## Consistency of standard cosmologies using Bayesian model comparison and tension quantification

Lukas Tobias Hergt, Sophie Henrot-Versillé, Matthieu Tristram, Douglas Scott

We present a unified Bayesian assessment of model comparison and data-set consistency for  $\Lambda$ CDM (cold dark matter plus a cosmological constant) and minimal extensions (neutrino mass, spatial curvature, constant or evolving dark energy) using cosmic microwave background (CMB), baryon acoustic oscillation (BAO), and type Ia supernova (SN) data. The major results are summarized in the first three figures. We quantify model preference with Bayesian evidence and assess consistency with complementary evidence- and likelihood-based diagnostics applied uniformly across data-set combinations. For the models considered, updated Planck processing systematically improves internal CMB consistency (low- $\ell$  versus high- $\ell$ , and primary CMB versus CMB lensing). The preference for a closed geometry and an associated "curvature tension" with BAO and/or CMB lensing are largely confined to earlier Planck likelihood implementations and weaken substantially when using updated CMB processing and more recent BAO measurements. Apparent evidence for evolving dark energy in CMB+BAO+SN combinations depends sensitively on the specific pairing of CMB and SN likelihoods: plausible alternatives shift inferred tensions by more than  $1\sigma$  and can completely reverse the preferred model. Allowing a free neutrino mass tends to absorb residual shifts without introducing new inconsistencies, and we do not find robust evidence for a standalone  $\tau$ -driven discrepancy once the full likelihood context is accounted for. We conclude that claims of a required update of our standard cosmological model from  $\Lambda$ CDM to  $w_0w_a$ CDM are premature.

# Overview

## 1) Context: Tensions in Cosmology

- Hubble tension ( $H_0$ )
- Clustering tension ( $\sigma_8, S_8$ )
- Today:
  - Cosmological Constant tension ( $\Lambda$  vs  $w_0w_a$ )

## 2) Data

- Cosmic Microwave Background (CMB)
- Baryon Acoustic Oscillations (BAO)
- Supernovae (SN)

## 3) Bayesian Statistics

- Parameter Estimation
- Model Comparison
- Data Consistency
  - Hidden tensions
  - Model Dimensionality

## 4) Results

- “Big Picture” overview
- $\Lambda$ CDM
  - Planck likelihood comparison
  - SN likelihood comparison
- $\Lambda$ CDM +  $\Omega_K$ 
  - Curvature tension
- $w_0w_a$ CDM
  - Cosmological Constant tension

## 5) New high- $\ell$ likelihoods ACT & SPT

## 6) Conclusion

# Overview

## 1) Context: Tensions in Cosmology

- Hubble tension ( $H_0$ )
- Clustering tension ( $\sigma_8, S_8$ )
- Today:
  - Cosmological Constant tension ( $\Lambda$  vs  $w_0w_a$ )

## 2) Data

- Cosmic Microwave Background (CMB)
- Baryon Acoustic Oscillations (BAO)
- Supernovae (SN)

## 3) Bayesian Statistics

- Parameter Estimation
- Model Comparison
- Data Consistency
  - Hidden tensions
  - Model Dimensionality

## 4) Results

- “Big Picture” overview
- $\Lambda$ CDM
  - Planck likelihood comparison
  - SN likelihood comparison

  - Curvature tension
- $w_0w_a$ CDM
  - Cosmological Constant tension

## 5) New high- $\ell$ likelihoods ACT & SPT

## 6) Conclusion

# The “Hubble Tension” (a.k.a. $H_0$ tension)

Credit: Adam G. Riess, Nature Rev. Phys. (2020)

# The “Clustering Tension” (a.k.a. $\sigma_8$ or $S_8$ tension): Weak Lensing (WL) vs Cosmic Microwave Background (CMB)

## What changed since 2021?

### Driving Factors

- New spectroscopic sample for  $N(z)$  estimation
- Updated  $N(z)$  calibration and estimation methods
- New imaging, new area

### Further changes

- Revised scale cut
- New  $P(k)$  emulation
- New IA modelling
- New sampler
- New tomography
- New analysis pipelines

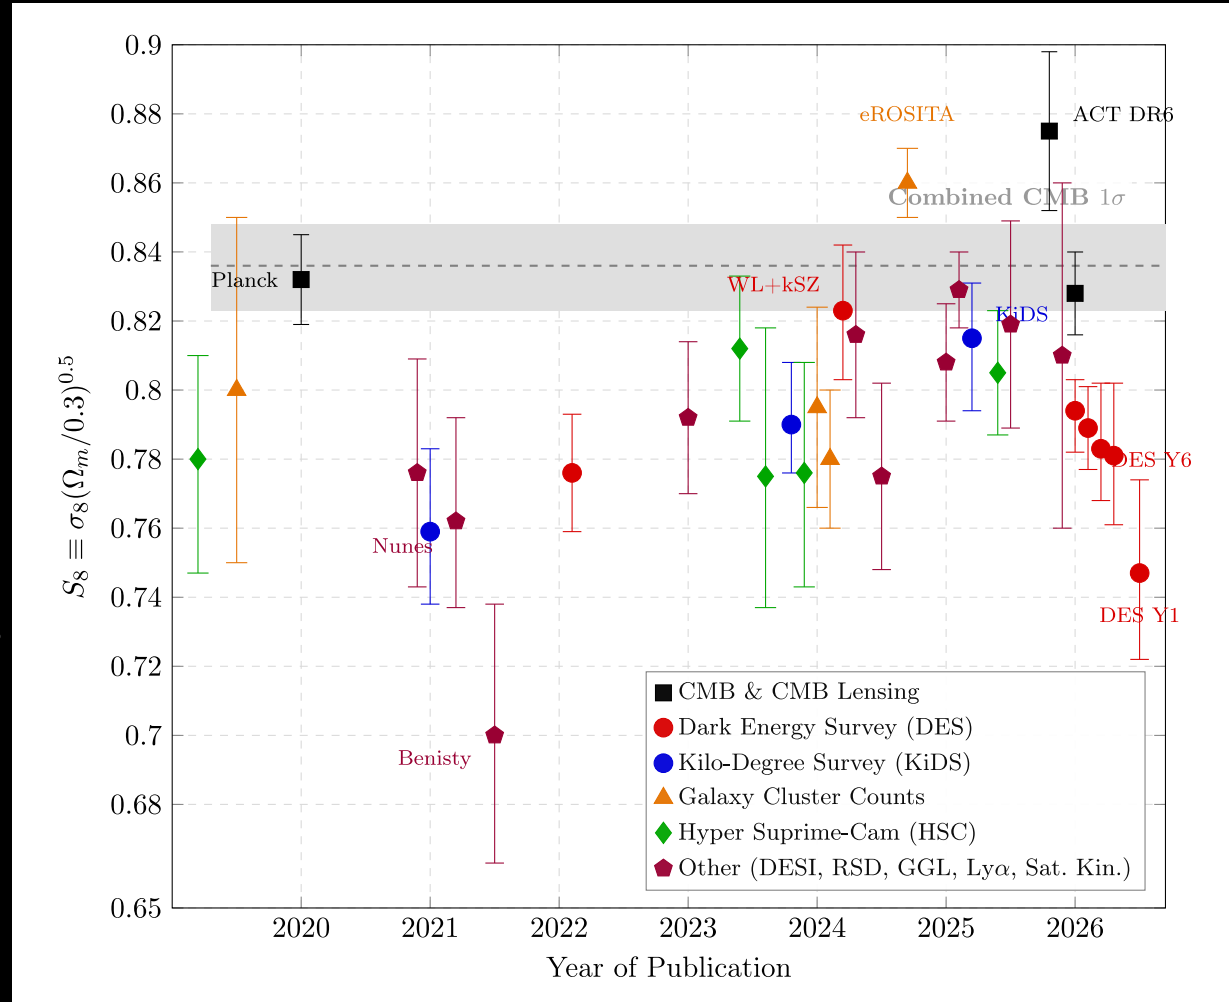

Wright et al. (2025b)

# The “Clustering Tension” (a.k.a. $\sigma_8$ or $S_8$ tension):

## Weak Lensing (WL) vs Cosmic Microwave Background (CMB)

- $\sigma_8$ : amplitude of matter density fluctuations
- ~ 2017: Discrepancy emerged between CMB and WL
- Trend:
  - until 2026: trend towards consistency
  - since this year: renewed tension?

