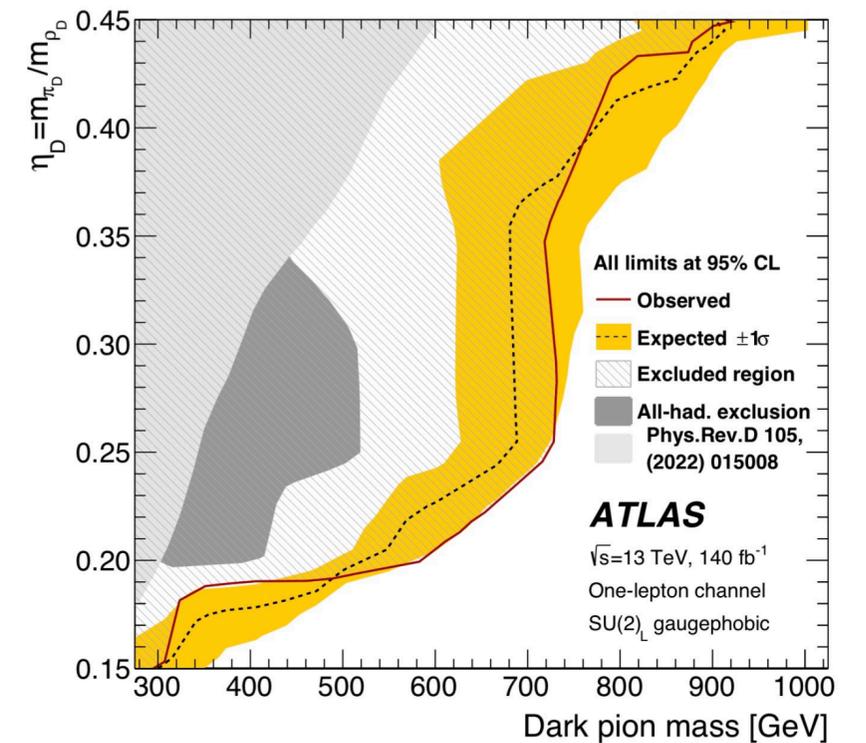

## 1-flavor theories

Long-lived eta' in theories with light composite DM

Fleming, GK, Neil, Schaich, Vranas 2412.14540

## 2+ flavor theories

Prompt signals at ATLAS in theories where mesons can decay through Higgs interactions

ATLAS results 2405.20061; based on GK, Martin, Ostdiek, Tong 1809.10184

# Summary

**H-parity** allows **dark baryons** to be viable DM candidates as low as a few hundred GeV despite being made of EW charged constituents.

LHC constraints on **triplet dark pions**  $> 1.2$  TeV from **dissappearing track searches** (huge rate from VBF & large multiplicity).

**5-plet dark pions** have global- $[SU(2)]^2$  anomaly providing **new TeV scale resonances** (neutral, +, ++) as a promising target for high-lumi LHC.

Thank you!