# Cosmological Constant Tension ?

- Standard model of Cosmology:
  - $\Lambda$ CDM with cosmological constant  $\Lambda$
  - Corresponding equation-of-state parameters of Dark Energy:
    - $w_0 = -1$
    - $w_a = 0$
    - $w(a) = w_0 + w_a(1 - a)$
- CMB + BAO + SN:  
Preference for  $w_0w_a$ CDM?

Credit: DESI Collaboration (2025)

# Variations on Bayes Theorem

- Traditional form:

$$P(\theta|D, M) = \frac{P(D|\theta, M) \times P(\theta|M)}{P(D|M)}$$

Diagram illustrating the components of the Bayes theorem equation:

- The numerator is  $P(D|\theta, M) \times P(\theta|M)$ .
- The denominator is  $P(D|M)$ .
- The term  $P(D|\theta, M)$  is labeled as **likelihood  $\mathcal{L}(\theta)$**  (green text).
- The term  $P(\theta|M)$  is labeled as **prior  $\Pi(\theta)$**  (blue text).
- The term  $P(D|M)$  is labeled as **Bayesian evidence  $\mathcal{Z}$**  (red text).
- The entire expression is labeled as **posterior  $\mathcal{P}(\theta)$**  (orange text).

# Variations on Bayes Theorem

- Traditional form:

$$P(\theta|D, M) = \frac{P(D|\theta, M) \times P(\theta|M)}{P(D|M)}$$

Diagram annotations:  
-  $P(\theta|D, M)$  is labeled "posterior  $\mathcal{P}(\theta)$ " with an orange arrow pointing to it.  
-  $P(D|\theta, M)$  is labeled "likelihood  $\mathcal{L}(\theta)$ " with a green arrow pointing to it.  
-  $P(\theta|M)$  is labeled "prior  $\Pi(\theta)$ " with a blue arrow pointing to it.  
-  $P(D|M)$  is labeled "Bayesian evidence  $\mathcal{Z}$ " with a red arrow pointing to it.

- In computing:  
(e.g. MCMC or nested sampling)

$$\mathcal{P}(\theta) \times \mathcal{Z} = \mathcal{L}(\theta) \times \Pi(\theta)$$

Diagram annotations:  
- "Output" is written above a downward arrow pointing to  $\mathcal{P}(\theta)$ .  
- "Input" is written above a downward arrow pointing to  $\Pi(\theta)$ .

# Variations on Bayes Theorem

- Traditional form:

$$P(\theta|D, M) = \frac{P(D|\theta, M) \times P(\theta|M)}{P(D|M)}$$

$$\log \mathcal{R} = \log \mathcal{S} - \mathcal{I}$$

↑ a.k.a. Suspiciousness

# The 3 Pillars of Bayesian Inference

## Parameter Estimation

What do the data tell us about the parameters of a model?  
(e.g. the size or age of a  $\Lambda$ CDM universe)

### Bayes' Theorem:

$$P(\theta|D, M) = \frac{P(D|\theta, M) \times P(\theta|M)}{P(D|M)}$$

$$\text{posterior} = \frac{\text{likelihood} \times \text{prior}}{\text{evidence}}$$

$$P(\theta) = \frac{\mathcal{L}(\theta) \times \Pi(\theta)}{\mathcal{Z}}$$

$$\propto \mathcal{L}(\theta) \times \Pi(\theta)$$

## Model Comparison

How much does the data support one model compared to another?  
(e.g. cosmology with a cosmological constant vs with a dynamic dark energy)

$$\frac{P(M_1|D)}{P(M_2|D)} = \frac{P(D|M_1) \times P(M_1)}{P(D|M_2) \times P(M_2)}$$

$$= \frac{\mathcal{Z}_{M_1}}{\mathcal{Z}_{M_2}} \times \frac{P(M_1)}{P(M_2)}$$

$$\text{posterior odds} = \text{evidence ratio} \times \text{prior odds}$$

### Occam's razor:

$$\log \mathcal{Z} = \langle \log \mathcal{L} \rangle_{\mathcal{P}} - \mathcal{D}_{\text{KL}}$$

$$\text{log-evidence} = \text{fit} - \text{Occam penalty}$$

## Dataset Consistency

Do different datasets  $A$  and  $B$  make consistent predictions for the same model?  
(e.g. CMB vs BAO data)

$H_0$ : datasets described by the same parameters

$H_1$ : datasets described by distinct parameters

$$\mathcal{R} = \frac{\mathcal{Z}_{AB}}{\mathcal{Z}_A \mathcal{Z}_B},$$

$$\mathcal{R} = \log \mathcal{S} - \mathcal{I},$$

$$\log \mathcal{S} = \langle \log \mathcal{L}_{AB} \rangle_{\mathcal{P}_{AB}}$$

$$- \langle \log \mathcal{L}_A \rangle_{\mathcal{P}_A}$$

$$- \langle \log \mathcal{L}_B \rangle_{\mathcal{P}_B}$$

$$d - 2 \log \mathcal{S} \sim \chi_d^2$$

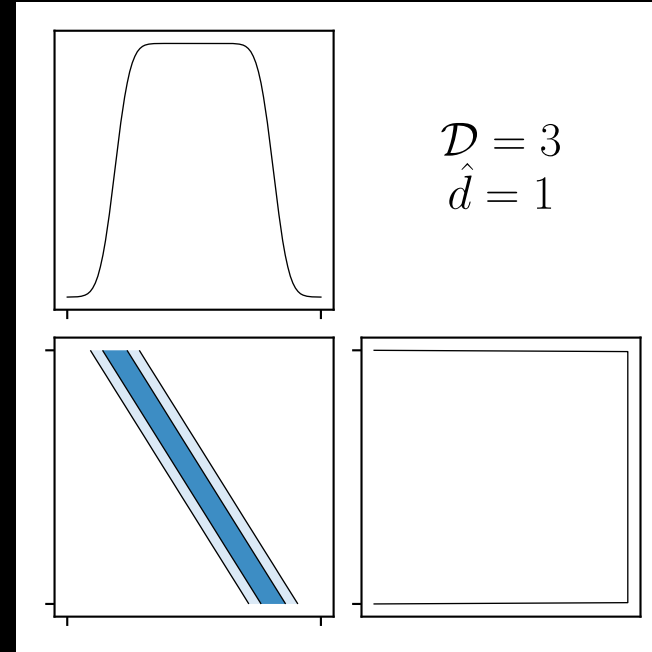

# Tensions can be hidden in 1D and 2D projections

Credit: Handley & Lemos, Phys. Rev. D 100 (2019)

- Projections can be misleading. → Can miss tensions after marginalisation.
- Evidence ratio,  $R$ , and likelihood ratio or “suspiciousness”,  $S$ , take full dimensionality into account (estimated by the Bayesian Model Dimensionality  $d$ ).

# Bayesian Model Dimensionality

Credit: Handley & Lemos, Phys. Rev. D 100 (2019)

- Same number (i.e. 2) of sampling parameters.
- Same Kullback–Leibler divergence  $D$  (i.e. same prior to posterior compression).
- Different dimensionality  $d$  (i.e. different number of *constrained* parameters).

# Bayesian Model Dimensionality in action

- Estimated from the log-likelihood (or  $\chi^2$ ) of the full sampling chain.
- Unconstrained parameters do not contribute!

$$d / 2 = \langle (\ln L)^2 \rangle - \langle \ln L \rangle^2$$

# Overview

## 1) Context: Tensions in Cosmology

- Hubble tension ( $H_0$ )
- Clustering tension ( $\sigma_8, S_8$ )
- Today:
  - Cosmological Constant tension ( $\Lambda$  vs  $w_0w_a$ )

## 2) Data

- Cosmic Microwave Background (CMB)
- Baryon Acoustic Oscillations (BAO)
- Supernovae (SN)

## 3) Bayesian Statistics

- Parameter Estimation
- Model Comparison
- Data Consistency
  - Hidden tensions
  - Model Dimensionality

## 4) Results

- “Big Picture” overview
- $\Lambda$ CDM
  - Planck likelihood comparison
  - SN likelihood comparison
- $\Lambda$ CDM +  $\Omega_K$ 
  - Curvature tension
- $w_0w_a$ CDM
  - Cosmological Constant tension

## 5) New high- $\ell$ likelihoods ACT & SPT

## 6) Conclusion

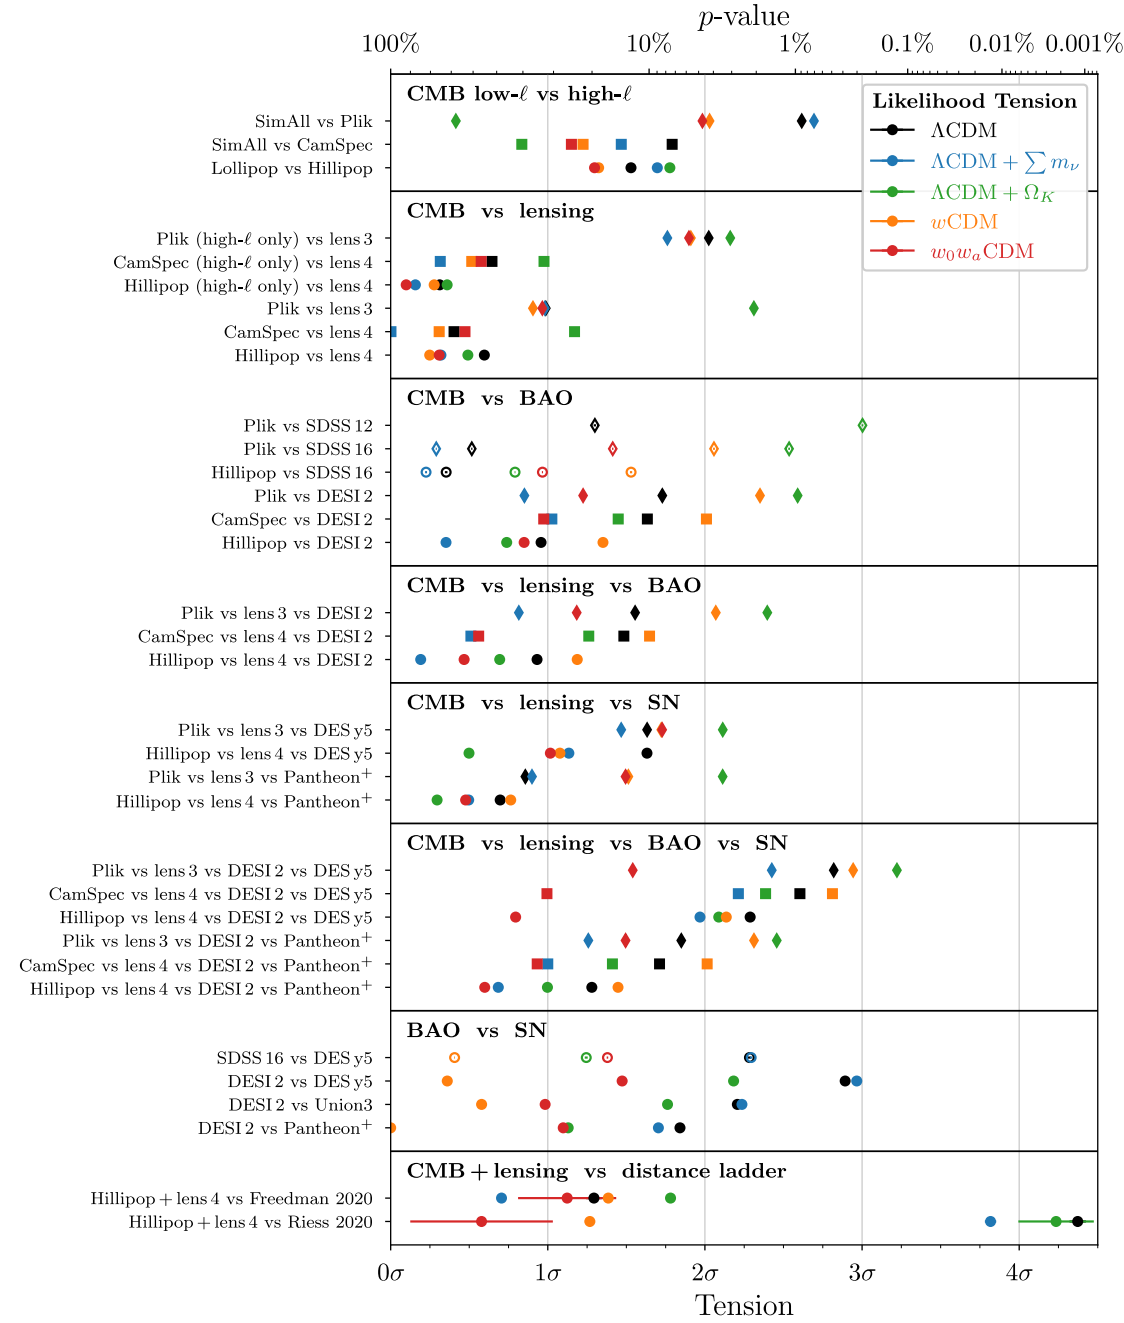

# Slightly overwhelming overview

## Range of dataset combinations

- **CMB:** Planck PR3 and PR4
  - low- $\ell$ : SimAll, Lollipop
  - high- $\ell$ : Plik, CamSpec, Hillipop
- **CMB lensing:**
  - Planck PR3 and PR4
- **BAO:**
  - SDSS DR12 and DR16
  - DESI DR2
- **SN:**
  - Pantheon+
  - DES year-5

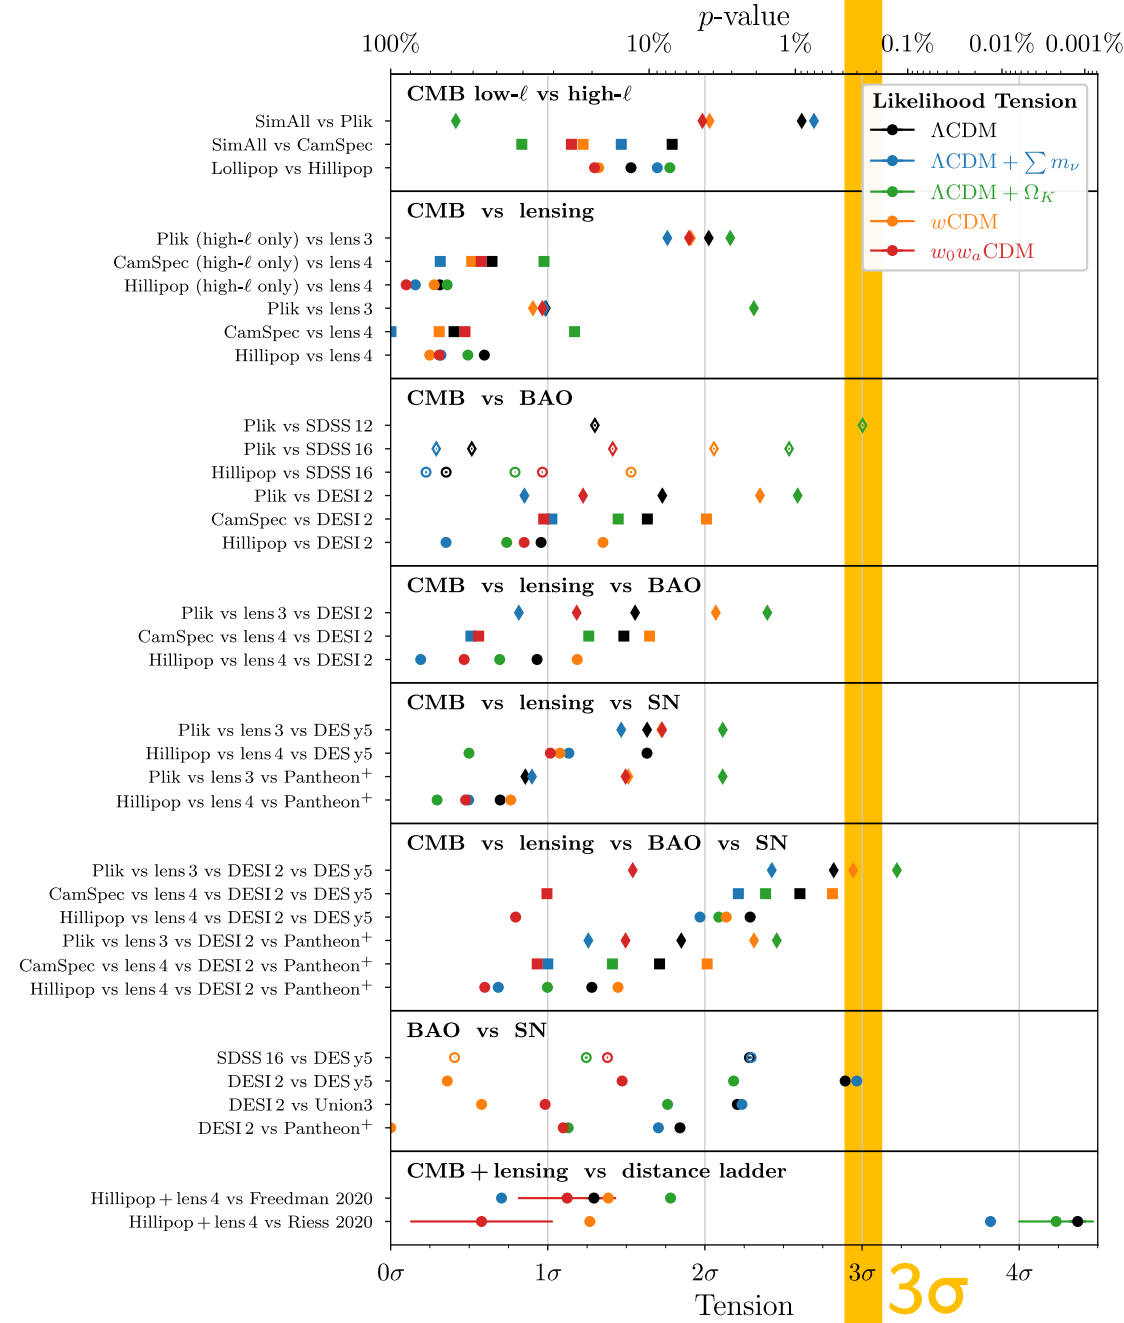

## Range of models

- $\Lambda$ CDM: dominated by cold dark matter and cosmological constant  $\Lambda$
- $\Lambda$ CDM +  $\sum m_\nu$ : 3 massive neutrinos (instead of just one)
- $\Lambda$ CDM +  $\Omega_K$ : non-zero curvature
- $w$ CDM: constant equation of state  $w$  of dark energy
- $w_0 w_a$ CDM: evolving equation of state  $w(a)$  of dark energy

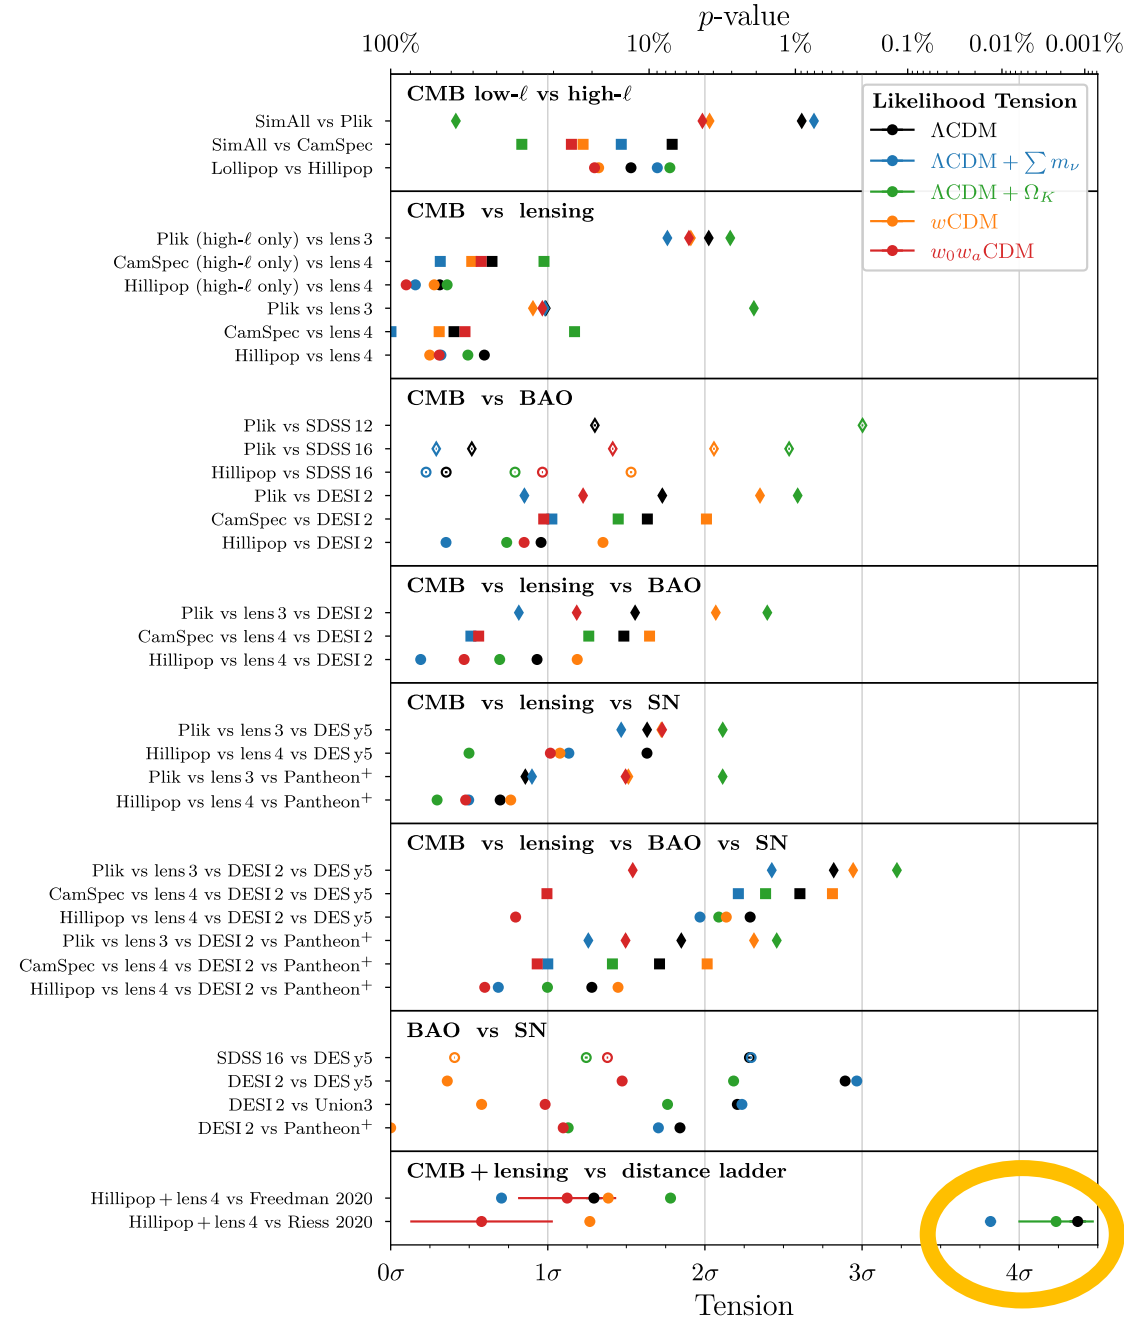

# Slightly overwhelming overview

Remark 1:  
Almost all points below  $3\sigma$  line.

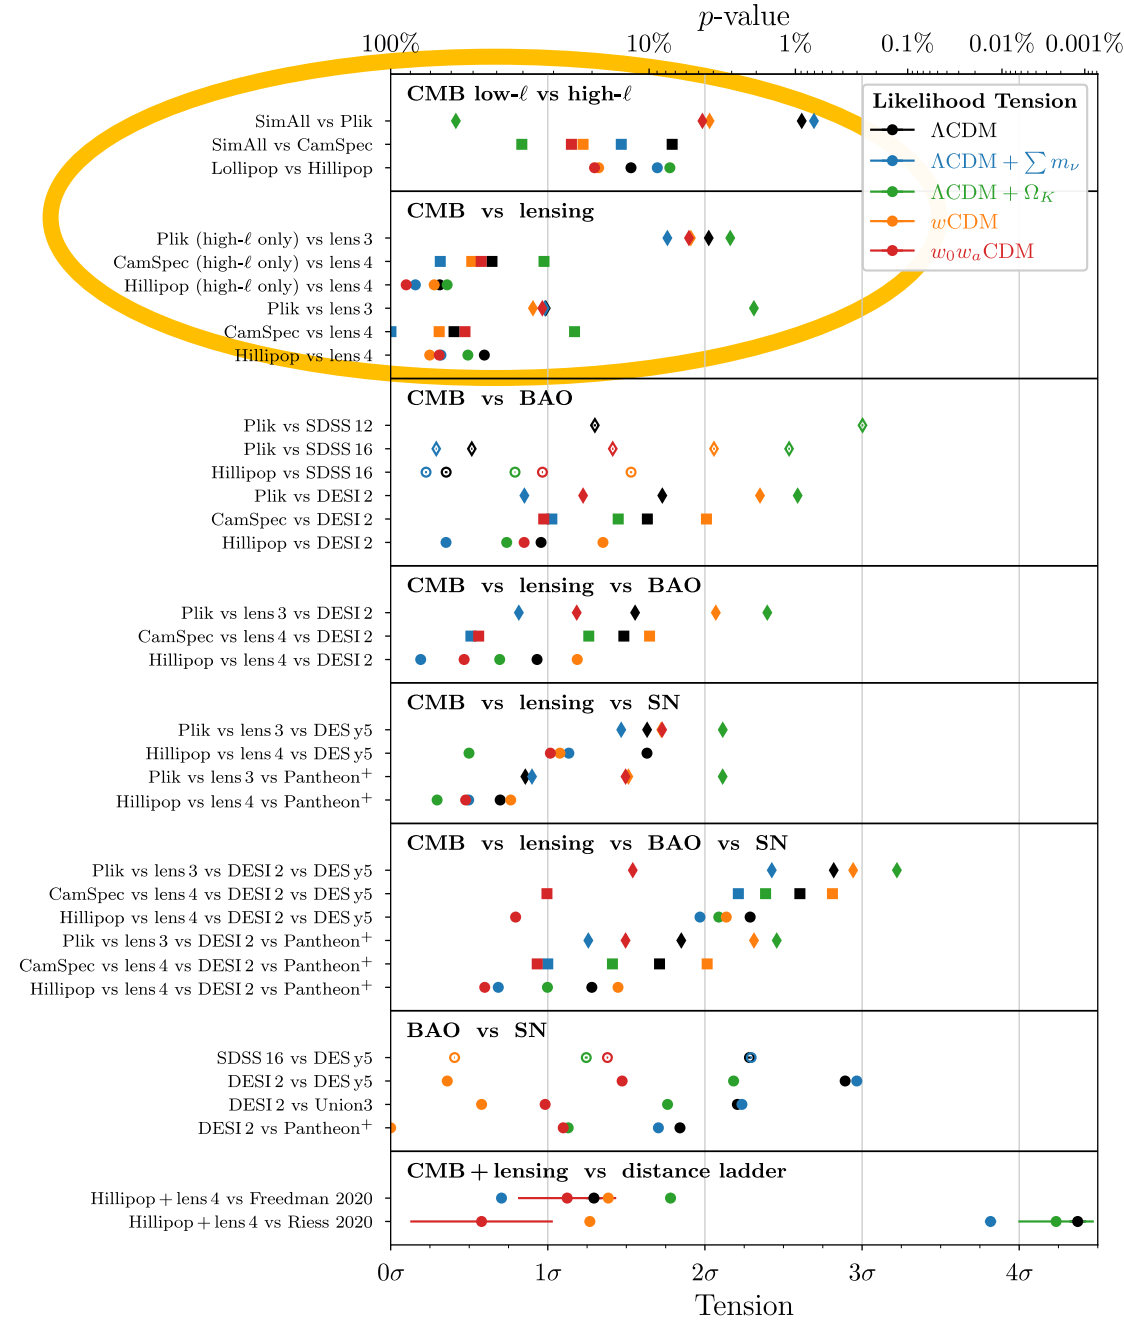

# Slightly overwhelming overview

Remark 2:  
Hubble Tension clearly strongest.

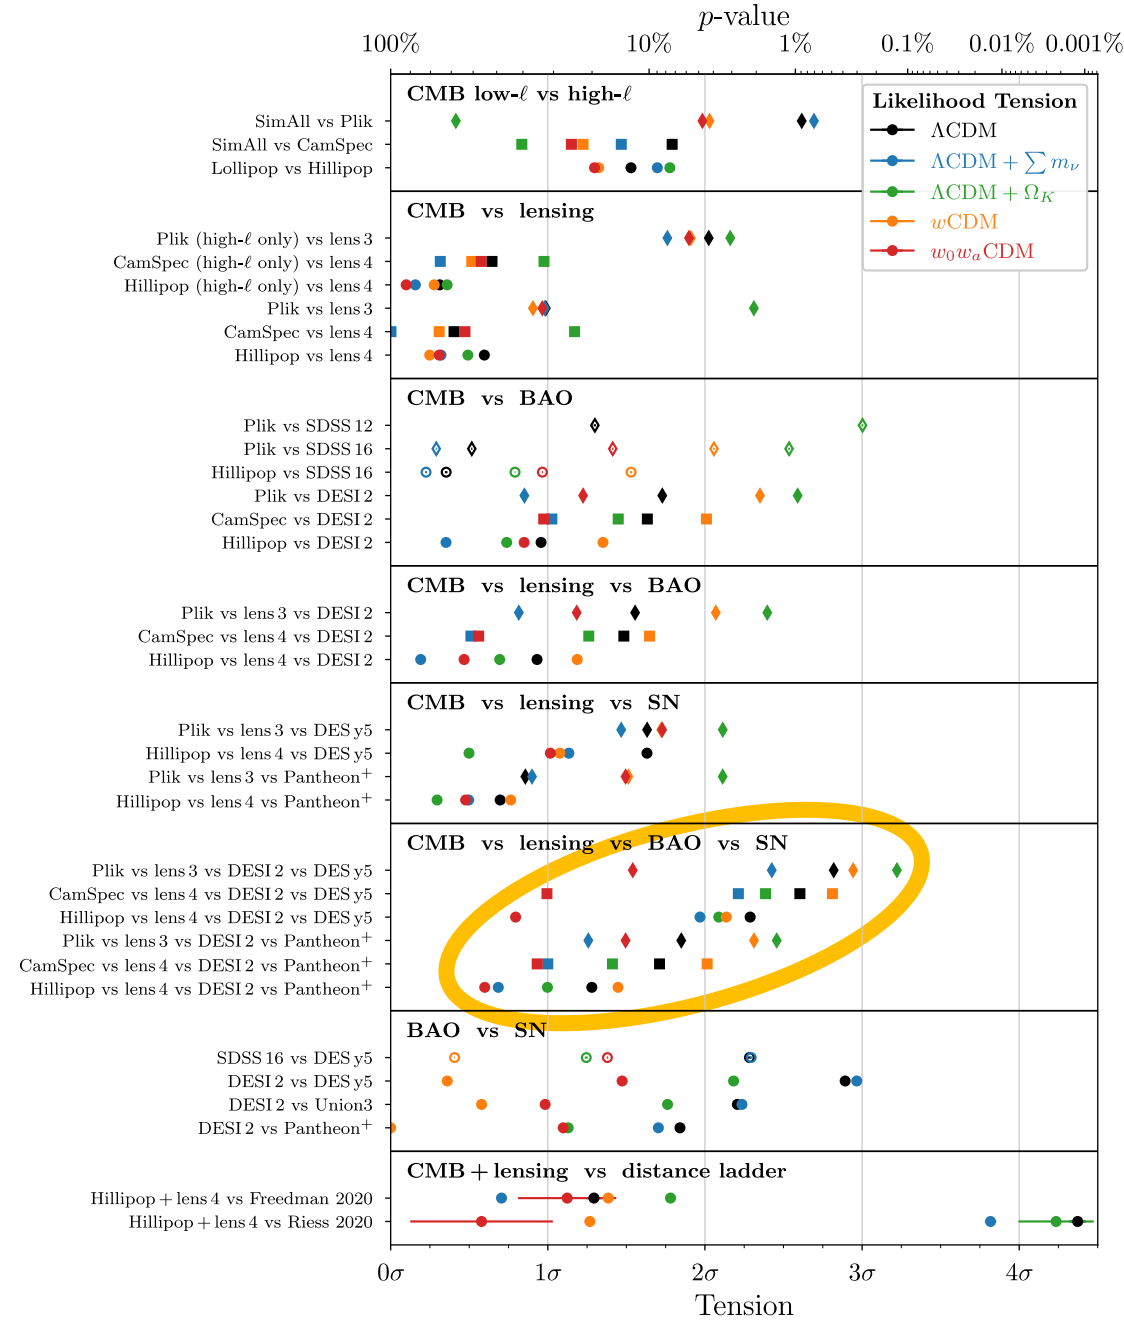

# Slightly overwhelming overview

Remark 3:  
CMB internal tensions have also reached beyond  $2\sigma$  in the past.

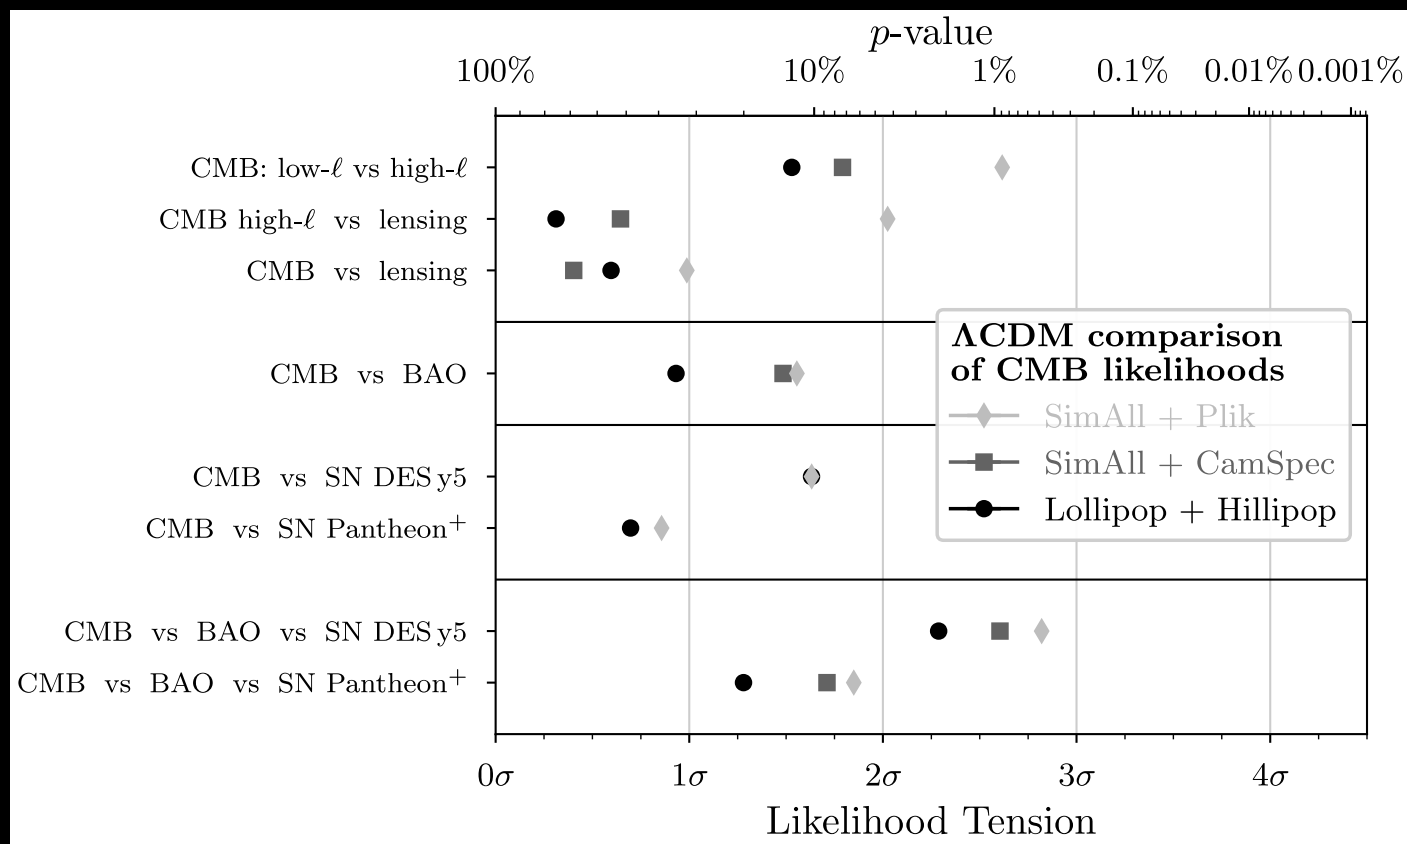

# Slightly overwhelming overview

Remark 4:  
Highly variable tension statistics dependent on dataset choices for CMB vs BAO vs SN.  
(Independent of theory model!)

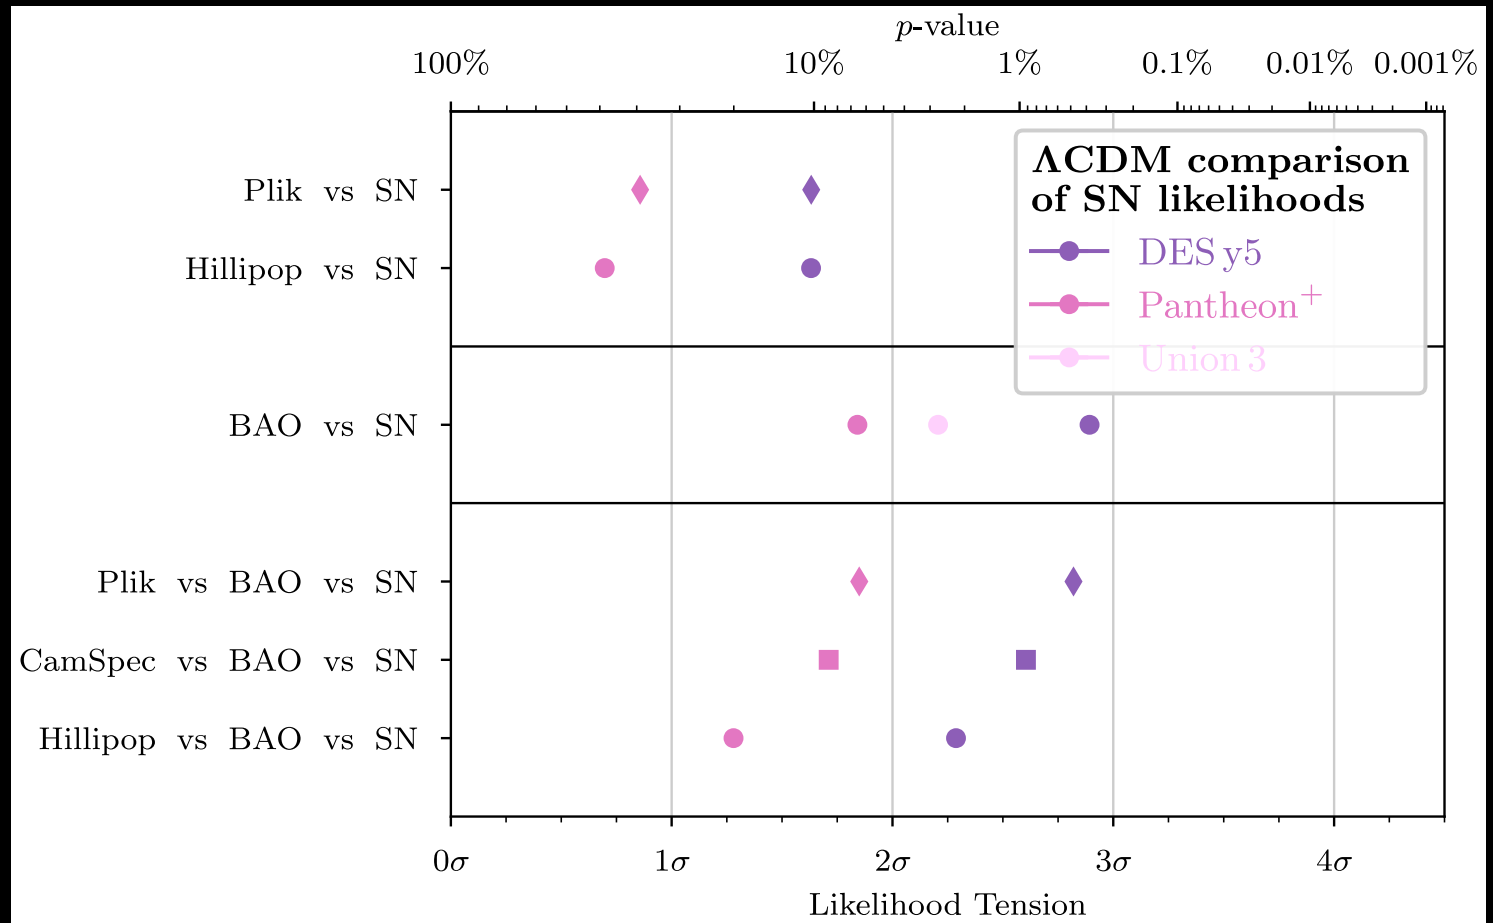

# Comparison of Planck Likelihoods

- **Plik:**
  - Planck PR3 (2018)
- **CamSpec:**
  - Planck PR4 (2020)
  - pre-cleaning of galactic dust
  - fitting of foreground residuals
- **Hillipop:**
  - Planck PR4 (2020)
  - fitting of foreground spectra

**Takeaway:**  
 Big shifts in tension statistics from choice of CMB likelihood pipeline (for the same data!)

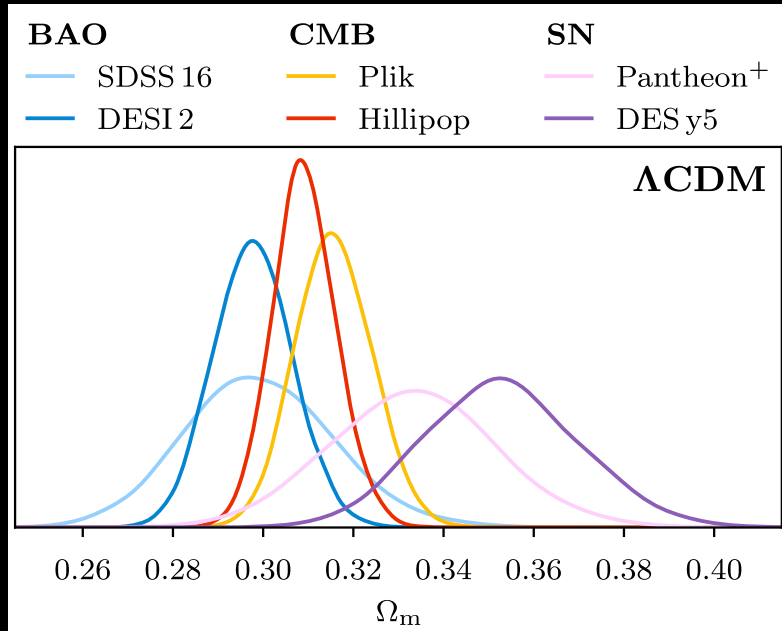

# Comparison of Supernovae Likelihoods

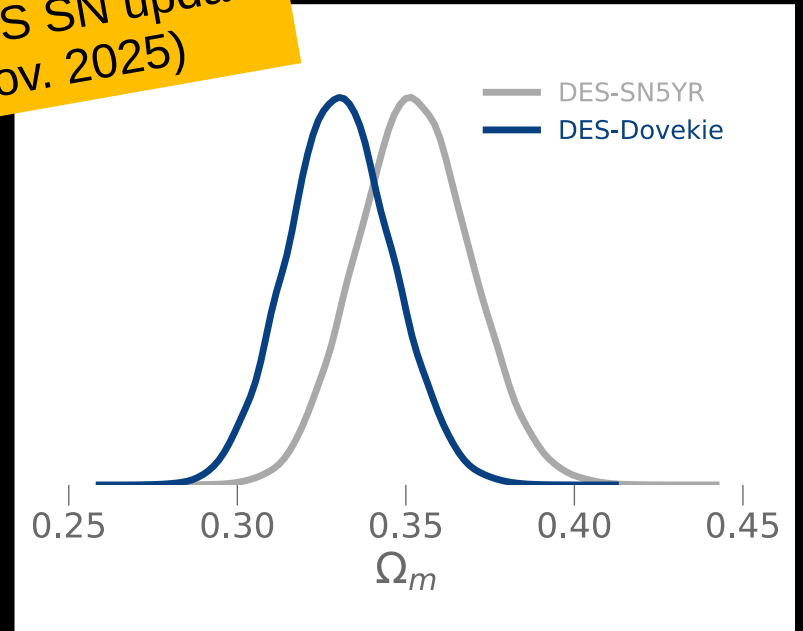

Takeaway:

Big shifts in tension statistics from choice of SN likelihood.

# Tension driving parameter: Matter density $\Omega_m$

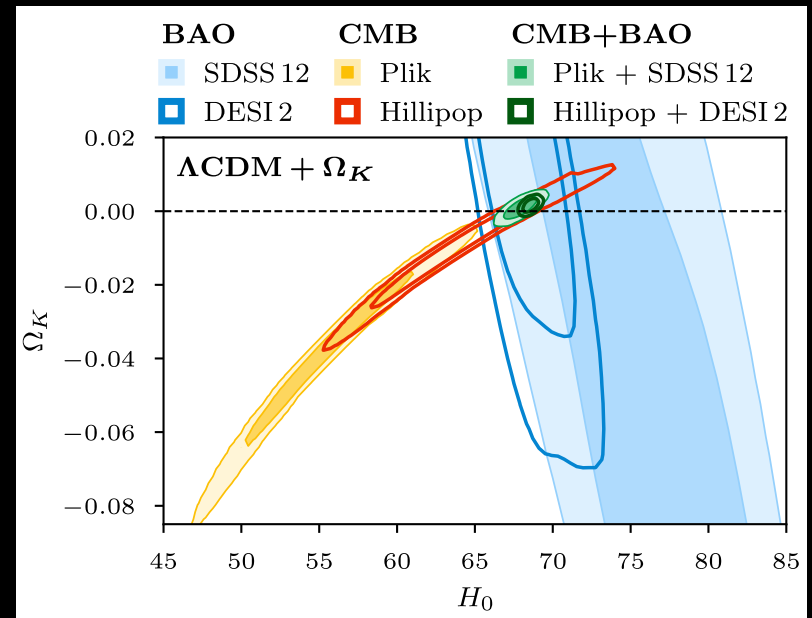

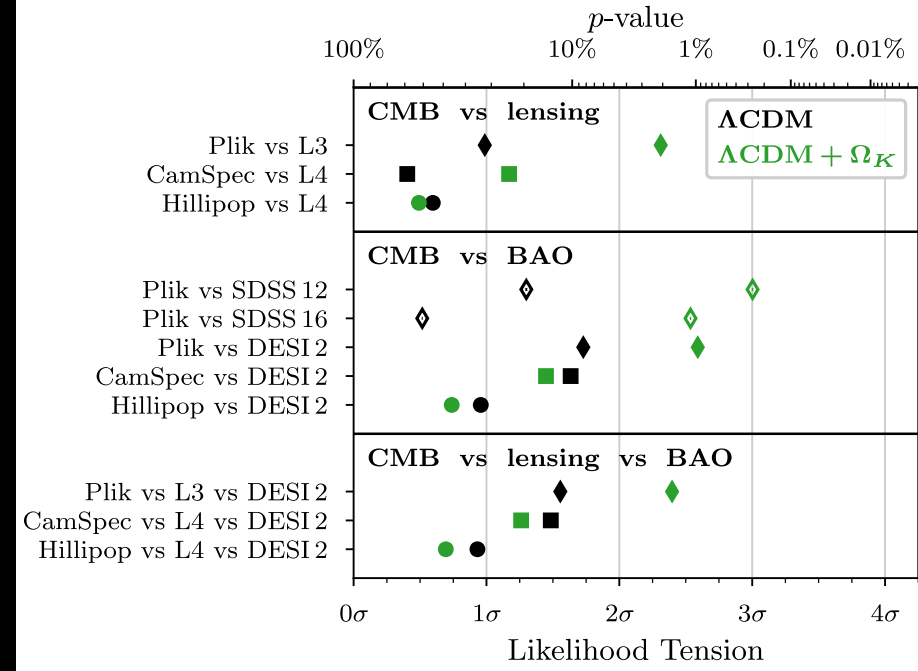

DES SN update  
(Nov. 2025)

Credit: Popovic et al. (2025)

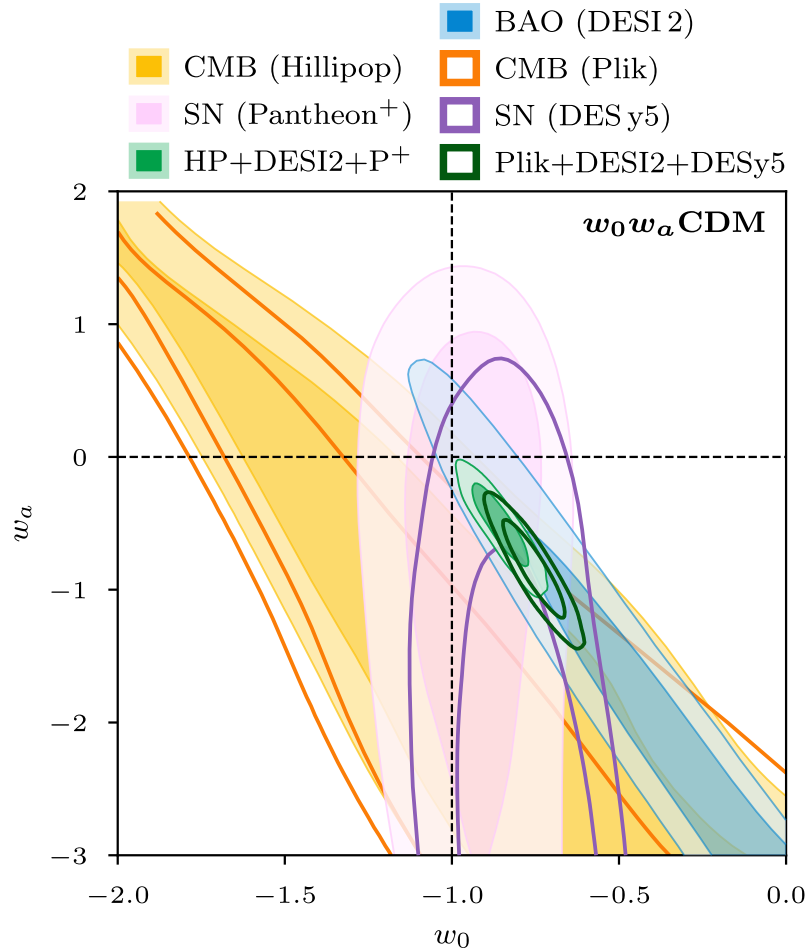

# The “Curvature Tension”

- $\Lambda$ CDM extension with curvature density parameter  $\Omega_K$
- Tension around 2018:
  - $2.3\sigma$  between Plik and lensing.
  - $3\sigma$  between Plik and SDSS 12.
- BAO update:
  - Reduces to  $2.5\sigma$  with SDSS 16 or DESI 2.
- CMB update:
  - Goes away with CamSpec or Hillipop.
- **Takeaway:**  
Tension after *opening* parameter space!

# Evolving Dark Energy $w(a)$

Takeaway:  
Cosmologic Constant Tension highly dependent on choice of dataset combination.

100% 10% 1% 0.1% 0.01%  $p$ -value

## Tension

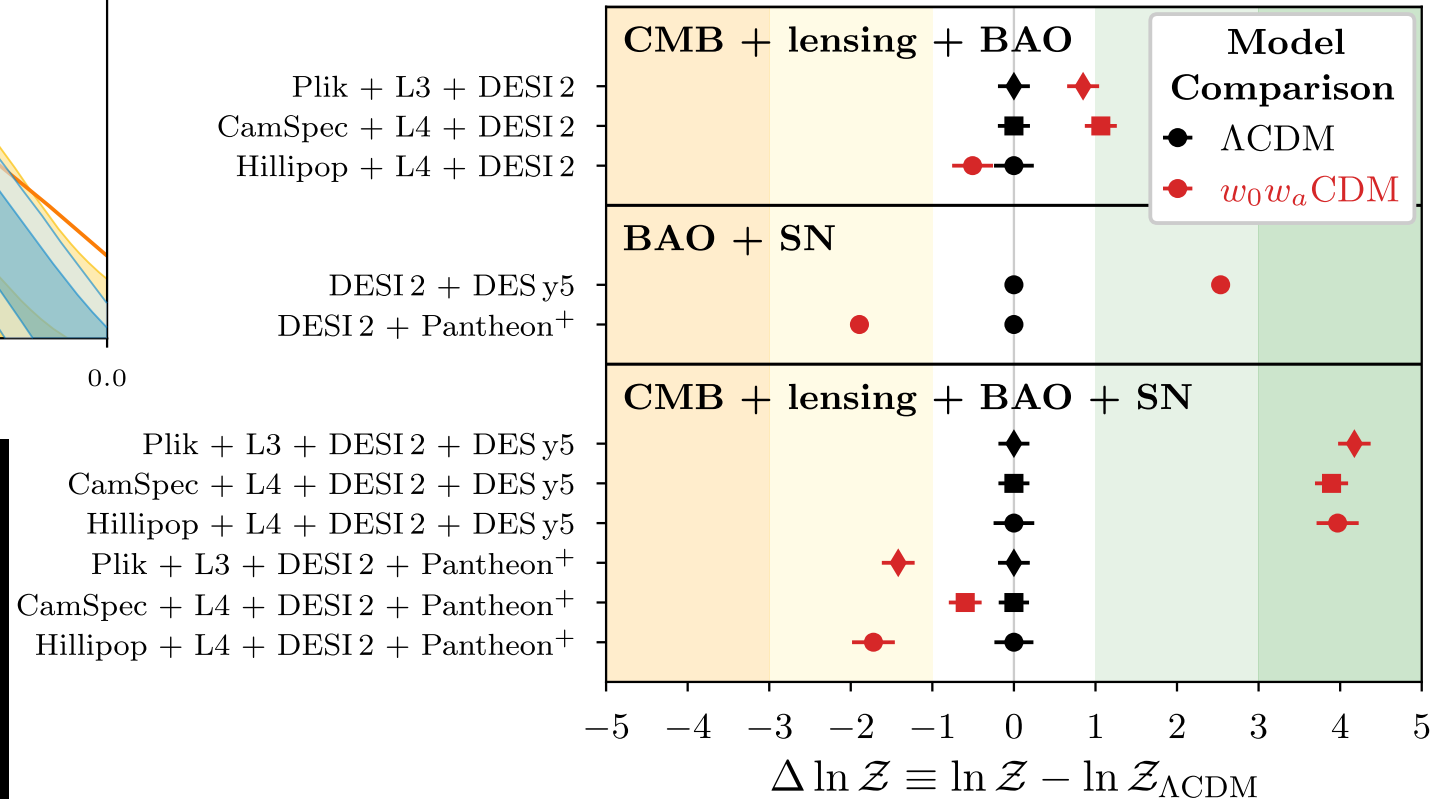

# Evolving Dark Energy $w(a)$

Takeaway:  
Model preference completely flips with  
SN likelihood.

## Model Comparison

Lukas T. Hergt

# Planck, ACT, SPT

- ACT or SPT on their own: no tension with BAO
- Signs of tension only in combination with low- $\ell$  from Planck.

# Conclusion

- Hubble Tension the only one clearly over  $3\sigma$  threshold.
    - Still persisting after first JWST updates.
  - Tensions vary with choice of CMB likelihood:
    - $0.5\sigma$  to  $1.5\sigma$ .
    - Trend: tensions reduce from Plik  $\rightarrow$  CamSpec  $\rightarrow$  Hillipop
  - Tensions vary with choice of SN likelihood:
    - $-1\sigma$  going from DES-y5  $\rightarrow$  Pantheon+
    - Model comparison switches from “strongly preferred” to “disfavoured”
  - Many tensions have reduced over time with analysis updates:
    - Clustering tension between Weak Lensing and CMB.
    - CMB low- $\ell$  vs high- $\ell$  or CMB vs lensing with updates PR3  $\rightarrow$  PR4.
    - SN update DES-y5  $\rightarrow$  DES-Dovekie.
  - Curvature tension?
    - Model preference and tension go away with Planck updates
  - Cosmological Constant Tension and preference for  $w_0w_a$ CDM?
    - Only specifically for Plik + DESI + DES-y5
    - Gone with Hillipop + DESI + Pantheon+
- $\rightarrow$  Claims for a needed update from  $\Lambda$ CDM to  $w_0w_a$ CDM are premature.

A composite image of the universe. The top half shows a dense field of stars, some with spiral patterns around them, set against a dark blue background. The middle section features several galaxies, including a prominent one with a bright yellow core and a reddish, elongated structure. The bottom portion shows the curved horizon of Earth from space, with a thin layer of atmosphere and a view of the planet's surface. The text "Backup slides" is centered in the middle of the image.
